# LAURISTONS.

By JOHN OXENHAM,
Author of *Barbe of Grand Bayou, Giant Circumstance, John of Gerisau, Great-Heart Gillian*, &c.

## CHAPTER I.—HOW THEY PLAYED IN THE LAND OF MAKE-BELIEVE.

The appreciation of such an act places us in the terrible alternative of blaming virtue or applauding crime. . . . We must leave this mystery to be debated in the abysses of the human heart. . . . There are deeds of which men are no judges, and which mount without appeal direct to the tribunal of God. . . . There are human actions so strange a mixture of weakness and strength, pure intent and culpable means, error and truth, that we know not whether to term them crime or virtue.—LAMARTINE.

'ANY signs of the en'my, sergeant?' asked a clear, girlish treble in the concentrated suppression of uttermost make-believe.

'No.' And after a searching glance all round, with special consideration of the thickets and pollard-oaks and willows along the river-bank, the patient sentry, with the wooden gun on his shoulder, stolidly resumed his beat. It carried him to and fro across the landward neck of a tiny peninsula formed by a freakish twist of the stream, and the clearly defined path he trod bore testimony to much similar travelling by his or other feet.

On the one side the meadow-land swept gently up towards Castle Bear and Hanger Hill, where here and there a stately mansion stood among its elms and oaks. The double row of willows on the river-banks rambled east and west in hap-hazard fashion, like wavering lines of grenadiers flickering across country under a heavy fire. Just behind him was the tiny peninsula, all a dense thicket of whitethorn and guelder-rose and bramble-bushes. And, shouldering up out of the tangle, as though at some time of his life he had had to fight for it, and still felt the effects, was a very aged pollard-oak; his inside was hollow and blackened—indeed, a thin, blue curl of smoke hung about him at that moment, but it did not seem to trouble him in the slightest. Nay, from the jovial look of him, one could almost have imagined that he enjoyed a fire in his inside as much as the fire-makers themselves. His lower branches disported themselves as a natural staircase, the higher ones round his stunted crown as a watch-tower. Obviously, an oak of parts and of importance in the world.

On the other side of the river, where the buttercup and dandelion studded meadows rolled up to an elevation of quite six feet, a tiny church, with gray walls and red roof and stunted spire, looked proudly down on the capricious stream and the lower lands, as it had looked for close on seven hundred changeful years.

The thicket was tunnelled here and there with runs which permitted entrance—to bodies of a certain smallness and on rigidly enforced toll of fragments of skin and clothing—to a few feet of cleared space round the old oak. One still lusty bough stretched temptingly over the water, into whose clear, brown depths the thickset bank dropped abruptly. The stream, still jubilant with the spring rains, coiled here and there in pools where plump, suspicious-eyed trout waggled lazily to and fro and turned up scornful noses at all amateur attempts at capture. But for the most part it swept merrily over stretches of yellow gravel, where the sunbeams lay like golden bars, and its steep banks were thick with white violets and forget-me-nots.

In commonplace matter-of-fact, the little stream was only the Brent winding through the county of Middlesex to the Thames. But in the ampler world of make-believe it was the mighty Mississippi rolling onward to the Gulf—delicious words, conjuring up what of wonder and romance to outreaching souls overlarge for small bodies even in those days when Louisiana still belonged to France! And what finer in the way of frontier fort could heart of man desire than this hollow oak and this tunnelled thicket, with the brown Brent waters swirling at their feet?

'I do wonder what's become of them,' came the voice from the thicket again, with more than a touch of impatience in it.

'There's Charles now!' said the sentry, standing stolidly to gaze at a distant point along the river-bank.

[*All Rights Reserved.*]

'Charles! Who's Charles?' somewhat of impatient disgust and much of rebuke in the voice from the fortress this time. 'I do wish you'd remember where you are, John Sax—sergeant, I mean.'

'Oh, well,'—and the thoughtless sentry flushed, as one caught tripping again after much futile tuition—'Red-Eagle, then. And I b'lieve he's hurt himself. He runs a bit, and then falls down and wriggles on his stomach. There! he's down again!'

'Silly! He's tracking us across the prairie by the blades of grass we trod on, and'——

'But we didn't come that way. We came straight across, and he's crawling along down there among the bushes.'

'And if he came straight across wouldn't we see him and shoot him dead in his tracks, and doesn't he know it? John Sax, you haven't any 'magination at all!'

At which the sentry's honest face warmed again. He half-turned towards the thicket, as though to resent the truthful imputation, then said tersely, 'I can see him as plain as my foot; but I'll pretend not to, till he gets close enough. Then I'll run out and knock him down.'

'You challenge him three times—"Who goes there?"—and if he doesn't give the password you shoot him dead. What's the password?' warningly.

'Mavie!' quick enough this time.

'Well then, don't you go and forget it! Can't you see anything of the Frenchman?'

'No, not a bit of him,' after a searching glance along the other bend of the river-bank, and careful survey of every tree and bush. 'Perhaps he's gone across to the other side and is creeping up that way.'

'No, he's not. He can't be. That's Louisiana, and it's out of bounds, and we're not allowed to go across. Charles—I mean Red Eagle—would tell him. Besides, I told him myself.'

But John Sax shook his head. He knew the Frenchman and his ways. With another look at Red Eagle, to make sure that he was not getting too close, he marched to the end of his beat upstream and cautiously examined Louisiana from that point of view. Then to the down-stream end, and at the first glance over the forbidden land cried, 'He's there, Mavie—General, I mean. He's creeping up under the bushes to get across by the plank. Hey, you! who goes there? Give the word or I'll fire.'

'You 'tend to Red Eagle. I'll see to the Frenchman;' and up the old oak from branch to branch, as active as a squirrel, climbed the General, a black smudge across her red-hot face, her eyes blazing with indignation at this abominable breach of faith on the part of the Frenchman.

'Etienne de Montessonne, you're a cheat, and if you can't play fair you sha'n't play at all! That's out of bounds, and you've no right to be there.'

'Why, then?' and Etienne came out of the bushes to discuss the question.

'Why! 'Cause Louisiana's out of bounds, and we've given our word, and when we give our word we stick to it. That's why.'

'I've never given my word, and I'm a Frenchman, and Louisiana's French. So there! I've a right to be here.'

'No, you haven't. When you've given your word it's dishon'rable not to stick to it.'

'But I'——

'Lauristons—and Saxes,' as her eye fell on the worshipful face of the sentry below—'always stick to their words.'

'And so do Montessonnes. I'd like to find any one that said they didn't.'

'Well, I say so. So there! Lauristons—and Saxes,' with intense scorn, 'would sooner be cut into tiny little pieces than do anything dishon'rable.'

'Well, so would'——

Then, with a blood-curdling war-whoop, crafty Red Eagle, unmistakable with the red feather tied rakishly over his left ear, hurled himself on the negligent sentry and bore him to the ground, and the General up aloft danced on her perch with indignant excitement, and then came scrambling down to straighten matters out with her vehement little tongue.

'Let be, Charles! Let be! Oh, stop, both of you, and get up! We're not playing now because your side didn't play fair;' and she made frantic grabs at the bundle of writhing arms and legs at her feet. 'Stop, I say!—stop! both of you!' and, hopeless of making any impression any other way, she danced wildly round the strugglers, administering impartial kicks whenever opportunity offered.

Chances of battle, and perhaps an extra modicum of dogged strength, brought the guardian of the fort suddenly uppermost. But before he had time even to realise his victory the vehement hands of his General tore him off the foe, and both boys were on their feet, panting and laughing with the enjoyment of the fray.

'I say, Mavie, you can kick!' said her brother, rubbing his leg with exaggerated affliction.

'Well, you wouldn't listen any other way. Etienne crossed the river, and it's not fair. Oh, look! look!' and she gripped their arms in an ecstasy of surprise as a fox sped out of the bushes and swept like a streak of light across the plank, and they became aware of a distant clamour of yelping dogs and shouting men drawing towards them along the river-bank, though still invisible by reason of the bushes.

Etienne had been just about to cross the plank when the brown body flashed past him so suddenly that he fell back with a yell, and then stooped to hurl a stone after his discomfitor. But Reynard was already in sanctuary through the little churchyard, a device he had doubtless employed times without number for the checking of a too hot pursuit and the snatching of the precious minute that landed him safely on the side of Horsington Hill.

When Etienne turned again to the plank he saw Mavie tugging at it with both hands, her face ablaze

with excitement. Charles and John Sax jumped down and tugged also, but ineffectually. Then John Sax, slow of wit but full of common-sense, crawled under the plank on hands and knees, and raised his sturdy back with every ounce that was in him. The plank moved, rose with a sob, and under the impulsion of the other two, fell with a splash and went joggling away down-stream.

Mavie straightened herself with a sigh of relief and a triumphant 'There!' just as the ardent pack came frothing up and scattered like a living bombshell along the river-bank, with angry yelps and twisting noses and gleaming eyes and teeth.

There was no time even to be frightened.

'Go 'way!' cried Mavie, hammering at them with her fists, while the boys kicked out right and left; and then John Sax dragged her away along the bank.

The General knew every inch of ground hereabouts. Just ahead gaped a tunnel-way up into their thicket, and in a moment they were all scrambling up the old oak, Mavie's sparkling face showing her vast enjoyment of the adventure, John Sax's somewhat startled at the novel experience, Charles's alone agog with amazement at the sight of hounds after a fox in the month of May.

But a glance down at the yelping crew told him what had happened. Some were still coupled in the leashes, and broken thongs dangled from the necks of the rest. The pack had been out for exercise, when Reynard—from lack of thought or of malice prepense, and pining for a run—crossed their path and led them into evil courses.

By the time the keepers came up, too breathless even to curse, the dogs, quartering the bank to and fro, had discovered the plank aground in a shallow and still excitingly odorous. They gathered round it, leaping and yelping, heedless of everything but the fact that the fox had passed that way; and the men ran in and secured them as best they could with the broken thongs. Then, with clamour of recovered curses and much cracking of whips, the dogs were dragged back to straiter paths, with lust of death in their panting jaws and eager eyes, and wild yearnings for the joy of life, and much puzzlement as to the why and wherefore of things.

'Horrid things!' commented the General from her perch, in the still present perturbation of her late undignified flight.

'Beauties!' said her brother admiringly.

'Pooh! All after one poor little fox!'

But John Sax was staring at a tear in the sleeve of her frock.

'They didn't bite you, Mavie?' he asked anxiously.

'No, I don't think—I don't know,' hotching the arm uncomfortably now that her attention was called to it.

'Let's see,' said John, and pushed the sleeve up, baring the little, white arm; and then, at sight of discoloured flesh and a spot or two of blood where the long eye-teeth had pierced, he bent forward suddenly and set his lips to the wound and sucked as hard as he could.

'Oh!' cried Mavie; but he held her tight and sucked away. 'You hurt me a great deal more than the dogs, John Sax!' she cried.

'Be quiet, Mavie!' said Charles authoritatively. 'It's the proper thing to do. Like Cœur de Lion, you know.'

''Twasn't, then! It was Edward the First.'

'It's all the same. You have to suck it to get the poison out.' And so, as it was the proper thing to do, and Edward the First had had it done to him, Mavie submitted till her medicine-man was purple in the face and he could suck no more.

'Now we'd better put that plank back in its place or somebody 'll walk into the river in the dark,' said John Sax as soon as he had got his breath back; and they scrambled down and set to work on the reinstatement of the plank.

But this was a day of quite unusual diversions. They had played there for weeks at a time without ever seeing a soul, save in their own lively imaginations, which peopled all the country-side with lurking enemies, red and white. But now they had barely managed to get the other end of the plank floated across-stream, and the impatient Etienne had drawn it up into its place, and they were stamping their end into security, when the Frenchman gave a shout, and whirled his arms ecstatically, and set off running at top speed towards the little church.

And then the others saw what their preoccupation had hidden from them—a long, glittering line of mounted soldiers winding down the road that led past the church and manor-house; and in a moment boundaries, and orders, and given words, and nice questions of honour flew with the wind, and they were all in as hot pursuit of Etienne as the hounds had been of the fox a few minutes before. For these were stirring times at home and abroad, and the pomp and circumstance of war held all youthful minds in thrall, and the sight and sound of warriors in the flesh drew all movable youthful bodies as surely as did the pipe of him of Hamelin.

Across the buttercup and dandelion bedecked Louisiana then, past the little church-tower, and into the road, glowing and panting, just in time to see the great, smooth-skinned, gray war-horses and the mighty ones they carried. Such champing of bits and tinkling of steel chains! Such clanking of swords, and gleam and glitter of white belts and epaulettes and buttons! Such grim, grizzled, shaven faces below the tufted head-dresses! Such hard, kindly eyes turned appreciatively on the huzzaing little hero-worshippers in the mud below!

A smiling glance from above that clicked on a hungry look from below, a motion of the hand, a bending down and a grip, and Charles was seated in triumph on the bumpy discomfort of the cornet's pommel and holsters.

But what are raspings and bruisings of unaccustomed legs on unaccommodating lumps and unyielding ridges of stiffened leather? What the fact that the knobby projection of the pommel greets the

base of one's small spinal column with a paralysing jar at each step of the mighty war-horse? What even the still more poignant fact that the tooth of a holster-buckle is drawing blood from the inside of one's small, tightly clinging left leg? What are all such trifles as these—what is anything in the world—compared with this mightiest fact of all, that here we are actually astride of Bucephalus, with clink of chains and rattle of arms and accoutrements all about us, in fearful but delightful proximity to a haughty curving neck, and a tossing gray mane, and a pair of nervously twitching gray ears which duck up and down and eclipse the back of the man in front every second; while the trees and hedges flit mistily by on either side in a series of joggling jumps, and the muddy road below swims past as if it were a rushing stream?

And below there, too, somewhere between us and the muddy torrent, but a long, long way below us—oh! miles away below us—a sweet little face, glowing with pride and admiration at our daring, and a pair of brown eyes ablaze with longing to do likewise! And it was no lack of invitation that kept her trotting in the mud, you may be sure. Many a great gauntleted hand had proffered her welcome to similar precarious height. And she would have liked—oh, how she would have liked!—to cling to one and scramble up as Charlie had done! But, valiant General and Commander of a Frontier Fort as she was, and no whit behind her companions in mighty deeds in the privacy of the fields and woods, here maidenly doubts assailed her as to the absolute propriety of mounting in front of one of these gorgeous men of war, and possibly having to sit astride his pommel as Charlie was doing.

So she trotted alongside in the mud, with cheeks aglow and longing eyes; and Etienne trotted close behind her, jerking out his enthusiasm in such palpable French that the stalwart Englishmen scowled down at him, and wondered what the *et cetera* he did there, but extended no invitation to him to mount.

And John Sax trotted doggedly behind, wondering confusedly what had become of given words and promises as to boundary-limits, but vaguely trustful that, since Charles and Mavie did it, it must somehow be all right, or at all events not absolutely and beyond all question wrong.

But, as the leading files turned into the road that led through Alperton towards Harrow, Charles awoke from his dazzling dream to sense of trespass and the breaking of bounds. He turned his bright face up to his own particular warrior and jerked, 'Thank you—so much! It's splendid—but we're out of bounds—and I must go;' and he wriggled round to slip off. 'Are you—going to the—wars?'

'If the chance comes.'

'Good-luck to you, then! I'm going—to be a soldier too—when I grow up.'

'What name—and I'll look out for you?' in quite a matter-of-fact voice, with no provoking hint of laughter in it, but as between man and man, and as though he really meant it.

'Lauriston—Charles Lauriston.'

'Ah!' and he seemed about to say more, but Charles had slipped down and was standing in the mud, with Mavie and the rest of his company bunched alongside; and they stood there waving and shouting till the long procession of glossy skins and tossing manes and tails, and their wonderful riders, had passed.

And when the last red coat and the last gray tail had flickered away out of sight, Charles turned, with his sense of trespass emphasised by the emptiness of the muddy road, and without a word led his company back past the little church, across the river, and up the rolling meadows towards Castle Bear and home.

*(To be continued.)*

# MARS AS A HABITABLE WORLD.

By Alexander W. Roberts, D.Sc., Lovedale.

During the autumn of 1909 the brightest star in the sky has been, without doubt, the planet Mars. Its fierce, ruddy glare, like fire glowing on a brazen hearth, could not fail to attract, and even to hold for a space, the attention of even the most casual and indifferent beholder. As one watched it slowly climb up the eastern evening sky, peerless in its glowing splendour, one understood how the ancient folk associated its fiery, almost baleful, light with tumult and war and dire disaster. It seemed to menace men and nations.

Yet, perhaps, during the autumn of 1909 another star divided with Mars the honour of being first among the lights of night. Away down in the western sky, softly white against a daffodil radiance, hung Venus. It was thus no ordinary phenomenon that one looked upon. Guarding the eastern and western portals of the sky were two supremely beautiful stars, one ruby-red, the emblem of battle and passion; the other pearly-white, even as the spirit of purity and peace. Between them, and filling the dome of night with their beauty and variety, shone the myriad and many-coloured gems of the sky.

The writer has it in purpose to say something about both of these stars, our Earth's nearest neighbours, Venus and Mars. Because of its more immediate interest at this date we may consider the latter planet first.

Now, so much has been written regarding the appearance of Mars during 1909—and much more will yet be said—that one moves forward to any

further statement in a spirit of apology. Yet, after all, there need be no apology, for fewer astronomical questions have raised a wider or keener interest among all classes of men, the scientific and the non-scientific, than those which gather round the planet Mars, and are concerned with the possibilities of life existing on its ruddy shores. With a strange insistence that will not be denied, the man in the observatory and the man in the street, the novelist and the scientist, have fastened their thoughts on this neighbouring world as the one which seems most likely to fulfil the longing that almost all thoughtful men have to discover life and intelligence outside their own world, and, if possible, to enter into communication with it.

Whether this concentration of interest on one star out of the thousands upon thousands that shine in the sky is the outcome of an instinct that some day will have its justification, or whether the recent very remarkable discoveries connected with the physical features of Mars have drawn the minds of men in the direction of considering this planet as a habitable globe, one cannot say. Perhaps both influences operate, the result being that our papers and magazines are full of articles on Mars, that men speak with confidence of signalling to it, and that one astronomer of repute has even urged the spending of a million of money on the enterprise.

This being the present position of intention and expectation as regards interplanetary communication, it may be of some interest to gather into a brief article what is known regarding the possibilities of life upon Mars. I have in an article, 'Are the Stars Inhabited?' published in *Chambers's Journal* for July 1904, considered the question from a much wider standpoint than I shall do in this paper. Nevertheless, this paper is a continuation and a special application of the former article.

Now, it may be urged, why all this excitement about Mars during 1909? Is its appearance in 1909 different from what it will be during 1910 and 1911, or from its appearance in any other year? Most assuredly yes. Not since 1892, and not again till 1924, will Mars be so near the Earth, and consequently so bright, as it was in September of 1909. And it may not be lacking in interest to indicate how this variation in nearness and brightness comes about.

As is well known, none of the planets move round the sun in perfect circles. The path of each is more or less eccentric, some moving in an almost circular orbit, and others again along a much more eccentric path. Thus, for example, the orbit of the Earth may be regarded as a circle with a radius of 92,800,000 miles. This orbit it completes in three hundred and sixty-five and a quarter days. Immediately outside the Earth lies the very eccentric orbit of Mars.

A distance of 128,200,000 miles marks the nearest approach of Mars to the sun, and a distance of 154,600,000 miles its farthest sweep. This elliptical orbit it describes in six hundred and eighty-seven days. This is the length of the Martian year, so that it moves much more slowly along its path than our Earth does. As each body circles round the sun it is evident that the Earth, like the swifter of two runners on a circular racing-track, will pass Mars each lap. And it will be also plain that the condition governing a near approach of Mars to the Earth will be this simple one, that when the Earth passes Mars, the latter planet is at that instant near the sun—the nearer the better.

Now, this condition is fulfilled but rarely. It was fulfilled in 1877, when the two moons of Mars were discovered. It was fulfilled in 1892, when some new and delicate markings were detected. It is fulfilled this year of grace 1909, when great things are expected in the way of delineating Martian topography. It will be fulfilled again in 1924, when a very near approach will take place.

Indeed, there are only half-a-dozen favourable approaches during the twentieth century, namely:

| | | | |
|---|---|---|---|
| **September 24, 1909.** | **Distance,** | **36,500,000** | **miles.** |
| **August 24, 1924** . | " | 35,400,000 | " |
| **July 23, 1939** . . | " | 36,200,000 | " |
| **September 11, 1956.** | " | 35,500,000 | " |
| **August 10, 1971** . | " | 35,800,000 | " |
| **September 28, 1988.** | " | 36,900,000 | " |

A glance at the above table will indicate that favourable approaches of Mars to the Earth take place every fifteen or every seventeen years. A still more perfect cycle is seventy-nine years. In this cycle there are five favourable approaches, and these repeat themselves at intervals of seventy-nine years and a few days.

If from the distance which separates Mars from the sun at its nearest approach (128,200,000 miles) we subtract the Earth's distance from the sun (92,800,000), we obtain the nearest distance that we can ever hope to get to Mars, roughly 35,000,000 miles. We emphasise this fact because, in the buoyant exuberance of hope regarding the possibility of signalling to the possible inhabitants of our neighbouring world, the immensity of the gulf that separates us from that world is forgotten. Even if we used telescopes magnifying two thousand times, we should still be looking at Mars as it would appear to the naked eye at a distance of 18,000 miles. Further, under the best conditions of seeing, we should be trying to detect details through 200 miles of shimmering, perturbing, distorting air. How large, we ask, would the object require to be that we should see clearly and distinctly, with our unaided eyes, at a distance of 18,000 miles? Then, just as large would the signal require to be on Mars that we should discern with the most powerful telescopes at present in existence. This is not a question of theory, it is a matter of plain fact. Then it seems to be entirely forgotten by those who speak with confidence of signalling to the planet Mars that when *we* are able to see the planet most distinctly, and under the most favourable conditions as to distance, dwellers on Mars, if there be any, cannot see the Earth at all, for it is then hidden in the brightness of the sun's rays.

A moment's reflection will make this clear. When Mars is at its nearest approach to us it is on the opposite side from the sun. It is then 'in opposition.' But when to our Earth Mars is in opposition, our Earth to Martian astronomers is in conjunction; that is, to them the Earth and the sun are practically in a straight line. Thus, if during September 1909 the whole earth were set on fire as a signal, not a soul on Mars would have an inkling of the catastrophe. When the time came for the Earth to emerge from out the sun's rays as a morning star, they might wonder what had happened to it, or where it had got to, but that is all!

That we shall ever be able to signal to any of the planets either by light-flashes or by powerful electric waves is very questionable. Personally, I have the hope, shared by not a few, that the veil which hides from view life on other worlds will never be lifted in our time. Consider the burden we should have to bear if each morning we were inundated with tidings from Jupiter, from Mars, from Venus, from the million and one worlds which fill our sky. And if, in addition to the many problems we have yet to solve, we were submerged under an avalanche of questions from all the philosophers, politicians, theologians, cranks in the four corners of the universe, life would be impossible.

Now, although the space that lies between us and Mars is vast enough to prevent our ever signalling to it, yet, chiefly due to the indomitable patience of Professor Lowell, of Flagstaff Observatory, United States, and two or three other outstanding men, we have been able to discover a great deal regarding the physical features and topography of the planet Mars. Indeed, we know far more about it than we do about any other planet or star in the sky. Thus, to take some of the longest established facts first, we know that Mars rotates on its axis in almost twenty-four hours, so that the Martian day is the same length as ours. We know also that it has seasons just like our Earth, for the axis of Mars is inclined twenty-nine degrees to its orbit—our Earth's inclination is twenty-three and a half degrees. True, its year is nearly double as long as ours; but that is not a serious difficulty. The human race could easily accustom itself to a year of a thousand days! Then the presence of snow at the poles, or what appears to be snow, is proof of the existence of vapour, and vapour means an atmosphere. Apart from this indirect proof, the spectroscope has proved indubitably the presence of vapour on Mars. So that we find on Mars day and night even as on our own Earth, spring and summer, autumn and winter, snow and ice, rain and dew, soft-blowing breezes, and the ever-changing colours of growing vegetation. So far, Mars is not unlike our Earth. But we also find on Mars much that has no counterpart on these shores, much that we should find not only utterly strange, but very, very speedily fatal.

To take one simple yet far-reaching difference: the diameter of Mars is only a little more than one-half that of the Earth, namely, 4230 miles; and the density of the materials which go to make up this lesser planet is only one-half that of the substances which form our Earth. This means that on the surface of Mars the force, the restraining force, of gravity is only one-third what it is with us. But a weakening of the grip of gravity means a thinning of the atmosphere to a corresponding amount. Thus at the surface of Mars the atmosphere, the Martian atmosphere, is as rare as the atmosphere at the top of our highest mountains. This is not merely an indirect deduction. It has been proved both by the telescope and the spectroscope that the atmosphere on Mars is at least a tenth the density of ours. Whether any life under such conditions is possible we dare not say. This we know, that life as we understand it, and conditioned as we experience it, is not possible with an atmosphere so rare as exists on Mars.

But the rarity of the Martian atmosphere has a further sequence of results besides this inability to support terrestrial life. There can be little or no evaporation from the surface pools and canals even though water boils on Mars at one hundred degrees Fahrenheit. Thus clouds rarely screen the tortured ground from the sun's heat by day or shelter it from the terrible cold of space by night. Again, this is no indirect deduction. The fact that we can *at all times* see clearly the surface-markings of Mars is direct proof of the non-existence of clouds. Further, the darker patches on the surface which at one time were held to be seas are now known to be large tracts of vegetation of some kind, so that water, if it exists on Mars, is confined to the poles, the strange canals, and any small streams that may meander through the forest regions.

Thus Mars would indeed be a sad and dreary world for any Earth-dweller to live in. One could dig a grave easily, for the soil there is lighter and shovelling less burdensome than on these shores; and graves are what would be before us did any of us reach the inhospitable, waterless, windless, cloudless Martian shores. The monotony, also, would be appalling. No mountains have been seen on its level lands, only vast stretches of plain crossed hither and thither by what we children of Earth call canals; though what we would term them were we on Mars is another story. Then there are no restless, health-giving seas; no flowing, gladdening rivers; no smiling lakes. The whole view breathes a death-dealing monotony. One feels the stagnation at a distance of 35,000,000 miles.

If human beings are somewhere on these distant plains, on these vast Martian savannas, then their thoughts, their outlook, their whole condition of life must be so different from ours that it would take us a cycle of centuries to understand them and their language, were it possible to communicate with them. Men living in the Stone Age or in any prehistoric period of the world's history would be infinitely nearer us in thought and feeling than the dwellers on a globe

Where falls not rain, nor snow,
Nor any wind blows loudly.

Yet there are those—and among them men who command attention because of their great attainments and important achievements in science—who say that Mars is inhabited. What arguments do these men advance in aid of their contention?

The polar snow-caps on Mars are about the earliest topographical discoveries connected with the planet. More than a hundred years ago it was proved by Sir William Herschel that these polar snow-caps varied with the seasons; nay, further, he proved that the colour of Mars also changed with the seasons. Oliver Wendell Holmes's lines will be familiar to many:

The snows that glittered on the disc of Mars
Have melted, and the planet's fiery orb
Rolls in the crimson summer of its year.

The dark and light shading on the surface was a very early discovery; but thirty years ago it was noticed by Schiaparelli that the whole surface of the planet was intersected by a number of fine lines which also changed in intensity as the seasons changed.

The recent discoveries of Lowell at Flagstaff will be fresh in the minds of most: how he traced the melting of the snows at one of the poles when its summer was drawing nigh; how he watched the slow widening of the canals from the polar area outwards to the equator; how the colour of the dark and bright areas changed as the polar water apparently reached them; how the ever-widening process at length reached the equator, and finally the opposite pole from which the movement started; then rest for a space, only to have the phenomenon repeated again from the pole that the water had just reached—melting snows, widening canals, changing fields, and then the pole again. Lowell found that this whole circulation from pole to pole, and back to pole again, was completed in a Martian year.

Professor Lowell's explanation is that as the northern summer on Mars draws nigh the northern polar cap begins to melt, and the melted snow finds its way southwards along the canals that have been dug by Martian dwellers, whom dire necessity has made great engineers. All along the canals are sluice-gates and lesser waterways, and by these rills and furrows the precious water is led on to the Martian fields. Hence the seeming widening out of the canals, and the change in colour of the fields from bright orange to dark olive, and then to green, as the Martian vegetation grows. Reaching the equator, the water is still forced southwards, till in six months' time it reaches the south pole and is there frozen, only to appear again as a life-giving stream of water when the southern summer dawns. Then once more the canals open out, but this time the trend is northward; once more a garment of green covers the dreary Martian plains. The duality of some of the canals is explained on the ground that overflow channels would frequently be required. The round-like marks where many of the canals intersect, Professor Lowell regards as huge reservoirs into which the water from the canals is pumped.

There is something fascinatingly interesting about this explanation, about this vast hydraulic system. And what is more, the observations tally with theory. The snow-caps are there, the widening of the so-called canals is there, the chameleon fields are there, the apparently circular reservoirs are there; they have, indeed, all been photographed, so that it is not a question of the eye seeing what it wants to see.

Yet most astronomers are unwilling to accept these explanations of the observed Martian phenomena. One difficulty at once presents itself: how does the water which nourishes the fields and thereby produces such a magnificent growth of vegetation get back to the canals? Then, again, there is the simple fact that all the water obtained from the melting snows would be evaporated long before it reached the equator, as evaporation is three times more active on Mars than on the surface of our Earth. Against this it has been urged that the canals are mammoth water-pipes! Take also the difficulty of forcing water through 60,000 miles of waterways! However smooth the banks of the canals might be, the resistance due to pressure and friction would be enormous. No body of engineers on our globe would face the problem, for compared to it the construction of the Panamá Canal would be like making a child's furrow in the sand. True, the ancient Egyptians raised great blocks of stone in some unknown way, and it is just possible that Martian engineers may be thoroughly acquainted with forces that we have never even thought of. But admitting all this, water would still be water on Mars; and this being so, it seems an impossible feat to force it from one pole to the other through open waterways.

Professor Pickering, of Harvard, suggests that the canals are cracks on the crust of Mars through which carbonic acid gas escapes. In the northern summer, for example, the heat of the sun would expand the soil, and thus force out the imprisoned gases. We know the effect of carbonic acid upon vegetation, but we also know its effect upon animal life; and so, if Professor Pickering's theory of the seasonal exudation of carbonic acid be correct, then human life, as we know it, on Mars is impossible.

Then, again, the suggestion is made that the canals may be long lines of plantations, such as one often sees in new countries where forests grow in long strips. But how the trees receive their water is thus left unexplained. True, there may be very heavy dews on Mars, as there are on most tropical countries and on all lands where the difference between the heat by day and the cold by night is very great. On Mars the diurnal changes in temperature must range through one hundred degrees Fahrenheit. Would life under such extremes be even tolerable?

Every astronomer has a theory about the Martian canals, and the writer has his. His view is that the canals are cracks caused by the long winter cold—the Martian winter lasts through nearly twelve of

our months; that these cracks are filled with ice; that as the summer advances the ice melts; that the Martian soil expanding under the heat of summer forces out the water into the adjacent fields. The difficulty is to get the water back again into the cracks; but no theory is perfect.

And now to sum up all that has been said in this article. The question which the title suggests is not what are the possible explanations of the Martian markings? but can life, as we know it, exist on Mars? True, the question of life existing on Mars is most intimately bound up with the various phenomena we see on its surface; for if it can be proved that there are mechanical changes taking place on Mars, changes in no way due to physical causes, but which are connected in some way with rational, thinking beings, then we must conclude that intelligence of some kind—it matters not what the outer garment of that intelligence may be—exists on Mars. As we have already indicated, the mechanical-looking canals of Mars are said by many eminent astronomers to be the work of intelligent beings. No physical forces could produce them, could secure their almost geometrical regularity of design. Then, again, it is averred that the changes one sees taking place on Mars are just those which we might expect thinking men to desire and to labour for. That the magnitude of their enterprise is greater than any on Earth could attain to is no counter-argument for the inhospitality of their world; its poverty in all that makes this world rich and fertile and beautiful may have made the Martian men wise, strenuous, daring. Yet there is no getting away from the physical drawbacks to life which exist on Mars: the tenuous atmosphere, the terrible drought, the fierce extremes of cold and heat.

We can only reason from what we know. There are no doubt boundless possibilities of life in a boundless universe, but as far as our judgment is concerned we can only bring to bear upon the problem the touchstone of our own experience; and when we deal with the problem of life upon Mars thus, we must unhesitatingly say that life as we know it is impossible upon Martian shores.

# THE FORGOTTEN ROCK.*

By JOHN FOSTER, Author of *The Luck o' the Spey*, &c.

## CHAPTER I.

**There the aged north wind sporteth**
**With the glassy waves of ocean.**

LOOK down on a sunny day from some heathered slope on Speyside towards the Firth, and see in the shining distance a long palette of bright sand bordered by creaming seas; at its eastern corner a tiny sepia speck, with perhaps a faint trail of smoke lingering round it; near it, the bright white column of a lighthouse straight and definite in the sun.

The little speck is the port of Findburgh, held between the Findhorn and the Spey in the rugged, tender grasp of the Moray Firth's long white arm. Brown sails of fishing-boats, the funnels of a few unclean cargo-steamers and little, squat 'drifters' or 'liners,' and the tall spars of sailing-ships people the harbour. For the rest, the girdle of gray, wrinkled seas; dull streets, colourless save for a public-house mirror and a flaming eye in the chemist's window; ugly, featureless houses; a peculiarly drab 'square' of waste land blanketed by sprawling burnt-umber nets, flanked by grim, opposing kirks of austere and quarrelsome Scots sects; gaunt firs neighbouring an inhospitable shingle, their shuddering heads bent southwards, away from the clutch of the north wind, join forces in hastening the impression of a dull monochrome, saved from abjectness by an invincible nobility in its environments—the majestic curve of sand of the bay; the clean masculine airs; the wine and colour and movement of life of the crested seas that carol and dance along that wind-swept and reverberant shore.

Serious-looking men dwell there—fisher-folk, with long Scots upper-lips; the older men with Calcraft beards fringing tanned faces; all of them with a stolid gaze for strangers and the laconic speech of a curiously detached community. For Time's tide, racing past, has left in its backwaters many such little towns untouched here and there along that coast. Old-time speech and superstitions linger there. Countless 'tee' or distinguishing nick names fall quaintly on the stranger's ear; the names springing from a hopeless network of intermarriages, for the fisherman of the North-East rarely marries out of his little town or his circle of fisher-friends or relatives, and the same baptismal name may be held by a score of them. Ashore, like the ploughman in *A Lowden Sabbath Morn*, they daunder 'perplext wi' leisure,' clad in dark-blue jerseys and in high-heeled deck-boots, their arms up to the elbows in trouser-pockets, pipes alit, sauntering heavily, out of their element, from one silent cluster to another at the frowsy street-corners. The stranger (whose chief concern with the elements as likely as not may be never to go out without an umbrella), finds their sluggish movements ashore an easy target for jests, good-natured if cheap. But afloat, their life's business, the call of the sea, claims them; with good or bad markets, fair weather or foul, they are ready as greyhounds in the slips, good seamen, at home in the boats, masters of their calling. The few cowards or shirkers are soon ruthlessly labelled by them in the lifelong duel

* *All Rights Reserved.*

with the North Sea, where the glibly quoted, oft misunderstood law of the survival of the fittest works its hard, kind will. Wherefore the bronzed fishermen of the North-East, well-nigh useless ashore, are when afloat of the breed of men, grave, resourceful, steady-eyed, as those whose sailing-orders often lead them to look without falter on the gray face of the Enemy.

Generations of them have come and gone, following the same hard calling. Though set in this curious semi-detachment from the outer world, their brown sails and venturing prows range afar, buffeted and drenched by beating gales and spray from the Moray Firth to Yarmouth, to the sounding Hebrides and the rock-bound coast of Ireland. It may well be that their memories of wet decks and pitiless seas, of bitter north-easters, of the flood's moving accidents, have coloured their outlook, their speech, and their mental habit. Steam, co-operation, and the veneering of the School Boards have perhaps improved the lot of the younger men; but they come of a race whose traditions are of few joys, of hard weather, of the paying of toll to the gray Firth. Walk round their little kirkyard, within sound of the eternal surf and the wailing seabirds, and forget their colourless setting, for there you may often read the simple statement, doubtless written on many of their hearts, 'Drowned at Sea.' It is the 'killed in action' of their order.

From this cramped, capable race sprang Captain Hugh Flett, master of the steamship *Covesea*, of Findburgh, five hundred and fifty-two tons register. Many thought of his dour-looking port of registry as a blemish on the gracious seaboard, but to Captain Hugh it was the City of Dreams. He loved its dull streets, loved its 'snell' winds; tolerated its ancient and fish-like smells; smiled at its savage village gossip. To him the strong voice of the North Sea on the shingle was the very music of the spheres, for the place was Home.

Flett was a generous fathom of humanity, with big, pleasant Scots features and high cheek-bones. The seas and winds of his career as boy, man, mate, and master had given him a complexion as of the red granite of the North-East. His was a rare instance of one sprung from a fishing community successfully deserting the family calling. The names of men great in the State, scholars, soldiers, thinkers, born of Scots peasants, leap to the mind; but few from the fisherfolk, for they and their sons go straight from school to the boats, and from that day until the long Last Voyage their hands bear the marks of the bondage of the nets. Travel and training had whittled down some of the skipper's transmitted tendencies; but he was narrow, ignorant (if you like), in his parochial view of higher things; hospitable and suspicious; charitable to his neighbours; with the itch of his kind for preaching; careful in money matters; sensitive, vain, as many of his race on the North-East seaboard are, fiercely independent, and a scrupulously honest steward for his masters.

Moreover, was he not an elder? If a Sunday came round on one of his runs home you might see him on duty (did you chance that way), demure at the kirk-plate, clean-shaven, with shining morning face, solemn and vastly uncomfortable in Sunday 'blacks,' 'dicky,' and decorous necktie.

As good a sailor as ever weathered the rebellious seas of his homeland, Hugh was a favourite along the coast. The fisher-crews in 'jumpers' and big sea-boots welcomed him home from his voyages, and he had always a cheering word and the time o' day for them or their clattering, ungainly wives. 'A credit to the place,' was their verdict on Hugh Flett, with his fine sailor's record, his big, well-set-up figure, and good-natured eyes. Children and dogs sought his company.

It was a June evening, and the skipper was taking a quarterdeck walk up and down, up and down, in his cottage garden on the brow of the hill. The little plot of ground was starred with friendly common flowers, those beloved by the Little Poor Man of Assisi—pinks, marigolds, Canterbury-bells, pansies, Madonna lilies, and the like, that have a gracious habit of looking after themselves and raising their loyal heads in poor folk's gardens. He glowered seaward across the Firth, over the smoke of the little town, at the sun just beginning to dip behind the blue hills of Sutherland, and puffed meditatively at a cigar, a ripple of wrinkles on his tanned forehead. He was due to sail in the morning; hence his ghost of a frown. A minute or so passed. The comforting odour of the cooking of yellow haddocks rose on the evening air. The incense stole over him. He rose and went into his cottage, where his supper awaited him.

There was a nautical note in the room, struck by various atrocities in shell-ornaments, paintings of ships all under crowded sail, and a model or two under glass cases; visible also a photograph, consisting largely of whiskers and white bands, of the Reverend Gavin Sneckdraw of Findburgh (M.A., author of *My Fortnight in Switzerland* and *Some Aspects of Scottish Episcopacy*); and a picture of Saint Paul. The shepherd on earth had the place of honour, hung as it were on the line, above the chimney-piece; the saint was 'skied,' beside the exotic and somewhat dishevelled glory of a stuffed cockatoo.

The skipper made excellent trencher-play, silently. 'Jean,' said he to his wife, pausing half-way through his meal, 'I'm fair scunnered wi' headwin's, an' fogs, an' sic-like. I've been thinkin' I wish I could get a harbour-master's canny berth ashore. Ay, I wish to the Lord I could!'

'Wheesht, Hughie!' said Jean; 'ye needna be aye bringin' in the Lord's name. Never a word comes oot o' the heid o' ye but maun ha'e some blasphemin' or sweerin', an' you in the eldership.'

This was unfair on the good woman's part, for her man's language was anæmic compared with the vivid speech of the British merchant service; but it was her one little indulgence in nagging, and she revelled in it. Hugh, like the 'decent man' that the folk called him, never gave her a chance in

other directions, for he was saving, sober, and loyal.

'Weel, Jean,' he said, 'I'm no' sayin' but what ye may be richt. There's no' mony shipmasters elders. I ken twa or three deacons'—he waved a brown hand vaguely, as if indicating obscure sects of fire or devil worshippers—'but of coorse they're no' on the chart. No.' He swallowed the last of his supper and lit another manilla in the same busy moment.

'I whiles think the minister gi'es ye a keek in the kirk when he reads oot aboot "they that go doon to the sea in ships, that do business in great waters"'——

'"These see His wonders in the deep." Ay, that's in the Hunder and Seeventh Psalm, Jean,' continued her spouse, the words losing no dignity, though given by him complacently and as one who knew his bearings; 'but I doot it's no' muckle "business" I can do for you or masel', my lass. Twa' poun' ten a week an' three days ashore now an' then! It's owre muckle siller for one man to ha'e the handlin' o',' grunted the skipper sarcastically. 'I wonder whether I'll spend my savin's in free libraries or organs for the kirks. I would ha' been better at the fishin', like my father afore me. Siller! Naethin' but expenses cut doon, an' freights doon! Accordin' to my owners, I think freights maun be like whales—for every meenit they're showin' their heids they'll be twa hours doon. Dagon't, they're aye doon!'

'Ye're near sweerin' again,' said his spouse with a warning eye over the glint of her knitting-needles.

'Maybe so would you, gin ye were a man, elder or no elder. There's Davie growin' up, an' Jean an' Wullie an' Angus, siller gey scarce, an''—— He strangled the sentence and stopped short. It was a shame, he thought, to say anything disheartening to Jean to-night. He was to sail in the morning, and would be away for a month. Jean was a good wife. He would keep his grumbles to himself. Yet, as he smoked in silence, the wings of his thoughts hovered uneasily over the question of ways and means of providing for his children, his wife, his old age. So many of his shipmates had sailed away and never come home. Sometimes he dreamed o' nights of the storm in the North Sea in Ninety-five; felt again the lash of the blizzard on his face, saw the unspoken *Te morituri salutamus* in his men's eyes when he and the mate brought the *Covesea* in after a forty-eight hours' fight in blinding snow. Ay, that was a near thing! Or there arose visions of masterful seas, wild skies; a dull crash splitting the gray silence of the fog, and he would lie awake, afraid. No fear of Death! That was not in the mettle of his pasture; but the more haunting, colder thought of leaving his wife and bairns unprovided for shook him. There was no getting away from it—money was scarce, save as he might, and the bairns were growing up. Jean and he had their dear ambitions and dreams for them. Davie was a clever lad! Aberdeen University for Davie, if it could be managed. Hugh's eyes fell on his own tanned, rough hands, and he mentally reviewed his hard, underfed, overworked apprenticeship to the sea in coasting-schooners, in undermanned, under-engined 'tide-makers,' with poor pay and hard tack, under bullying mates. He would give his sons a better chance than ever he had, so he would!

Jean cleared her throat and gave an almost imperceptible glance at her husband. 'Speakin' o' organs an' free leebraries,' she began tentatively, 'I see a millionaire has gi'en an awfu' lot o' siller to the colleges for free eddication. I—I was thinkin' maybe we micht get Davie's name put forrit'——

'Never!' Hugh's fist on the table made the dishes rattle. Peter, their solemn Aberdeen terrier, crept from below the table and made a dignified exit. 'Never, Jean Marget Flett, as lang as I can mak' a shillin'! My bairns maun win a way without sornin'! I'll pay for them masel'.'

Jean loved and understood, a by no means common achievement; but these two belonged to the very rich poor, who had mated their hearts' desires. She smothered a sigh, laying a gentle hand on her husband's, and the two sat in silence.

The quiet was broken by a light step on the walk, and a pleasant voice called, 'May I come in?'

'Surely, sir; surely!' answered the skipper, and rose to greet the new-comer, a tall, spare man of about thirty-five, with black hair, moustache, and beard slightly tinged with gray. A pair of blue spectacles gave him an indoors look subtly at variance with his sunburnt hands and face and his gait of easy muscularity. He had a fine forehead and a small but clean-cut and delicate jaw and chin. His voice was of the mellowest bass. A handsome man, except perhaps that his eyes were a trifle too near each other. Until three months before, he was a stranger to the place. He lived at the 'Spey Arms.' The gossips soon discovered or invented his history: that his name was Westwater; that he was an Englishman, but, despite this blemish, appeared to be unobtrusively contented; that he was a bachelor; that he paid his way scrupulously, even generously; and the landlord of the 'Spey Arms' certified him to be a 'rale gentleman,' meaning thereby that he was not one of those who audited his hotel-bills too closely. Uncommercialism is the first peculiarity discovered in us by our acquaintances. They soon cure the most of us of it. He was recovering from an illness which had left his eyes weak, and had come to the bracing North for a change of air and to indulge in his hobby of geology. Hence his long, long tramps with hammer and knapsack along the coast and on the hills. The tall geologist, although somewhat of a solitary, was unmistakably well-bred, well-mannered, and good-looking, and a suggestion of reserve perhaps added to his personality. The villagers spoke of him as 'Mr' Westwater even behind his back, an eloquent concession in a community where nearly everybody knew and

spoke of each other by their Christian or 'tee' names. The women liked him.

He shook hands with Flett and his wife, lit one of the skipper's cigars, and the two men strolled out into the garden.

'You sail to-morrow morning, captain?' he asked. 'My reason for asking, in few words, is this. I am picking up strength here, and, except for my eyes, am nearly as fit as ever I was; but I fancy that the cruise of a month or so would set me up. As you know, I am much interested in geology, and I think that a short voyage with you would be useful if my information as to where you are bound for tallies with yours. The long and the short of it is, that if you can take me with you I'll be infinitely obliged; for passage-money, name your own terms.'

'Oh,' laughed the skipper, 'we're tramps, an' dinna charge passage-money; but I'll tak' ye like a shot, sir, for friendship's sake, for ye're a good neebur. We gang up the Baltic, then on to the Gulf o' Bothnia. But I must telephone my owners, of course. However, there'll be no deeficulty. I've plenty o' room, an', truth to tell, I'll be glad o' your company, for of course ye'll be the only passenger. Wi' decent weather, the trip should please ye weel. I wadna swap June in Finland an' the Gulf o' Bothnia for'—the skipper dredged for a sufficiently startling parallel—'for a fortnicht at Strathpeffer!'

'Finland!' said the other, ignoring the dazzling analogy. 'Can you let me have a look at the chart?'

'I'm jist goin' aboard before I turn in. Come along, an' I'll show ye the coorse.'

The two men sauntered down through the drab streets to the harbour, towards the yellow funnel of the *Covesea*; and in the chart-room Flett pointed out the course up the fairway of the Baltic, and, away farther north, a multitude of dots in the Gulf of Bothnia.

'We sail licht from here, and load granite at one o' the wee quarries on a nameless island away north fra Uto, then back to London. I've never been there, an' I'm told it's gey kittle wark. We'll ha'e to tak' three different pilots through the channels an' the islands for a matter o' forty or fifty mile.'

'Uto,' said Westwater, and then, half to himself, 'Uto, Lohm, Weymo.' His finger was tracing the names out, and his left hand holding the chart trembled suddenly, making the paper crackle.

The captain saw it. 'Are ye weel enough, sir?' he asked gently, for he liked the tall Englishman.

'Thanks, Flett. A touch of my old fever,' said the other. 'I got a chill on the hill yesterday, I think. A little quinine will put me right.' He bent down over the chart. 'Yes. We ought to have a pleasant voyage, captain,' he said, and straightened himself as the chart rolled up.

Flett went off to the telephone at the Customs Office, and in a short time reappeared.

'It's a' richt. Ye'll ha'e to ship as purser, though, to save bother in passports an' maybe the Russian wrong side o' a jail.'

So the geologist 'signed on.' His wage as passenger-purser was the nominal one of a shilling a week. He paid four shillings a day for his board, and the owners took no risk of his life, health, or chattels. His mellow laugh rang out as they left the *Covesea*.

'You must call me "purser" now. Well, well! we ought to have an interesting voyage. If I've any luck in my geological trips it's as good as a fifty-pound note in your pocket, skipper, and welcome.'

'Good-luck to ye, then, Mr Purser. As for the geology, my mind's a blank on't. The only stones I ken aboot are cobbles an' granite blocks. But I reckon ye'll be an expert in stones?'

The amateur purser gave another musical laugh. 'That's it, skipper! That's it! You've hit the gold first time! An expert in stones. I couldn't describe myself better. An expert in stones.' He found something quaint in the description, and repeated the words softly and to himself, his eyes twinkling behind his glasses.

'Good-night, then,' said Flett, and the two men shook hands. 'Ye'll be ready aboard to-morrow forenoon at the flow o' the tide. Ye'll put up wi' plain fare, of course, an' whiles a modest glass o' grog. Bring your gun an' fishin'-rod, an' some eucalyptus-oil, in case the mosquitoes fancy ye.'

It was growing dark. Westwater went to his room at the 'Spey Arms,' lit a lamp, closed the shutters, and locked the door. He brought out a chart and some papers from a locked case, took off the blue spectacles with obvious relief, and studied the chart with dark eyes that showed neither weakness of sight nor weakness of resolve. Then he put the chart in an oilskin cover, and carefully burned the rest of the papers. He sat silently into the night, thinking, thinking. Once he fancied he heard a sound, listened intently, put the oilskin into his pocket, and tiptoed to the shuttered window, peering cautiously through a chink; but there was nothing stirring in the quiet streets except a gray gull or two, no sound but the rumour of the sea. A thin shaft of gray light through the shutters shamed the lamp. He put the light out and opened the shutters and the casement.

The sun was rising over the broad, gray waste of waters, slowly, gently, as a mother loath to waken a child. The pearl of the summer dawn flushed as the first few rose-petals touched the sea. Gulls began to pipe, circling and swooping round the roofs; early birds twittered tentatively; the far-off bugle-note of a cockcrow was answered by one challenge after another, until the air quivered with gay réveilles. Above, patches of corn-flower stole shyly into the widening sky, the faint pink haze on the sea gradually broadening into a clear, trenchant highway of changing opals. Out of the slowly melting shadows a virile ridge formed north of the awakening Firth; the clean-cut cone of Morven etched against the pale morning; the long crest of the mountains, slowly changing from agate to

blue, rose magically out of the sea from Caithness to the Sutors, the scarred sentries on guard at the outer gate of the Cromarty Firth. Morning banks of mist cleared. Eastward, the sky and the calm waters met and mingled on the horizon, where a ship hung painted on the pearl-gray canvas of the morning. Brown dots of half-a-dozen sails marked homeward-hurrying fishing-boats; beyond the Black Isle the broad shoulders of Highland bens; nearer, trim, bright havens, light and dark green patches, fields and woods, yellow sands; and on far hillsides here and there a gleam of white cottages, where peat-smoke would be rising from humble, happy roofs, and men setting thankfully about their day's work, active and hopeful.

The morning air stirred in a delicate caress. It touched and startled the light-sleeping skirmishers of waves, unfurling the sea's thousand bannerets, spurring brisk-moving legions to gallop shorewards, stirring softly the feathers of the bents near the foreshore; then tiptoed down the empty street, to rustle the lilacs near the casement, and lay a cool, elusive hand on the man's hot eyes and drawn face.

He watched in silence, without movement, around him an ineluctable glamour.

A lark sang, mounting above the flaming gorse.

Sleep at last called him. He bit off an oath, whispering to himself with a joyless smile, 'An expert in stones!' and slowly turned his back on the virginal eyes of the morning.

*(To be continued.)*

# QUEEN HORTENSE'S DIAMOND NECKLACE.

By R. A. Gatty.

THE battle of Waterloo was over, and the French were in full retreat. Napoleon lingered on the field with his still unbroken Old Guard. His brother, Prince Jerome, urged him to commit an act of desperation. 'Here, brother,' he exclaimed, 'all who bear the name of Bonaparte should fall!' Napoleon, who was on foot, instantly mounted his horse; but his generals and staff, though willing to perish themselves, would not listen to any proposal which involved his death, and finally an aide-de-camp, seizing his bridle, led him at a gallop from the field. Many times during the terrible night the Emperor, jaded and worn-out with fatigue, fell asleep on his horse, and had to be supported by the arms of his attendants riding at his side.

Meanwhile the Prussian army, which had not arrived on the battlefield till the victory was nearly complete, continued the pursuit, which the worn-out English troops were unable to sustain. A dreadful slaughter ensued, and the French, abandoning their guns and baggage, were cut down as they fled before the merciless troops of Blücher. All through the long night the slaughter continued, while the Emperor, closely followed by the enemy's cavalry, pressed his retreat, through Genappe, Charleroi, Philippeville, Laon, to Paris.

It cannot be said that Napoleon's conduct in the hour of his defeat and humiliation was anything but noble and dignified. He refused all suggestions of coercing the National Assembly and playing the part he did on the 18th of Brumaire. 'I did not return from Elba,' he said, 'to inundate Paris with blood. I do not wish to employ force. I came in the hope of combining our last resources. They have abandoned me with the same facility with which they received me back. But let them do for the country what they will not do for me. I doubt their intentions. Those who wish to deliver me up to-day say that it is to save France. To-morrow, by delivering up France, they will prove that it was to save themselves.' After this he sent his act of abdication to the Assembly.

There was something to be said in favour of a policy of further defence of Paris. Grouchy had arrived under the walls with his army of seventy thousand men practically intact, and the lower classes were clamouring to be led against the enemy. The members of the Assembly thought otherwise; and well knowing that any rally to arms would be impossible without Napoleon taking the command, they decided to remove him from the capital to Malmaison, under the close observation of General Beker, who had orders not to lose sight of his person.

It soon became evident that the Emperor was, in a sense, a prisoner in his own house; and his friends and relatives prepared for the one remaining chance of escape, which was a flight to the United States. To this, apparently, the Assembly offered no resistance; and acting upon the advice of that arch-conspirator Fouché, they allowed Napoleon's preparations secretly to go on, and General Beker was ordered to accompany him to the port of Rochefort, where he hoped to embark. Meanwhile Fouché had informed the Allies of what was taking place, and British ships were sent to guard the French coast and render the Emperor's escape impossible. 'The Provisional Government,' says Sir Walter Scott in his Life of Napoleon, 'like skilful anglers, had been gradually drawing their nets around Napoleon, and it was now time, they thought, to drag him upon the shallows.' Whatever hopes had been raised in the breast of the unhappy Emperor were destined to be shattered on his arrival at the coast. Escape was utterly hopeless in the presence of the English ships of war.

Owing to Napoleon's hurried departure, very few preparations had been made for his requirements when in exile. The total sum of money obtainable was only about five or six thousand pounds, but a

large amount of valuable silver plate was collected and put amongst his baggage. Queen Hortense showed her affection by presenting him with a diamond necklace valued at two hundred thousand francs, and this Napoleon placed in a leathern girdle worn under his waistcoat. It was a treasure which might prove very serviceable in the coming time of trouble, and would be easily convertible into money should the occasion arise.

The surrender of Napoleon to Captain Maitland, and his removal with his suite on board the *Bellerophon*, need not be recapitulated; but the story of the necklace is not generally known. It cannot be said that the English Government behaved handsomely to the imperial captive who had placed himself unreservedly in their hands. Petty slights, and almost cruelty, seemed to govern the policy of the English authorities. Sir George Cockburn, the Admiral to whom Napoleon was consigned, received orders to seize the baggage, wines, provisions, plate, money, diamonds, bills of exchange, and saleable effects of all kinds belonging to the Emperor, and, with the exception of the plate, to retain them in support of the prisoner and his attendants. A proviso was added that should the Emperor die before the whole of his property happened to be consumed, he would be permitted to dispose of the surplus by will. Accordingly, assisted by a Custom House officer, the Admiral searched the effects of Napoleon and his suite, and seized four thousand napoleons in gold, leaving with Marchand, the Emperor's *valet de chambre*, who alone of all engaged in the imperial service consented to be present at this humiliating scene, fifteen hundred napoleons for his master's present use. The weapons of all Napoleon's attendants were next taken from them, the British Admiralty's order being that 'arms of every description should be taken from the French of whatever rank on board His Britannic Majesty's ships.' To Lord Keith's credit, it must be stated that he ordered the sword of the Emperor to be respected. Afterwards, when his secretary reminded him that this was contrary to the orders from headquarters, he desired that functionary to mind his own business.

It is, of course, quite impossible to know what Napoleon felt under this degrading treatment. He knew that his private effects had been ransacked and appropriated, and that his suite had been deprived of their swords, and no doubt he anticipated similar treatment for himself. There was upon his person Hortense's necklace, a rich prize if captured by the English Admiral; and it may have been in his mind to avoid this danger by transferring the necklace into the keeping of one of his suite who had already been under examination, and therefore not likely to be further molested. Anyhow, Count Las Cases states that, 'while walking with the Emperor in the stern galley, he drew from under his waistcoat, still conversing on a totally different subject, a species of girdle, which he handed to me, saying, "Take care of this for me." Without interrupting him, I placed it under my own waistcoat. The Emperor soon afterwards told me that it contained a diamond necklace worth two hundred thousand francs, which Queen Hortense had forced him to accept on his leaving Malmaison.' Nothing further passed at the time regarding the necklace, and the weary voyage was pursued to St Helena.

Count Las Cases states that on several occasions afterwards, at Longwood, he reminded the Emperor of the great charge he carried about on his person; but he received no reply. At length one day he reminded him again, and Napoleon said dryly, 'Does it annoy you?' 'No, sire,' was Las Cases' answer. 'Then keep it,' replied the Emperor. The necklace thus became part of Las Cases' personal attire, and he never laid it aside. Habit reconciled him to wearing it, and, as it eventually turned out, made him forget it altogether.

No one can read the story of Napoleon's imprisonment at St Helena without a feeling of disgust at the coarse and tyrannical behaviour of the Governor, Sir Hudson Lowe. Restrictions quite unnecessary were not only placed upon the Emperor's movements round Longwood, but even the necessaries of life were cut down to such an extent that the Emperor was forced to sell portions of his silver plate from time to time to procure what he required for his own table. It might be supposed that the silver plate with the imperial arms upon it would have fetched a large sum of money if it had been sold entire, but this Napoleon would not allow. Every piece was broken up and the silver sold by weight. As an instance of these transactions, the following appears in the diary of Dr O'Meara, Napoleon's medical attendant, under the date December 29, 1816: 'About five hundred pounds' worth of plate brought down by Cipriani in the morning to be sold. When Sir Hudson Lowe saw it he sent for Cipriani, from whom he demanded in what manner they could spend so much money. Cipriani, an arch and intelligent Corsican, replied, "To buy food." His Excellency affected surprise, and said, "What! have you not enough?" "We have purchased," said Cipriani, "so many fowls, so much butter, bread, meat, and divers other articles of food daily for some months; and I have to thank your *chef d'état major*, Colonel Reade, for his goodness in not only procuring me many things that I wanted, but for his kindness in seeing that the people did not impose upon me when I was paying for them." Sir Hudson was a little disconcerted at this reply at first, but afterwards resuming an appearance of astonishment, asked, "Why do you buy so much butter or so many fowls?" "Because," replied Cipriani, "the allowance granted by your Excellency does not give us enough to eat. You have taken off nearly half what the Admiral allowed us." Cipriani then gave him an account in detail of their wants, explaining the difference between the French and English mode of living, and accounted satisfactorily for everything.'

The strained relations between the Governor and the Emperor and his suite led to unfortunate results. Count Las Cases was made the victim of Sir Hudson Lowe's spite; and advantage was taken of a letter of complaint written by the Count, and he and his son were arrested and taken away from Longwood without a final interview with Napoleon. The Governor determined to send Las Cases out of the island and banish him to the Cape of Good Hope, and from the moment of his arrest all intercourse with the Emperor and Longwood was forbidden. This was a very serious blow to the Count and Napoleon, who greatly valued Las Cases' attendance upon himself. In the stress and worry of the moment the diamond necklace was completely forgotten, and Las Cases found himself in prison with this precious relic on his person and debarred from restoring it to the Emperor. He thus describes his own feelings: 'From wearing the girdle so long the necklace became, as it were, identified with my person; and I thought so little about it that it was not till some days after my being torn from Longwood, and by the merest accident, it recurred to my memory, when I shuddered at the idea of depriving the Emperor of such a resource. For how would it now be possible to make restitution? I was in the most rigorous confinement, surrounded by jailers and sentinels, so that all communication was impracticable. I vainly endeavoured to contrive a plan. Time pressed, and only a few days were left, and nothing could be more distressing than thus to quit the island. In this predicament I resolved to run all risks. An Englishman to whom I had often spoken came to the prison on a particular errand; and it was under the eyes of the Governor himself, and one of his most confidential agents whom he brought with him, that I ventured to communicate my wishes to the Englishman. "I think you are a man of principle," said I, "and I am going to put it to the test, though with nothing injurious or contrary to your honour—merely a rich deposit to be restored to Napoleon. If you accept the charge, my son will put it into your pocket." He answered only by slackening his pace. My son, whom I had prepared for the scene, followed him, and the necklace was transferred into this man's possession almost in sight of the military attendants. Before quitting the island I had the inexpressible satisfaction of knowing that the necklace had reached the hands of the Emperor. How gratifying to the heart are the recollection and recital of such a trait on the part of an enemy, and under such circumstances!'

## AN HOUR IN THE MUSEUM OF THE RECORD OFFICE.

A NARROW, irregular street turns out of Holborn, and runs towards the Strand and Fleet Street, and from the other end, of course, conducts wayfarers from those busy scenes to that great central highway. This crossway street is well known as Chancery Lane; but only a few of the hundreds of thousands of individuals forming the quick streams of life always flowing along the metropolitan thoroughfares mentioned are aware that about midway in it stands the comparatively new Record Office, and that within its spacious precincts is a museum open to the public for five afternoons every week, in which are deposited writings of supreme historical interest. These writings, all fraught with the fragrance of old times, as well as shaded with their tragedies, include such well-known items as Domesday Book, or Books (for there are two volumes); the letter sent to Lord Monteagle warning him not to attend Parliament, in consequence of a terrible blow that was about to be dealt to the wicked; two declarations signed by Guy Fawkes (Guido Faukes), and the sixteen questions drawn up by King James's own hand for the guidance of those appointed to examine the conspirator. It is satisfactory to see that the royal instructions recommended the use of the gentler tortures first before proceeding to those of more severity, and distressing to feel that the difference in the signatures to the two documents can only be accounted for by the conclusion that the later faint and feeble one must have been written after the application of the rack.

Domesday Book occupies a central place in this museum. The glass case in which it is placed is divided into three compartments, one of which contains the folio volume, the next portions of former bindings, and the third the quarto relating to Essex, Norfolk, and Suffolk. Both volumes are open, and we note that the scribes indicated a fresh subject by drawing a red line through the first few words of it. There are many charters of the early kings, and other documents ranging from a writ of William II. to the Coronation Roll of Queen Victoria.

Among those touching the confines of the literary world, Chaucer is represented in a bill sent in, when he was Clerk of the King's Works, for the issue of a commission to Hugh Swayn to purvey stones, timber, tiles, and shingles, &c., and to take masons, carpenters, and other workmen to Westminster, Sheen, and other places. Shakespeare is mentioned in a warrant from King James to Lord Cecil for the issue of letters-patent authorising the king's servants Lawrence Fletcher, William Shakespeare, Richard Burbige, and six others, to play for the recreation of the king's loving subjects, and for his own solace and pleasure when he should think good to see them. The poet Spenser informed commissioners in May 1589 that four thousand acres of attainted lands (formerly belonging to the Earl of Desmond) were allotted to him, but the necessary

patent had not been passed, and at least one thousand acres were wanting, and only six households of English people were upon his land when he wrote, but others had promised to come over as soon as his patent was passed. Ben Jonson's signature occurs at the close of a letter he sent to the Earl of Salisbury informing him of an interview with the chaplain of the Venetian ambassador concerning some business with which he was entrusted. There is a letter from Sir Walter Raleigh to Queen Anne, wife of James I., declaring that he never sought employment in Guinea, but only desired to do the king such service as had seldom been performed for any king, and complaining that after eight years' imprisonment he was as 'strayghtly lockt up' as on the first day. A letter from Francis Bacon, Viscount St Albans, written after his fall, piteously asks the king for a cell to which he may retire, the cell in question being a provostship.

One from Milton to Bradshaw introduces Andrew Marvell as a scholar of singular desert open to employment. Mr Marvile, he wrote, had spent four years in Holland, France, Italy, and Spain, and gained the languages of those countries, and was, no doubt, of an approved conversation, for he had been entrusted with the instruction of the daughter of Lord Fairfax; and if it should be seen he required an assistant (in consequence of his failing sight), he thinks it would be hard to find a man so fit every way for that purpose as this gentleman. John Strype the antiquary is also in evidence, making a request to George Holmes, then lodging at a sword-cutler's in Fleet Street, to consult the Liberate Roll, 25 Henry III., for an entry concerning the Great Tower; and the Patent Roll, 16 Henry VI., for information concerning the keeper of the lions. The great undertaking of the printing of the Bible is touched on in a letter from Miles Coverdale and Rychard Grafton, grocer, to Thomas Lord Cromwell, that accompanied two samples of it, one on parchment and the other on paper. There are letters, too, from Defoe (he prays the queen's mercy, and, in preference to penalties, offers to raise a troop of horse at his own expense); Mathew Prior, giving information, among other facts, of the whipping of a maid-servant in public for having conveyed letters to prisoners; Sir Richard Steele (he recommends John Rollos, engraver, as having a very pretty thought for the more commodious dress of women); and Addison, concerning an agitation among the clergy in Ireland. There is a memorial from Sir Isaac Newton relating to medals for the coronation of Queen Anne; and there is a letter from Sir William Dugdale recommending the bearer of it as a transcriber of records, 8th March 1668. Inigo Jones figures in this goodly company in a reminder to Sir Dudley Carleton that there was 'a great summe yet behind to the workmen,' involving delay in the removal of a nuisance before Scotland Gate. A similar difficulty concerning building expenses is shown in a memorial from Sir Christopher Wren praying for allowances for works at Hampton Court, Kensington, and elsewhere, signed 'Chr. Wren.' Some well-known artists also are brought vividly before us. Peter Paul Rubens writes to Sir Dudley Carleton, ambassador at the Hague, offering to exchange a selection of pictures, mostly by his own hand, for a collection of antiques; Vandyck requests Balthasar Gerbier to suspend negotiations touching a proposed journey to England in 1632; and Sir Peter Lely certifies he believes George Freeman to be the best and fittest person in England to be employed in making designs for tapestry, prints, or any other inventions belonging to a history-painter.

But these are as naught compared with the appealing interest of such royal personages as Jane the Quene (as it was permitted Lady Jane Grey to subscribe herself), Mary Queen of Scots, Queen Mary (or Marye the Quene, as she signed herself with or without 'Phillipus'), Anne Boleyn, and Queen Elizabeth and her courtiers. It happened that the signature of the unhappy queen of nine days related to the appointment of Edward Bernarde as Sheriff of Wiltshire, while it was reserved for Marye the Quene to issue the necessary letters-patent for it. Anne Boleyn sent cramp-rings to her correspondent Master Stephen Gardiner. These were blessed by King Harry, and supposed to exempt wearers from epilepsy. The Queen of Scots wrote to Sir William Cecil in Scottish-English to express her desire to conciliate 'the quin her good sister,' and signed herself 'Yowr Richt asured good frind, Marie R.' John Knox, however, wrote to the same official that if he did not strike at the root, the branches that appear broken would bud again—which probably helped to neutralise her efforts to establish a good understanding. Queen Elizabeth's signature occurs to a warrant for the delivery of twelve prisoners, who had incurred or were likely to receive the penalty of death, to Martin Frobisher, to the end that they should make a voyage with him or 'a viage by the seas' to discover new countries. This was in 1577. The Earl of Leicester, six days before he died, sent his royal mistress a letter to inquire after her health, assuring her the chief thing he prayed for was her good health and long life. He said he continued her medicine, and concluded: 'I humbly kyss your foote.' The Earl of Essex wrote more fancifully twelve years afterwards: He told his paper to haste to the queen's presence and kiss her fair correcting hand that laid new plasters to his lighter hurt, but to his great wound applied nothing; and added the paper was to say it came from 'shaming, languishing, despayring SX.' There is a letter in French from Catharine de' Medici to Elizabeth, signed as her '*bonne seur et cousine Caterine.*'

It is difficult to turn from the charm of the older writings and the spells they conjure up, though there are many attractions in view, such as a prayer in the handwriting of Charles I. that is in the *Eikon Basilike*, which seems to confirm his claim to the authorship of that work; and an array

of names as brilliant as Sir Philip Sidney's, Sir Francis Drake's, or that of John Duke of Marlborough. We see letters, petitions, and seals bearing upon the history of America. One document is a round-robin signed by certain Walloons and Frenchmen who promise to go and inhabit Virginia, then under the sway of the king of Great Britain; another is a petition, dated August 1685, from William Penn, praying that the difference between Lord Baltimore and himself may be soon heard by the Lords of Plantations; another is a petition to King George III., signed by John Hancock, John Adams, Benjamin Franklin, and forty-six others, regretting the late war, and desiring a restoration of the former harmony between Great Britain and her colonies; and there is also a letter from George Washington to his great and good friend George III. concerning ratifications of a treaty of amity, including matters of commerce and navigation, besides a map of Hudson's and Rareton River surveyed in the year 1700 by W. W. Romer. Sidelights upon still more recent transactions are given in letters from Nelson, Bonaparte (First Consul), Wellington, and a joint communication from the Emperor of Russia and the Emperor of the French to George III., signed 'Alexandre' and 'Napoleon.' The log of the proceedings on board His Majesty's ship *Victory* is here preserved. Thomas M. Hardy, captain, set down particulars of the battle of Trafalgar, when Nelson, having been wounded in the shoulder about 1.15 P.M., a victory was reported to him at 4.30 P.M., and 'he then died of his wound.' Two letters from Nelson are signed with his left hand, and one is here preserved that is among the last he wrote before the loss of his right arm.

The museum occupies the site of the ancient Chapel of the Rolls; and in it are retained a few of the old sepulchral monuments, notably those of Richard Allington (dated 1561), Edward, Lord Bruce of Kinloss, Master of the Rolls (1611), and Dr John Yong (1516), the effigy on which is attributed to the sculptor of the figures on the tomb of Henry VII. in Westminster Abbey. Besides the numerous documents alluded to, and many of a similar nature, there are arranged in it some other items, such as half-a-dozen old chests (some of which long lay hid, so to say, in the Chapel of the Pyx), several coffers, a hanaper or two containing deeds, wooden skippets dating from the fourteenth century, keys, tallies, and pouches for records, dies, and seals; some pottery, found in course of the rebuilding in 1895; and a pair of doors for a large press, inscribed with the information that it was intended for the keeping of all pelles of receipts, warrants, and writings in the reign of Philip and Mary. Not the least interesting item among these more miscellaneous relics is a roll showing the marks on the bills of swans by which their owners could recognise them, between the years 1497 and 1515. The monks of Croyland, Thorny, Ramsay, and Revesby, several parsons, 'my Ladie's grace the Kynges moder,' are mentioned in this list of swan-owners.

All the varied and valuable contents have been carefully, copiously, and learnedly catalogued by Sir H. C. Maxwell Lyte, Deputy-Keeper of the Rolls, for the guidance of visitors. As we pass out into Chancery Lane we seem to emerge from an atmosphere laden with the thoughts and aims of great personages for a time extending over nine centuries; we seem, too, to have been amidst surroundings and suggestions of valour, courtesy, and endeavour not to be held lightly. Many of the early royal writings are in French, and many in Latin; and great seals are appended to them placed in bags of quilted damask, or striped silk, or white linen, or dark worsted. The seal attached to a confirmation by Thomas 'Beket' is in a bag of gold brocade. A treaty between Edward I. and Guy, Count of Flanders, has four seals; a document signed by the claimants to the Scottish throne promising to abide by the decision of Edward has their eight seals appended by cords of red and green silk. Some seals of the time of Henry VII. are in silver cases. Some Oriental paper as early as 1665 is of a reddish tinge flecked with silver, and some is powdered with flowers in gold. Pondering in this confused way over these writings and old phrasings that tell so much—the relief of some executions, the pity of others; the confiscations and restitutions, defeats and victories; the lament of the Sire de Coucy to King Richard II. that there should be war, and his request that another person should be appointed to the Order of the Garter in his stead, as he must renounce his fealty; the list of vestments bequeathed by Edward Prince of Wales to Canterbury; the 'illnesse of the ways and height of the waters' that delayed Pepys on his journey to Norwich—we draw near to Fleet Street, and these lingering and crowding thoughts are lost in the traffic of to-day.

## A LITANY OF REMEMBRANCE.

There's rosemary—that's for remembrance.

When old age doth on us creep,
When for dear dead days we weep—
For remembrance, rosemary.
For all treasures that we keep—
For remembrance, rosemary.
When to light again upleap
Thoughts that we had laid to sleep,
Sweet past joys or sorrows deep—
For remembrance, rosemary.

For the joys of youth, rose-red;
For the happy hours long fled—
For remembrance, rosemary.
Of the words of love we said—
For remembrance, rosemary.
For the times our hearts have bled,
For the tears that we have shed,
And in memory of the dead—
For remembrance, rosemary.

# UNTRODDEN WAYS IN NIGERIA.

By CONSTANCE LARYMORE, Author of *A Resident's Wife in Nigeria.*

WE found our way there by long marching through dark, cool forest and smooth, slippery rock-land where foothold was all but impossible. In the open, too, the path was almost obliterated, and had diminished to an infinitesimal channel trickling with water; the grass, meeting over our heads, had to be battled with, making each mile the length of three; and thus we struggled along, striving to shield our eyes from the stinging, ripe grass-seeds, loose and sharp as needles.

It is called Ikarre. It lies fifty miles south of Kabba, which also is sixty miles from the Niger, and that (as some people know) is in its turn a long way from London; and as the last European visit there happened more than a year ago, it can fairly claim to be approaching the 'back of beyond.'

On arrival in the little, brown, dusty town we received a noisy and enthusiastic welcome, and were ceremoniously conducted to the 'royal' compound, there to be lodged as the Sariki's guests.

The compound itself is an unusual sight. In the centre is a square courtyard about the extent of an acre, with deep verandas running all round under immensely deep roofs thatched with the broad leaves of the plantain. Opposite the entrance are the Sariki's dwellings. The veranda is loftier and wider than the rest, the clay walls smoothly faced with a pale-gray native cement and roughly but effectively decorated with mouldings of the clay. In the centre is a doorway, and a wide couch of the same gray clay, spread with brightly coloured mats, cloths, and huge scarlet cushions. Here his Majesty reclines during the afternoon and evening for social intercourse, small-talk, and professional story-telling. In the mornings he occupies a somewhat similar 'throne' at the main entrance to his apartments, and holds audiences, hears complaints, receives visitors, and generally transacts the business of the day.

Ikarre is the home of the wood-carving art of Northern Nigeria, and these verandas are upheld by weird, carved wooden figures of men, women, children, horses, alligators, and monkeys in fantastic shapes and attitudes, grotesque to a certain extent, but equally amazing; the wood, a kind of teak, being almost of the hardness of iron, and carving-tools an unknown luxury. My heart covets the carved doors in that compound, huge slabs of timber completely covered with carved figures of human beings and animals; but the plant-world seems to have no attraction for the artist.

Around the compound, behind the verandas, is a veritable rabbit-warren of dwellings occupied by the members of the household—low, dark doorways, full of peeping women and children, leading to a labyrinth of tiny courtyards one behind the other. Our lodging consists of one huge chamber, cool and dark as the crypt of a cathedral, and about as comfortable to live in. It is intended, one supposes, as a kind of courthouse or audience-chamber, as there is a wide seat running all round the sides, and in the centre a highly imposing but most inconvenient dais approached by three steps—an exceedingly ready trap for the unwary in the gray twilight, which is all that can penetrate there. The ceiling is formed of immense slabs of wood, absolutely black with age and a recent fire, which latter made no more impression on them than to darken their colour. Opposite the dais stands a carved column, the sides being merely dog-toothed, but the front bearing two boldly carved figures, the work so deep that they are attached to the column itself only here and there. The upper one is a seated figure playing (with an expression of ecstasy) on a reed instrument, and the lower (also seated) holds a shield. The facial expression given to these quaint creatures makes them almost life-like and a source of constant joy; but they utterly defeat my poor pencil, and a camera would be useless in the semi-darkness.

On the evening of our arrival we decided to celebrate the event by giving a ball, a suggestion received with huge delight. The guests were asked for half-past seven, and we arranged to dine earlier to accommodate them. But the good people of Ikarre reck little of time beyond sunrise and

[*All Rights Reserved.*]

sunset; wherefore, to our dismay, when we had scarcely commenced to change for dinner the crowd surged into the compound—men, women, and children—running, jostling, and squeaking from sheer pleasurable excitement. All the musicians of the town were drumming, rattling, and braying their loudest, and we had to communicate our feelings to each other and converse by signs while we dressed. A small space was cleared for our table, and we dined amid the deafening uproar—a spectacle of deepest interest to the hundreds of watchers, judging by the valiant struggles for front places. Dinner over, the dance began in earnest; a most remarkable sight, if 'sight' it could be called, for the fearful danger of firing the thatched roofs all round had forced us to forbid unprotected lights. The performance, accordingly, was illuminated only by a few feeble lanterns and flashes of brilliant blue lightning out of deep-black sky, the pink-shaded candles on our table merely serving to make the darkness darker where the ever-shifting crowd moved and swayed. Dancer after dancer (all men) sprang out of the throng, capered, shuffled, circled, and pranced, apparently entirely to his own satisfaction and that of the spectators. Suddenly, to our embarrassment and dismay, the Sariki, squatting at ease on his mat beside the Resident, jumped to his feet, and, addressing the performers in high-voiced indignation, rated them soundly for 'bad dancing and bad drumming,' and generally condemned in round terms the whole entertainment offered to us. We felt horribly uncomfortable when this was interpreted; but the admonition was effective in the extreme, the 'dancing' that followed being of quite a different kind, and in its way remarkably clever, though as far removed from dancing as any form of motion could be.

A man clothed in a long white robe, the wide sleeves of which covered his hands so that only his bare feet were visible, appeared at one end of the clear space. Without raising heels or toes from the ground, and with white-draped arms spread wide, he began to revolve slowly, with movements of the feet so imperceptible as to give the impression of a figure moved by wires, the rest of his limbs rigid and motionless. Quicker and quicker he revolved, making his way down the open space, till on reaching our chairs he twirled round and round so rapidly that he became a mere whirlwind of flying white cloth revolving on a pivot of apparently motionless black feet. Then he stumbled and fell, gasping and exhausted, into the crowd, which opened to receive him with loud and long plaudits; and the Sariki smiled, well pleased at our appreciation.

About nine o'clock we made the brilliant discovery that it was for us to give the signal for departure, and in less than ten minutes the courtyard was empty, silent, and dark. What a millennium for the weary London hostess if etiquette permitted her, after a couple of hours of her ball, to smile at her guests and say pleasantly, 'Thanks so much. You have danced beautifully; you can go now,' and see them depart in high good-humour and with no resentment!

The next day was given over mainly to matters judicial, and gave one curious glimpses of what these primitive folks feel to be very real grievances. The Resident spent some hours unravelling what appeared to be a serious trouble. A man had brought a complaint that the people of his native town, a village close to Ikarre, had forced him to fly owing to their threats to kill him. These people, being summoned, arrived in force, and entirely bore out his statement, vigorously repeating their firm determination to have his life, and all on account of his refusal to join them in cleaning a path and some further recalcitrant behaviour in the matter of a yam-farm.

Another case where public feeling ran very high was that of a truculent princess, a sister of the Sariki. She appeared to have tangled her matrimonial affairs pretty considerably, and stated her case with immense vigour, producing two 'husbands' of such unprepossessing appearance that I entirely sympathised with the Sariki's strong disapproval, her selection being a most repulsive-looking gray-beard with only one eye. But the lady displayed passionate affection for him, refused utterly to return to her lawful owner, and made excited rushes forward, threatening to cut her throat, with such wild gestures and hysterical shrieks that we both sorrowed that material so promising was lost to the ranks of the Suffragettes. When promises of settlement were made, she was induced to seat herself sulkily on a corner of her royal brother's mat in token of his protection. Very shortly her lawful owner (wisely, to my mind) resigned all claim to this female hooligan for the consideration of four pounds sterling, the price originally paid for her; and universal amiability was restored, except that the Sariki could by no means conceal his contempt for her new choice.

Night was made hideous by a party of merry-makers who, doubtless imagining we liked it, perambulated the town, drumming and singing, from compound to compound; and a little black cow, bereaved of her calf, took up her stand just outside the veranda and wailed her loss plaintively and ceaselessly. The next morning, therefore, we were relieved to find ourselves marching away out into the deep, cool kola-forests, where the precious trees are in their thousands, yielding the Sariki of Ikarre an annual income approaching four figures. He, wise man, not content with reaping the harvest of his grandfather's industry, diligently plants young trees in all directions beside the trickling streams and on the slopes of rich black soil.

We climbed up and up, with glimpses of a magnificent sea of forest-country, till we reached a tiny village which we call the Crystal Palace, for the clay of the houses is full of tiny bits of mica, and the little, thatched huts twinkle and glitter most gorgeously in the morning sun. Here, also, the one bread-fruit tree I have seen in Northern

Nigeria spreads broad shade in the market-place. Then downwards to our camping-place, where there are more curious carvings, also two most unfortunate alligators in captivity. These had been caught when quite young by the father of the present Sariki in a strange little pond in the forest, afterwards shown to us. We were told that this pond is swarming with alligators—a curious fact, as it must be quite fifty miles from the Niger, with no visible communication. Now that the old Sariki is dead, the wretched alligators have grown formidable, their wooden trough is broken, and no one apparently proposes to replace it. We found the captives in a small open space enclosed by a circular wall, gasping on the dry earth without shade or water. When we begged for their release or execution, grave heads were shaken. 'We cannot do anything at all with them; you see, they belonged to the old Sariki. We give them meat every day,' with conscious virtue. We had the alligators well drenched with water, and insisted on a new trough being provided without delay.

On the next day's road our faces were turned towards civilisation. The native traders, padding wearily along under monster loads of palm-oil, showed that the untrodden ways were left behind, and we were travelling to where the long arm of commercial enterprise has already reached.

---

# LAURISTONS.

### CHAPTER II.—HOW THE NAME OF LAURISTON STOOD HIGH.

T was only when they were trudging across Castle Bear Common and nearing the comfortable red-roofed house which nestled among the trees on the crest of the hill that Etienne asked of Charles the not unnatural question, 'Do you tell, *mon ami*, that we broke the bounds and ran after the soldiers?' For his grandfather's very last weighty word to him, as he was setting out with John Sax to visit the Lauristons in their country home, was, 'Your very best behaviour now, *mon garçon*, or you and I will have accounts to settle later on. Don't get into any mischief or lead the others into it. Remember, you are a Montessonne, and not among your own people. I shall question Mademoiselle Lauriston about you when I see her.' The old gentleman knew better than any one else, you see, the mingling of hot, loose strains that had gone to the making of Etienne, and the capriciousness of training that had done little to control their occasional outcroppings.

And to the French boy's anxious questioning, the English boy replied with British brusquerie, 'Of course! We broke bounds, and we own up. My, that horse was a beauty! But holsters are beastly uncomfortable things to sit on!' And a sudden twinge in his left leg set him to prompt examination of the mordant bite of the buckle.

'But why say anything to madame and mademoiselle?' persisted Etienne, in further effort to avert possible consequences.

'Pooh! we always own up.—Don't we, Jack?'

'M—yes. Nearly always,' said John Sax soberly.

'Quite always,' interjected Mavie, ''cept when it's such a little, teeny thing that it doesn't matter.'

'*Eh bien!* it was surely a very small affair that we ran across a field to see the soldiers—and such fine soldiers!' Oh diplomatic Etienne! 'Unless one were made of wood one could not help running to see them.'

'They're pretty sure to ask what we've been doing,' said Charles philosophically. 'Besides, we're all over mud, and those beastly dogs bit a hole in Mavie's arm.'

'*Mon dieu!* I did not know. The evil beasts! Is it bad?' and he looked anxiously at Mavie's unconcerned face.

'I didn't feel it till John Sax nearly sucked me to death. I believe he bit me, too,' said Mavie, feeling her arm tenderly.

'No, I didn't. I only sucked it to get the poison out,' said John Sax doggedly.

'We will get Mrs Hepsy to see to it, and then we could clean ourselves, and no one need know,' suggested Etienne.

'Oh, don't worry! They'll only scold at most, and that doesn't hurt,' said Charles in a tone of one who had suffered direr tribulations in his time.

'My grandfather, he will ask mademoiselle how I have behaved; and she will say, "Etienne was bad. He led the rest away." Then'——

'I'll say it was all my fault. I wanted to see the soldiers more than any of you. And, anyway, I was the only one that rode. That was a horse! When I go into the army I'll have a horse just like that, and a cap with a plume!' And he revelled again in the remembrance of it all.

Notwithstanding their determination against any attempt at evasion, there was no need to walk straight in on Aunt Charlotte, who was of a capricious humour at times, and might only laugh or might proceed to extremities, you could never tell which. So they made discreetly through the shrubberies for the stables, where there was the chance of a preliminary brush-down before venturing inside, purely out of consideration, of course, for the indwellers, who regarded mud as out of place in halls and rooms.

'Hech, sirs, but there's been het wark the day!' came a voice from the cheerful obscurity of the harness-room. 'Hoo mony o' the red deevils did ye mak' away wi' the day, General? They foucht sair hard, I can see. Have ye ony skelps?'

'No scalps at all, Jerry,' said Mavie.

'D'ye say? No skelps!' in sympathetic condolence with such poor luck.

'We want a bit of a brush before we go in, Jerry. We're a bit dirty.'

'My stars, ye are that! Come awa', then!' and reaching down a stiff brush, he set to work, turning her round and round with a professional hissing which gave quite a realistic touch to the proceedings.

'An' never a skelp for a' that dirt!' said he as the dust rose. 'An' ye tore yer frock,' he said sympathisingly. 'But ye're aye tearin' yer clothes, ye wee tatter-wallops.'

'It was a dog did that. They were after a fox, and it ran across the plank, and we threw it into the water.'

'The fox was it, or the dog?'

'The plank, you old silly!—to stop the dogs going after it. And one of them bit me.'

'Bit ye! Show me, then;' and he turned up the little sleeve quickly, and pinched his brows at sight of the big discoloration.

'It wasn't the dog did that,' said Mavie. 'It was John Sax's sucking made all that. It wasn't half as bad before.'

'Ye suckit it weel?' And John Sax nodded. 'Ye've got some rumgumption aboot ye, John Sax, like yer father had. Ye did weel. Hepsy'll wash it an' bind it up, an' it'll heal a' richt.—Why'd ye let her get bit? Was ony o' ye bit?' looking round at the boys.

'We didn't know she was bitten. She didn't know herself till John Sax found it out,' said Charles; and then, with gusto, 'And we saw some soldiers, Jerry; and one of them took me up on his horse in front of him. He was an officer'——

'Ay! in the meadows were they, noo?'

'No; in the road by the church. Such horses, Jerry'——

'Then ye bruk bounds again, ye young limmers!'

'Great big gray horses, Jerry,' continued Charles.

'Ay!' with sudden accession of interest.

'And the men had red coats and head-dresses with plumes.'

''Deed an' ye micht weel run efter them. 'Twould be the old regiment, I'm thinkin', or a bit o' it mebbe. How many was there, noo?'

'Oh, hundreds and hundreds!' cried Mavie, delighted at his diversion.

'Between one hundred and fifty and one hundred and sixty,' said John Sax in his matter-of-fact way.

'Ay, jist a squadron. Yer father's old regiment! He'd no' blame ye overmuch, I wis, though ye did break yer bounds. 'Twould be in yer blood, an' ye couldna help it.—Now, missy, ye're as clean as I can mak' ye, an' that's none too clean efter a'.—You laddies can clean ane anither. An' ye saw the old regiment? Weel, weel! An' where was they goin'?' And he sat down on a three-legged stool and began to fill his pipe.

'Over Harrow way. I asked the officer if they were going to the wars, and he said, "Yes, if the chance comes," and he promised to look out for me when I go into the army.'

'Aweel, there'll be time eneuch for him to get killed twa-three times afore then mebbe.'

'Oh Jerry, I do hope he won't get killed! He was such a nice man,' said Mavie plaintively.

'Ay, ay, it's jist them 'at gets killed first,' said Jerry musingly from the slow, blue curls of smoke. 'The guid aye die young, ye ken.'

'Oh Jerry! do they always? Must they? Why must they? It doesn't seem fair,' protested Mavie.

'Aweel, there's aye exceptions to a' rules, missy, so dinna fash yersel'. Ye'll live just as long as the Lord sees guid for ye. Luk at me!'

'I think you can't have been very good when you were young, Jerry, for you're a very, very old man now,' said Mavie, regarding him critically from this novel point of view.

'I was ane o' the exceptions, an' yer father was anither. But nigh eneuch we bin to it at times, both in America an' 'gainst the Frenchmen.—Yer father, noo,' he said, nodding gravely at John Sax, 'he was ane o' them that had to go, an' he went in place o' Master Charles. Ay, John Sax was a man, though they couldna mak' a bank-clerk oot o' him. If they had, it's widdys an' orphans we'd a' been here this day withoot a doot, an' but a puir kind o' clerk they'd have had at the bank.'

'And we're never going to forget it,' said Charles, laying his arm across John Sax's shoulder. 'Jack's coming into the army with me, and when we've had enough fighting he's coming into the bank with me. I wish to goodness Mavie'd been a boy!'

'And I wish to goodness I had!'

'Then she could have taken on the wretched old bank, and we could have been soldiers all our lives.'

'Aweel, there's mony a ane would be glad to tak' on Lauriston's Bank,' chuckled old Jerry; 'an' ye can get a' the soldiers ye want by payin' for 'em. But there must aye be a Lauriston in the bank, ye ken, or folks wouldna have the confidence in it. There's no better name than Lauriston in a' London City, an' there's no city in a' the world comes up to London, an' so ye may tak' it there's no better name than Lauriston in a' the world. 'Second to None" it is—same as the old regiment. I have seen men go doon, an' I have seen banks go doon, but I havena met the man yet that had an ill word to say against the name o' Lauriston. An' when I do meet him he'll be wishin' he hadna been born, or that he'd been born so unco guid that he'd died in his airly youth.'

'Jerry, you're an old dear,' said Mavie, 'and I take back what I said. You're one of the 'ceptions to the rule too, like father and John Sax's father.'

'Aweel—mebbe!' chuckled the old man. 'An' so I said. But noo, my doo, you'd better run in an' preen the rest o' yer feathers, an' get Hepsy to see to that airm before yer awnt sees ye, or she'll mebbe have somethin' to say. There's some o' that dirt won't come off yet awhile. Better ask Hepsy to pit it afore the fire to dry. Fegs! ye're catched red-

handed noo!' and Jerry smothered his pipe with a gouge of his little finger, and lost himself in the quite unnecessary polishing of the silver boss of a headpiece.

Hasty steps came over the cobbles, and a sharp voice cried, 'Jere'——

'Miah MacClootie,' squeaked Jerry in so close an imitation of the speaker that the children broke into a shout of laughter. 'I thocht it was yer awnt,' he said, with a warning wink that prepared them for the approaching conflict with the new-comer.

'An' what will Mistress Jezebel Honeybone be wantin' wi' Mr Jeremiah MacClootie?' he asked with a vinegary suavity which sufficiently expressed his feelings.

If there was one thing old Jerry detested more than all others, it was the name bestowed upon the deserted scrap of humanity, sixty-odd years before, by the Lowland farmer into whose haystack, and upon whose care, his tinker parents had lightly cast their responsibilities and passed on their way. 'Jeremiah he shall be, because his life is like to be not free from lamentation,' said the pawky owner of the haystack. 'An' MacClootie he is withoot a doot, for it's a wunner the draigglin' deevils didna set the stacks ableeze.'

And Jeremiah, son of the Evil One, he had been all his life, and all his life had set himself strenuously to prove that though you may give a dog an ill name in his youth it may not be absolutely necessary to hang him, since he did not choose it himself and may not deserve it. By long and faithful service he had worked out the venom from his undeserved patronymic. To every one in the household he was 'Jerry'—both in name and nature—with the one exception of Mistress Isabella Honeybun, Miss Lauriston's maid.

Miss Honeybun was a young person of some five-and-fifty autumns and winters, with whose sharp nose and tight mouth and frosty aspect it was difficult to associate any ideas of springs or summers, or any of the little amenities of life whatsoever. According to her somewhat dim and distorted lights she served her mistress faithfully, and kept her very fully informed of the sayings and doings of all about her, whereby Miss Lauriston acquired much curious information and Miss Honeybun an ill reputation as tale-bearer and trouble-maker.

Unkind gossips said that Miss Honeybun had at one time set her severely prim cap at Mr Jerry, and would have been quite willing to overlook even the disability of his unfortunate name. But Jerry's stout old heart had gone elsewhere. He turned a cold face to Miss Honeybun, and married Hephzibah Mowatt, a very different kind of person. It was an undoubted fact that after a certain time in her life Miss Honeybun's lips tightened, the frosty sharpness of her nose grew more pronounced, and she never addressed Jerry save as Jeremiah MacClootie, with a very full and scornful accent on both penultimates, and he retorted always with Mistress Jezebel, or Mistress Honeybone, to which latter piece of irony the maiden's bodily angularities lent peculiarly toothsome flavour. In a word, they were both devoted servants of their own sides of the house, and detested one another most cordially.

'An' what will Mistress Jezebel Honeybone be wantin' wi' Mr Jeremiah MacClootie?'

'You're to have the carriage ready for my mistress at four o'clock. We go to town for the master's grand dinner, and return to-morrow. You've been smoking, I see.'

'Ah, ha! the eyes o' um, an' the nose o' um!' growled Jerry, with a look of appreciation at that disdainfully sniffing organ. Then he coolly produced his pipe and flint-and-steel, and proceeded to light up again.

'You'll set the place on fire some day with your dirty tobacco-smoking.'

'Ye'll smell it in guid time, my dear, an' be able to tell some ane a' aboot it.'

'And you children, wherever have you been? You're mud from head to feet! Come into the house at once and get cleaned up. You know your mamma does not like your playing about the stables and learning evil habits—smoking, and the like.'

'Mother says Jerry's a treasure,' said Mavie boldly. 'And he's a dear old thing, and he hasn't got any evil habits.'

'There's for ye, Mistress Jezebel,' grinned Jerry.

'Come in at once, I say, and get cleaned up.'

'Let go my arm, Honeybun, or I'll—I'll bite you,' cried the struggling Mavie. 'Your fingers are like the pinchers the Red Indians tear off their prisoners' flesh with.'

'Haw, haw, haw!' laughed Jerry in huge delight.

'Such-like things to teach the poor innocents!' scathed Honeybun, who knew whence the children got all their Indian lore. 'You'll please to remember—four o'clock!' as she turned to go.

'I'll be ready, an' I'll no' forget my pishtols this time. Ye'd better carry a blunderbush yersel', Mistress Jezebel. Then if'——

'Why, are the footpads out again?' asked Miss Honeybun, turning with a startled face and releasing Mavie's arm.

'Oh ay, they're oot richt eneuch. The Windsor coach was stopped last nicht, an' a' the passengers cleaned oot to their last bodle. But ye jist gi'e them ae glint o' yer nose, Mistress Jezebel, an' we'se be a' richt. Jist keek oot the window an' gi'e them a broadside o' yer very worst language, an' they'll turn an' awa' for a' they're worth.'

Miss Honeybun turned and went into the house with knitted brows, undecided whether to impart this particular piece of information to her mistress or not. Her dread of footpads and highwaymen was fully equal to her mistress's. On the other hand, Grosvenor Place and the gaieties of town appealed to her very much more than did the more serene pleasures of the country-side. She was still pondering the matter when the children slipped past her, in Indian file of course, in search of Hepsy MacClootie.

*(To be continued.)*

# VAGARIES OF A FLUCTUATING CURRENCY.

WHEN the large amount of British capital invested in South America—estimated, at least, at two hundred million pounds for Argentina and Brazil alone—is taken into account, it is not to be wondered at that the British investor should feel interested in the financial policy of the various South American Governments. A bulky and instructive volume could be written on this subject; in an article like the present, however, it is impossible to do more than mention a few of the more salient points of South American finance.

In many respects South America is a country pre-eminently favoured by nature. Nearly half of the continent may be said to possess a temperate and healthy climate, a still greater part is blessed with a fertile soil, while thousands of miles of navigable waterways afford access to the very heart of the continent in several directions. It is true they have revolutions; but in the writer's experience an ordinary South American revolution is productive of less loss and inconvenience than the great strikes now so prevalent in England and her colonies. Strikes on a large scale are comparatively scarce in South America; there is no socialistic or anti-capitalist legislation to speak of; of trades-union influence there is little; and the labour vote—so powerful in some Anglo-Saxon countries, notably Australia—is here an insignificant factor in political life. No wonder, therefore, that many an English capitalist, disappointed at the results of his investments in other parts of the world, turns with a hopeful eye to South America, for here the relations between capital and labour are in many respects less strained.

But South America has its drawbacks. There are few of the Latin-American countries which can be said to enjoy the blessing of good government, no matter how much they talk about 'republican freedom,' &c. Corruption is rife in political circles, politics (as we understand the term) are replaced by sordid intrigues which permeate every branch of social and commercial life, an election without fraud or violence is a rarity, and the finances of these republics are the laughing-stock of the civilised world.

It is true, some of the South American republics, such as Argentina and Brazil, have followed a sounder financial policy of late, and the 'boom' which these two countries have enjoyed may be attributed in no small measure to this fact. But there are others whose finances may be described as a hopeless wreck; and the experience of these countries, if it does not 'adorn a tale,' ought certainly to 'point a moral.'

The matter is of much greater importance than the stay-at-home Englishman might imagine. Let us suppose that in England, instead of gold and silver, the circulating medium and legal tender consisted of a fluctuating paper currency, the value of which, reckoned in gold, varied from day to day. Let us go still further, and suppose that it was impossible to buy gold or silver at any price, and that none of the banks would sell drafts on foreign countries or drafts of any kind payable in gold. It may be maintained that such a situation is ridiculous and impossible. But such a situation has prevailed more than once in the smaller South American republics, such as Paraguay, where it is the actual situation at the time of writing this article. A friend of the writer in Paraguay several months ago realised all his available assets, with the intention of leaving the country. On arriving at Asuncion, the capital, to take out his passage, he found that gold was unobtainable at any price, and neither of the two local banks would sell drafts on any foreign country. As he could obtain no gold, and as it was useless to take with him the fluctuating paper notes which formed the circulating medium of the country, which are almost valueless and unsaleable abroad, he had to give up the idea of emigration and wait until better times came round. In the meantime he had suffered no small inconvenience and loss.

A situation such as this is easily explained. The circulating medium in Paraguay is a fluctuating paper currency which has been falling in value for many years past. When the Government requires more money it simply issues more notes, and with every fresh issue of notes—which are not convertible into gold as our bank-notes are—the whole of those in circulation depreciate in value. At present the Government of Paraguay is buying all the available gold and gold-drafts in the market. Whether this is with the intention of meeting its foreign obligations the writer is unable to state with certainty; but it is a fact. How is this gold paid for? It is to be presumed that the usual expedient has been resorted to—the issue of fresh paper money. This would account for the recent rapid depreciation of the local paper money—more than 20 per cent. in a few weeks; it would also account for the scarcity of gold in the market and the absence of drafts, as the local banks, having a comparatively small capital, can only draw up to the amount of their cover or credit, and presumably that limit has already been reached. But the Government of Paraguay for years has published no balance-sheet of income and expenditure, and one can only draw general conclusions. The whole matter gives a most unpleasant aspect of South American finance.

In Argentina a somewhat similar state of affairs prevailed at one time; but a few years ago, under the government of President Pelligrini, the currency—at that time a fluctuating paper one—was re-converted to a gold basis at its then existing actual value of forty-four cents gold to the paper dollar. As the ratio of value has never altered since, the currency of Argentina may now be considered

permanently established on a gold basis. This method of conversion is so simple and inexpensive that it is a matter of surprise that other countries which are now floundering about in a sea of inconvertible paper currency do not adopt it; but South American statesmen seem to give preference to visionary and impracticable schemes. It may be taken as an axiom, speaking of Latin-American countries, that the smaller the republic the greater is the financial folly of its Ministers. Smaller republics, also, are more liable to sudden revolutions than large ones, and this political instability is another disturbing factor.

In Brazil, also, financial matters have improved of late years, and the value of the milreis has been comparatively stationary in the neighbourhood of fifteenpence; it was formerly much lower. The Government of Brazil has on former occasions laid itself open to the charge of empiricism in its financial methods. To give a case in point. Some years ago, when the writer was living in Brazil, the Government bank (Banco da Republica) had an idea that they could raise the rate of exchange by a species of jugglery. With this object, when the other banks quoted the rate of exchange—that is, the value of the milreis—at tenpence, this bank would quote elevenpence or more. But as they could only sell drafts at this price at a loss, they avoided, under various pretexts, the sale of exchange at any such rate, which was a purely fictitious one, and soon became the laughing-stock of Rio de Janeiro. About this time the writer received from his London bankers a draft on Rio de Janeiro (in pounds sterling), payable in local currency (milreis), 'at the rate of exchange of the day.' The parties on whom the draft was made offered to cash it at the 'official' rate of the Banco da Republica, which of course would have entailed a heavy loss. On the writer protesting against the exchange at this fictitious rate, they offered somewhat better terms, but still the draft was cashed at a heavy loss. And here it may be pointed out that the words embodied in drafts 'payable at the exchange of the day' are in many cases a delusion and a snare. In Rio de Janeiro and Buenos Ayres, for example, there was, and probably is yet, no fixed rate for the *purchase* of drafts on London; the rates advertised and exhibited every day by the banks are those at which they *sell* drafts on London; and the customer himself is apt to be 'sold' if he imagines they will cash drafts at the same rate. In such a case he is at the mercy of the local bank or firm on whom the draft is made, who are practically free to name their own rate of exchange. A draft on London is much preferable to one made on a local bank, as the former is negotiable anywhere, and if the holder is not offered a fair rate by one firm he can take it to another.

The depreciation of the currency in Latin-American countries sometimes gives rise to queer situations, and many humorous stories may be told in this connection. When the writer was travelling in the United States some twenty years ago the Mexican dollar was worth about eighty-five cents United States gold. On the Rio Grande the American town of El Paso stands facing the Mexican town of Paso del Norte on the other side of the river. Drinks at the bars in either town cost fifteen cents local currency. One morning, as the story goes, a cute Yankee, after ordering liquid refreshment in an El Paso saloon, tendered in payment an American dollar, and received for change a Mexican dollar, value eighty-five cents. He then crossed to the Mexican side of the river and repeated the operation, giving in payment this time the Mexican dollar he had received, for which he got as change an American dollar, value eighty-five cents local currency. And so he continued until a late hour in the day, when, after having indulged in a certain number of 'gin fizzes' and 'cocktails,' he finished with the same dollar he had commenced with in the morning. This is the story as it went the round of the papers at the time. Unfortunately for the veracity of the American reporter, though it is quite true that the Mexican dollar was worth only eighty-five cents United States gold at the time, the converse was not the case; the United States dollar has always been at a premium in Mexico. The state of things related by the reporter is practically impossible.

The complications caused by a fluctuating currency are numerous. The rate of interest on deposits in some South American countries is 12 per cent. or more. This seems to be a good rate of interest; but if the account is kept in local paper currency the result may be far from satisfactory. Let us suppose that a depositor recently arrived from England converts his available cash (say one hundred pounds gold) into local currency, and deposits it in a bank at 12 per cent. interest. At the end of a year he withdraws the principal, plus 12 per cent. interest. But as the local paper has depreciated in value to the extent of 25 per cent. (nothing unusual) in that time, he has in reality not only lost his interest but a part of his capital as well. Book-keeping in England is a simple matter in comparison to what it is in those countries which have a fluctuating currency. In the case of a wholesale house, for example, as all imported articles have to be paid for in gold, merchants generally find it convenient to sell such articles also for gold; while articles of local production are bought and sold in local paper currency. This involves the keeping of a double set of accounts for nearly every customer. Accounts payable in gold, however, are seldom paid in coin, but in paper currency at the exchange of the day; so that continual conversions have to be made from the gold account into paper, and *vice versâ*, at a rate of exchange which is continually changing. This question of exchange gives rise to constant disputes, annoyance, and lawsuits.

In countries with a fluctuating currency every commercial transaction partakes more or less of the nature of a speculation. The retailer, for example,

buys from the importer in gold, and gives his note to pay in gold—that is, in paper at the exchange of the day, for there is little real gold in circulation—four months later. But he has to sell to his own customers in local paper currency, which is the only legal form of tender, and he cannot tell what the rate of exchange will be four months hence when his bills fall due. The gold premium has by that time perhaps increased 30 per cent., and if he has sold his goods at 25 per cent. over cost price he has really lost instead of gaining anything.

The matter is still further complicated sometimes by vexatious legislation. So much is this the case that a clause is frequently inserted in promissory notes to the effect that the holder will be indemnified by the acceptor for any loss which the former may sustain through unforeseen legislative enactments—a law making payment in gold illegal, for example. Anything is possible in South American finance.

When the writer lived in Venezuela, some years ago, that country had perhaps the best monetary system in South America. He is not aware that there has been any change since, though in that turbulent republic there is little guarantee for the permanence of anything. In that country there was no paper money of any kind in circulation. The basis of the currency was the bolivar or franc (exactly of the same value as the French franc), and gold and silver coins of the principal European countries and of the United States circulated as legal tender at their full value. The English sovereign, for example, had a legal value of twenty-five and a quarter bolivars or twenty-five and a quarter francs.

In Uruguay also the currency is on a sound basis; the Uruguayan gold dollar is worth even more than the United States dollar, and there is no depreciated paper currency.

What is wanted just now in South America is a school in which politicians will be taught the elements of political economy and political finance. Nor is this want altogether confined to South America.

# THE FORGOTTEN ROCK.

## CHAPTER II.

They have hoistit sayle and left the land
All in the Nor'land Sea.

IT was Sunday. The bells proclaimed the glaringly obvious, their voices in the still morning carrying far inland over green champaigns, over the brigades of pines, over the links where the bloom of the gorse had laid its magic hand, and waste places shone with golden tapestries. He who makes the Heavens rejoice and the Earth be glad had set the drab town under an arch of summer sky beside the enchantment of a silver sea; but it was Sunday, and the inhabitants had pulled down their blinds. The singular and deadening error that the seventh day is the direct heir-of-line of the Jewish Sabbath flourished there. The swings on the common were locked, for the bairns might use them rather than befog their poor little brains by trying to commit to memory mysterious, unfathomable paragraphs from the Shorter Catechism that their fathers and mothers had wept over, forgotten, and never understood. Truly, Scots Presbyterianism, especially on fine Sunday afternoons, has been watered by a nation's tears! The Free Library, too, was closed. Idlers might have wished to read there instead of sitting smoking, exchanging sculduddery jests, and dangling lazy legs over the pier-head. In the houses, behind the blinds, people were furtively clothing themselves in depressing Sunday garments. A dead hush lay on the place, broken only by the bells, the screams of the gulls, or the howl of healthy, cheerful babies not yet introduced to 'predestination' and the rest of the joyous jousts of the creeds. To them Sundays were as other days.

The skipper was about to sail. He had sent the bairns to the kirk, and he and Jean were alone. Like her husband, she was from the fishing-class, trained in the narrow, half-Hebraic village outlook, cradled in an atmosphere of sectarian bickerings, where kirks were weapons of offence, families divided, professing Christians sincerely at each other's throats, yet serene and complacent in their belief that their own particular temple was the True Avenue. Hugh and his wife were no worse, indeed rather less limited, rather more charitable, than their neighbours.

'It's a peety ye maun sail this mornin', an' it the Sabbath-day,' said Jean. This was her way of heralding a good-bye.

'It's a wark o' necessity, my lass—a wark o' necessity,' quoted the skipper. 'Forby, it's a sodger's breeze an' a fine, canny sea.' He omitted to mention that to catch the tide meant more profit to his owners and commission to himself. 'We should be abeam o' the Naze o' Norway in twa days.'

'Ye'll be gangin' tae the kirk when ye're awa', Hughie?' said the goodwife.

'Whiles,' was the honest reply. 'I doot if it's muckle odds when ye dinna understand the language. I can warstle wi' Danish an' Swedish, but Finnish fair wanders me. To be sure, the tunes in some o' the kirks up the Baltic are awfu' like some o' oor ain. There's ane for a' the warl' like "Kilmarnock." I whiles shut my e'en when I hear it an' think I'm at hame.' He hummed a

stave in a sabbatical and lugubrious quaver. In his heart of hearts the Scot believes that the grave, sweet melodies like 'Kilmarnock' and 'Balerno' shall be raised in Paradise; and indeed there might be worse. There is nothing tawdry about them.

'No' that I haud wi' some o' the foreign kirks,' he went on, 'Protestant, mind ye, an' a' that; but there's pictures in some o' them worth thoosan's o' pounds, an' great lang candles.'

'Preserve 's!' said Jean, 'they micht as weel be Papists,' using the correct term with an implication of reproach, as many ill-informed Protestants do. 'They'll ha'e prayers for the deid, nae doot, an' images o' the Virgin Mary.'

'I wadna gang that length,' said Hugh judicially. 'No, I wadna mind the pictures, although I dinna like to see sic bonny things in a church; but as for prayin' for the deid, it's jist contrary to the Word! Still, they're no' as bad as the releegions in some places I've sailed to. When we were loadin' fruit in Spain at the back-end o' last year ye wad see processions o' them wi' flags, an' incense, an' images, an' fiddles, an' sic-like, an' the hale jing-bang o' them singin' as crouse as if they were as shure o' their reckonin' as oorsel's! Ay, it's a queer warl'.'

'Losh, Hugh, that's awfu'!' ejaculated Jean.

From the harbour the 'girn' of the *Covesea's* winch came up the quiet street. The skipper rose.

'Weel, Jean, I maun be awa'! Ye'll mind an' pit some mair sticks amang the sweet-peas.' He glanced round cautiously to see if any one was looking, and then kissed his wife good-bye. The Scot is a passionate lover, but as shy as a schoolboy of vulgarising his emotions. He dislikes and distrusts public displays of feeling. While many a good fellow says his prayers on his knees at home in secret, nothing will induce him to do this in the kirk before the 'neeburs.' He keeps his finer emotions on ice. Sometimes, alas! they die of cold.

When the skipper reached his ship he found Westwater below in his cabin, busy unpacking. The tide was flowing. The wind carried the pungent smell of the good, fresh seaweed in it. Groups of sailors, smoking after breakfast, stood in knots on the quay watching the *Covesea* cast off. The big, warm sails of the late home-coming fishing-boats shone red in the sun against the snowy breast of the Firth. Wheeling seabirds on silent wings swung ponderously round the vessel's spars. A sentinel gray-backed gull stood poised on one foot on a ship's truck. A herring was tossed carelessly over a fishing-boat's side; down swooped the watchful sentry with a bo's'n's pipe to his mates, and in an instant the air was full of clamour, light-hearted dissonance, and the twinkle of a hundred wings, white and gray. The boats in the harbour jostled one another good-naturedly in the gentle lift of the waves as the rising water gurgled along the wharves, creaming brown eddies whirling round the *Covesea*, throwing sparkles to each other as they danced, a high carol of sounds leaping into the morning air; and through it all a canorous diapason lent by the incoming tide drawing a breath at each of the worn harbour-steps as it mounted them slowly, on sure foot.

Hugh went on to the bridge, a fisherman-pilot beside him. There was a shouted order or two, a hurry and bustle of her moorings being cast off; three long blares from the siren, a *ting-ting* from the engine-room telegraph; a pulse-beat from below, another, and another, and the *Covesea* began to creep cautiously out. She passed through the pier-heads, and lifted to the sea as the Firth welcomed her with a friendly splash across her bows. Soon the pilot was dropped, and in an hour Findburgh was a brown blur far astern.

The *Covesea* was a good, safe, sea-going tramp, with no pretentions to speed, jogging along comfortably at nine knots. The light of the Naze of Norway in due time waved her the signal of an old comrade. Hugh Flett knew the North Sea and the Baltic as well as he knew Union Street in canny Aberdeen, and the *Covesea* slid up the Skager Rack and round the Skaw ahead of her time. Soon she left the Trindlen and Anholt lightships behind; passed the Kullen lighthouse, Elsinore bathed in sunlight from the gray clock-tower of the castle to the spray below Lloyd's signal-station on the beach; the toy island of Vheen, with its trim Noah's Ark fields, village, and spire; the splendid gleaming front of beautiful and light-hearted Copenhagen, Fœsterbo lightship on the port quarter, and the *Covesea's* sturdy bows headed up the busy highway of the Baltic.

The geologist-purser was a model passenger. He did not shoot poor, hungry, questing gulls. He did not drive the chief-engineer demented by fifty questions a day. He did not ask why when 'port' was the course wanted the order given was 'starboard.' He did not grumble. He did not fuss. On the contrary, he lounged comfortably, basking in the sunshine, contentedly reading in a deck-chair. He smoked excellent cigars, giving them away freely; and though he was not a talker, his quiet interest in everything, and his friendly nod and smile, soon made him a favourite, from the dour first-mate to the grimy, sweating firemen.

The skipper and he were pacing the deck aft, around them the surprising and mystical white radiance of a summer night in the Far North. The sun had held his long northern court, dying slowly, splendidly, loath to desert even for an hour the fair sky and sea. Companionable sails and trails of smoke showed white and black on the wide floor of the ocean. Familiar voyagers of the Baltic passed and repassed. Here a dainty, dancing white butterfly of a yacht; farther out, a battered veteran, with the 'Norwegian house-flag'—a windmill pump between the main and mizzen; well-handled Swedish coasters; grimy, lumbering coal-boats; a smart Helsingfors passenger-steamer, gold-laced officers on her bridge, near enough to throw a tinkle of music from her deck to the *Covesea* on the quiet evening; a Parrot Liner, green-hulled,

red-funnelled, her engine-beats singing 'In a hurry! in a hurry!' steaming steadily onward; deck-laden timber-tramps, with heavy lists, like tired old woodmen trudging along bent under their loads of sticks; a gray, furtive 'destroyer' stole swiftly ahead; finest sight of all, a full-rigged sailing-ship spanking joyously along like a roe, every snowy sail set, grace, speed, strength in her yards and tall spars, the water curling in green and white feathers from her cutwater, a delight against the rose gleam of the sunset.

A bright churned track, the long, straight path of a well-steered ship, stretched in the wake of the *Covesea*, changing terraces of colour thrown on it as the sun's last few rays touched the sea. The two men leaned over the taffrail in a long silence under the spell of the white, shadowless northern evening.

'"And only man is vile,"' quoted Westwater.

'Ay! that's oot o' a hymn,' quoth the skipper after a pause. 'No' that I hold wi' human hymns, nor yet wi' the paraphrases. Forby that they're forbidden, hymns are owre pleasant for the kirk. They belong to the vanities that perish. Gin a body has a bit o' an ear for music ye canna keep your mind on the words an' awa' frae the singin' o' the tune.'

The other man smiled. 'I'm afraid you're as human as the hymns, skipper,' said he.

'Maybe; but the less the better, I'm thinkin', for a man maun ha'e ither rules than human for his keepin'. We've got the chart, an' there's no excuse for gettin' lost or off the coorse, except, ye ken, the act o' God, the Queen's enemies, fire, an' the other things ye read aboot in the bills o' ladin'.'

'That's rather what sportsmen call a good mixed bag. Suggests perhaps to some minds that the Queen's enemies, fire, and the rest of the bills of lading exceptions came of their own pleasure, and not the Almighty's, eh?'

The skipper's wits moved slowly. He gave a non-committal grunt.

'"The Lord giveth an' the Lord taketh away,"' said he. It was not very original nor very relevant, but there was a vague comfort in a text.

Westwater paused for a moment, and waved his hand at the moving dots of the shipping on the darkening horizon. 'Look at the sails,' he said. 'Do you know what they always remind me of on a wide sea like this? "All sorts and conditions." You follow me?'

The skipper shook his head.

'Human souls,' he went on musingly. 'Some serene, steady, well-handled, to sail always on, never losing a spar; others doomed to drift, hopeless, pitiful derelicts, a curse to themselves and to every one, to leave their bleached bones on a lee shore, or to grope blindly in heart-shaking fogs to yelling breakers, and—darkness. Faugh! I'm talking cheap Adelphi padding.' He paused. 'Isn't the sea cruel, like life—a jest, a handicap, a lottery?' He was staring over the wide waters. He might have been hardly conscious of the other's presence. '"Do we move ourselves, or are we moved by an Unseen Hand at a game?"'

The quotation was far off the skipper's 'beat.' Philosophy, cowardly or otherwise, was to him an unplumbed depth. A vague irritation touched him. 'I dinna ken. Like enough it's beyond me,' he said abruptly, and stopped, groping mentally, when the very bright gleam of a deep-sea light suddenly stabbed the gathering dark. The skipper saw it, straightened himself, and the needle of his mental compass steadied. 'There!' He pointed a big brown forefinger at the clear light. 'Green pastures or the great waters, a man has plain lichts to steer by. Man, gin I spend my time in a swither wonderin' which licht was which, or seekin' short-cuts for the *Covesea*'—he laid a hand on the ship as on some faithful animal—'roon' corners to save a tide, I'd pile her up, an' like as no' gang wi' her to the bottom, an' serve me richt. A man's deep-sea lichts for his life's cruise are as plain as port an' starboard. No shorts-cuts for me.'

'True! The devil's best-dressed fly,' murmured the other.

The skipper was instantly all attention. 'What's that aboot a weel-dressed fly?' he asked. He threw as pretty a cast for sea-trout in his native river as most men.

'Short-cuts. The palm without the dust; gold without sweat. I mean that a short-cut to happiness is the devil's best-dressed fly for us poor gudgeons,' said Westwater in his deliberate, musical bass, staring intently seaward into vacancy. Then suddenly he turned and asked, 'Do you find it easy to be honest?'

A gust of amazement and vexation shook the skipper. Had he not just delivered what he thought was a moral disquisition on guiding-lights—guiding-lights for every one? But of course any reference to potential sinners ought obviously to be taken to refer to his neighbours, not to himself, Hugh Flett, elder, master-mariner, who had just labelled so neatly the finger-posts of rectitude. With all his liking for Westwater, he nearly snorted at the thought. 'Gold without sweat!' 'Us poor gudgeons!' And then to be asked point-blank did he, Hugh Flett, find it easy to be honest!

'Me!—me! Have I no' jist been tellin' ye that—that'——

'Among other things, that short-cuts are temptations,' cut in Westwater, 'and I thoroughly agreed.'

'Honest! As for bein' honest,' growled the ruffled captain, 'the order fair hits ye atween the e'en. I found it easy to obey a straicht order, an' I always wull: "Thou shalt not steal!"'

A chill night air stole over the water. Westwater shivered slightly. There was a jarring silence for a minute or two.

The skipper looked at the log, and went forward. He grunted a sudden word or two to the man at the wheel, causing that startled functionary to keep his eye on the compass as one mesmerised. Then he stared for a moment at the hands. He shouted

an order, and addressed his men in a gloomy crescendo. Where were seamen, good thorough seamen, nowadays? he asked, with black and bitter emphasis. He would tell them, he added lugubriously. They were under the sod. Under the sod! There were none left. None left, did they hear? None who could tie a granny knot. All the hands were fit for was the carrying of a Sunday school trip from Buckie to Lossiemouth—that is, if it happened to be a fine day and they had a captain who could do without sleep. Heavens! did they think the owners paid them to be able to chew tobacco and whistle at one and the same time? for that and the Sunday school trip was about all they were any use for. He supposed it was no good trying them to get a 'move on.' Chasing snails off garden walks—that was what they were fit for. And so on, until the dolorous mechanism of his jeremiad ran down, and he turned aft, a little breathless, but relieved.

'Old man's got his dander up aboot somethin',' said the second-mate to the steward. 'Fairly up! Gi'e him a top-hole breakfast to-morrow mornin', my son o' Aberdeen, or your name's Mud!'

The steward winked. 'He'll be a' richt in ten meenits. It's me that kens,' he said with complacence. 'I've sailed wi' him for nine year come Martinmas. I dinna mind him ravin' at lairge. He's worse when he throws texts at ye, or says naethin', an' jist glowers at ye like a hoolit. But he'll be a' richt in ten meenits. Ay! it's me that kens. Ye micht sail under worse.'

'Cold, captain. I think I'll turn in,' said Westwater, an added touch of friendliness in his good-natured voice, when Flett came back. 'Good-night.' He held out his hand. 'We are not really disagreeing about anything, are we? And we'll keep the buttons on the foils.'

The steward spoke sooth out of his nine years' experience of the big captain. Already his letting off steam had smoothed his vanity. The two men shook hands. The skipper put more into his grip than his spoken 'Good-night,' and the ghost of his ruffled temper vanished over the side. Westwater went below, and Flett continued his quarterdeck walk, his little volcanic molehill of righteousness crowned by the red twinkle of an excellent but smuggled cigar. Above, in the darkening, a gull laughed suddenly.

Early next morning a soft, ribbed pencilling on the horizon marked the land to sailors' eyes. The pencilling resolved itself into a score of dots, inconsiderable as a string of wild-fowl in the distance, growing gradually to a cluster of barren islets, the outposts of a labyrinthine army of half-covered, treacherous rocks in the Gulf of Bothnia. Here and there a larger isle lifted a brown shoulder out of the water. From behind one of them a tiny, hurrying sail slid out, and a smiling Finnish pilot, smoking the inevitable light-brown little cigarette, climbed nimbly up the side. The ship crawled cautiously along at 'dead slow,' threading her way round the buoys and beacons marking a rock-strewn, narrow channel. Pilots were changed twice. The islets grew in size and beauty as the channel widened, dense woods covering them down to the clear water's edge, here and there a beacon-tower rising white among the trees, red-roofed Finnish hay-barns warm points of colour against their green. Few sounds came from the shore as the steamer picked her way alongside. Wood-pigeons called, bright-eyed and curious, from the still woods. Wild-duck arose and fled clamouring, ripples in their wake, their long necks outstretched, the *whir* of their short, strong wings steadying into a faint hum in the distance. Save for such sounds, no life-beat came from the land, no smoke rose, no houses beckoned. The islets are seldom touched at except by wandering sportsmen in the short summer and autumn, for the long northern winter takes them in his slow, cold arms, covers them with snow, holds them and their waterways for dark, lonely months helpless, white, silent, in a dead sleep. No wonder that the Finlander, more than most men, loves the sun, colour, and flowers.

The yellow funnel of the *Covesea* crept steadily north far off the beaten track, the pulse-beat of her engines strangely loud in the summer hush, until, rounding a birch-clad, rocky spit, her anchor was let go alongside a rude timber-wharf, flanked by tumbled granite blocks; above her, near the crest of the isle, the red gash of a quarry rending the cool Lincoln green of welcome woods.

*(To be continued.)*

---

# PLUNDER.

By F. D. M'MILLAN.

THAT interesting Anglo-Norman scribe William of Malmesbury gives the following passage in a general description of the state of perfection to which the laws of England were brought under Alfred the Great, and the way in which they were administered: 'So exact was the general police that Alfred hung up, by way of bravado, golden bracelets near the highways, and no man dared to touch them.' The incident is described no further, unfortunately, and, although presented as a historical fact, will not perhaps bear strict examination. One wonders what would have happened to the perfectly honest passer-by who might have considered it to be his duty to discover the owner of the bracelets, and removed them for that purpose. In any event, we might have been advised if a police-

trap was set, and how long they were left hanging in position.

It is instructive, nevertheless, to consider by way of contrast an occurrence witnessed recently within a hundred yards of St Paul's Cathedral, London. On a certain Saturday evening a man smashed a pane of glass in a jeweller's window, pulled out a large tray of rings, and, after grabbing a handful and scattering the remainder over the pavement, dashed off. There promptly ensued a wild scramble on the part, so it is said, of practically the whole of the persons passing, both sexes taking part in it, and then promptly making off, the evening being somewhat foggy. The almost incredible upshot of the affair was that not a single ring found its way back to the jeweller, nor was one person apprehended. It is presumptuous to moralise in the face of this instantaneous and apparently unanimous decision to plunder; but it is a sad fact that robberies, with and without violence, and thefts of all kinds, have been continually increasing for some years.

Considering the valuable nature of their stock, jewellers have comparatively few losses from attempts of this nature. In London, for some unfathomable reason, opticians suffer most from the singular type of thief who will hazard all upon a sudden smash, a few seconds of pillage, and for the rest trusts to speed and his knowledge of adjacent byways to enable him to escape. The explanation may lie in the curious tendency that thieves show to specialise in different classes of property; in which case jewellers and silversmiths may be looked upon by the fraternity as the peculiar preserve of the swell cracksman with scientific methods of his own.

It is to the contents of safes and strong-rooms that the really expert mechanic-thief directs his attention, and there is probably no safe in existence which he could not break open, given sufficient time and the proper implements. The makers of safes would appear to recognise this in having adopted the term '*burglar-resisting*' rather than '*burglar-proof*.' Ordinary small safes offer practically no resistance whatever. In one case, not long ago, a safe three feet by two was carried from a post-office to a piece of waste land and actually forced by means of a garden spade and a coke-hammer.

In dealing with thief-resisting safes it is only infrequently that burglars attempt to tamper with the face. A safe is no stronger than its weakest part, and this is usually at the back, or the base, or especially along the line of juncture of the two halves of the outer casing. Great trouble may be taken, therefore, to wrench fastenings away, and if the safe is partially embedded in masonry of poor quality the first attack may even be made on that. To render them thoroughly secure, safes should be built strongly into the fabric of buildings, or so otherwise fixed as to present the almost impregnable front only. Unsecured safes are often carried away bodily.

Burglars probably fear burglar-alarms more than they fear the police. These are fitted invisibly under floorings and to doors and windows, and ring loudly in the street, or in a bedroom where an alarm will be raised. To gain access to the shop from the back room of a jeweller's premises burglars have been known to bore a hole through a brick wall rather than open a door which was merely latched. The expert cracksman, however, who plans and executes immense hauls of jewellery or forces chilled-steel burglar-resisting safes in a search for cash is a rare bird, and the doings of his humbler brother of the housetop and the false key are probably of more interest to the majority of readers.

The tendency to specialise in the selection of property which is so often remarked was curiously shown in the following case. A lady's bedroom was entered, and a Gladstone-bag procured from under the bed. On the dressing-table was the usual silver: tray, mirrors, brushes, scent-bottles, and powder-pots. These articles remained untouched, while the bag was packed with lace handkerchiefs, blouses, silk dresses, and costumes. The thieves probably had a ready market for articles of clothing and wearing apparel, but no means of melting or disposing of the silver, which was of far greater value.

It is most unwise to leave a house unoccupied at certain hours day after day. This is frequently done where a daily girl who works in the mornings only is employed, the mistress regularly spending her afternoons in visiting and shopping. In almost every large town there are numerous gangs of thieves who practise more or less elaborate systems of espionage in order to break into private dwellings in the daytime. For this reason, houses facing or backing on to commons, parks, or other open spaces receive a disproportionate share of these unpleasant visits. Such premises stand open to the closest inspection from early morning till late at night, and the habits of the various occupants can easily be subjected to continual scrutiny by persons whose movements need not excite the slightest suspicion.

The following are some of the methods of these daylight thieves: (1) Calling at houses on various pretexts to ascertain if any one is in. (2) Watching the habits of tenants for some days, and noting how many persons reside in the marked house, and how much time is likely to be available when the opportunity for entry offers. (3) Causing a disturbance in another street near to distract the attention of the police. (4) Calling to clean windows, as 'the regular man is ill.' (5) Gaining entrance to halls or reception-rooms on false pretences or by tricking servants.

The following clever example of the last may be given: Messrs Rose & Thorn's delivery-van called at Lady A.'s to leave a box containing twenty pounds' worth of what we may call frippery. A few minutes later a man knocked loudly at the

door, and, on its being opened, asked quickly and showing signs of much haste, 'Has Messrs Rose and Thorn's van been?' He was informed that it had. 'What a pity! I hoped to get here first. There has been a stupid mistake, and the wrong box left.' As he was displaying another box of the same firm's, he was allowed to leave by the unsuspecting maid, with a box under each arm. The police attributed three similar thefts to the one man that same afternoon, without, however, catching him.

An even more daring *coup* of a different class was carried out by two men, one tall and the other short. A house left temporarily uninhabited having evidently been carefully selected, the short man knocked at the door, while the tall man remained at the gate. No answer being received to the first knock, a second louder one was given, the tall man meanwhile strolling slowly up to the door, where his bulk hid the smaller man from observation. Two moments later the door opened, and, after politely raising their hats, the men entered, closed the door behind them, and proceeded to ransack the house. When they left an hour or so later each carried a loaded portmanteau. This happened in the bright sunshine of a summer afternoon, in full view of persons sitting at the windows of opposite houses. The screened man, of course, had cleverly and quickly forced open the front door after the second knock. The remaining details were subsequently supplied by the unsuspecting witnesses from across the road.

In giving instances of occurrences of this nature one suffers from *embarras de richesses*. They are innumerable, and nearly all possess features of much interest.

The police in some districts have of recent years been confronted with another aspect of this difficult problem—namely, housebreaking by women, and even young girls, often of perfectly respectable appearance. Such persons can watch a house for days without attracting attention, and frequently get away by advancing ingenious excuses even when actually caught upon premises where they have no right to be. Brazen impudence, altogether above the head of the mere male burglar, carries them through. The police usually have little difficulty, after a burglary, in determining the sex of the delinquents. The fact that ladies' clothes have formed the bulk of the booty is almost negligible, because, as we have seen, there are male 'clothes-burglars' who confine their attention to female wearing apparel. Typical female burglars hunt in couples. Entry to the marked house is usually obtained by means of a false key. The simplest form of false key is manufactured from an ordinary button-hook such as every woman possesses, merely by hammering the hook out straight and at right angles to the handle. These 'burglars' rarely damage property; they have an unerring eye for secret hiding-places, however, and usually cover up all traces of their depredations as they go along. In one instance the fact that female thieves had been in a house was not discovered until some weeks after the family had returned from holiday, the contents of two secret drawers of a jewel-box and a valuable fur coat being the only property missing.

The ordinary burglar frequently does serious damage, which may be classified as follows: (1) Damage consequent either upon breaking into the premises through internal doors or in the search for booty. (2) Wanton damage done for no apparent reason, but sometimes attributable to disgusting superstitions. (3) Malicious damage due to dissatisfaction with haul. The first class must be considered inevitable. It is more difficult, however, to bear with fortitude losses which are consequent upon the second and third classes.

No account of burglars and their methods would be complete without reference to London flat-robbers. The London flat is usually given flimsy Swedish doors, with leaded-glass panels. A caretaker is sometimes engaged for duty in the main hall; but having little to do, he usually manages to do less, and is rarely in evidence. It has been cleverly said that 'the proof that a hall-porter is engaged is that he cannot be found. If a man is loitering about who might be the hall-porter, the odds are that he is a burglar.'

In the west and north-west of London there are thousands of flats, and their construction and the mode of life of many of their tenants are largely responsible for hosts of flat-thieves. The district known as Maida Vale is notorious. Having to call at a ground-floor flat in a block containing perhaps three hundred persons, the writer learnt that not only had that flat been broken into during the previous month, but that every ground-floor flat in both directions, and many of the upper flats, had been forcibly entered at least once within the previous eighteen months or two years, some of them two or three times.

Two flats at the top of a block were both left unoccupied one afternoon. The tenant of one was a nervous old lady, who, however, lived alone. She had had a special lock with seven bolts fitted to her door. The tenant of the other was Madame S. W., a professional singer. On the afternoon in question both ladies were out, the latter having taken her servant to go shopping, and left a pug-dog at home on guard. It was afterwards calculated that it took three men less than half-an-hour to ransack those flats. One, by the way, did nothing but stand about the hall, where he was seen by other tenants on their way out. Meanwhile the other two forced the doors, went into every room, spread the contents of chests of drawers upon the beds, and littered the sitting-rooms from end to end. Madame S. W. returned to her rifled home, to find herself poorer to the extent of about one hundred pounds' worth of jewellery and silver; her household gods were scattered far and wide, but the pug-dog slept serenely on the couch.

Speed and daring are the chief characteristics

of the work of the expert flat-breaker. Two 'specialists' will force a door, force the drawers of a sideboard, proceed to the bedroom and break open wardrobes and the drawers of dressing-tables or chests of drawers which might be supposed to contain valuables, leave the flat with a stolen portmanteau stuffed with silver, jewellery, and furs, and be safely out of the block well within the space of twenty minutes. Nothing appears to be too much trouble, if it can be speedily done. If a drawer in a wardrobe is strongly locked, the whole wardrobe may be swung round so that the light will fall upon its back, and first the back itself be smashed in, and then the back of the locked drawer.

It is hardly an exaggeration to say that entry to some of these London flats is so easy that any one of half-a-dozen ways may be employed to suit different circumstances. Thus, if time is no object, what more simple than quietly to tap out one of the leaded lights of the front door? It is then only necessary to insert the hand in order to pull back the catch, and the door is open. The doors are so flimsy, however, that it is nearly as simple to force them. Then, again, the windows often offer a ready means of admittance. Goods-lifts as well as passenger-lifts are also made free use of.

One other class of thief must be referred to: the class which brings a pantechnicon van and removes the whole contents of a house. Such occurrences are by no means so rare in very large towns as is generally supposed. From their nature, of course, they are infrequent, necessitating as they do the use of a trade pantechnicon van, slow work of some hours' duration in broad daylight, and the subsequent disposal of the huge quantity of stolen property, to say nothing of the van and the horses. Episodes of this nature are not always chronicled in the newspapers; but three such cases have come to the knowledge of the writer within the last twelve months.

## CROCODILE REMINISCENCES.

By A. CAVENDISH.

FISH and dog stories we all know, and are accustomed to swallow with 'salt to taste;' but it is only given to those whose path lies off the beaten track to hear, first-hand and in the vernacular, the inevitable crocodile-stories with which the river-dweller of the Eastern tropics loves to regale his white guest, sitting smoking long native *rokos* in the semi-darkness, during the hour between the evening meal and bedtime.

What the fish and dog story is to us, so is the croc.-story to the jungleman. He even goes further. He ascribes to the crocodile supernatural powers; he surrounds him with a halo of romance; he propitiates him with periodical offerings; and when diplomacy fails, he declares war to the death—war lasting perhaps for years, till some trifling occurrence is construed into a sign of surrender on the part of the crocodile, and all is peace again.

Wonderful indeed, and hard to believe, are some of these native stories; but the majority of them are true for all that, though the fascination and glamour of them fades when the smooth, musical Malay tongue is changed for matter-of-fact English, and the flickering glimmer of the *damar* torch on palm-leaf walls is replaced by the lamp and writing-table of civilisation. For these reasons I have confined myself to recounting a few of my own personal experiences, in which, I fear, the crocodile figures, not as the native reads him, but as I have found him—savage, crafty, and loathsome to the last degree.

But to begin at the beginning. My first experience of the 'river king' was many years ago, when circumstances compelled me to travel for several hours, in an extremely rickety and dilapidated dug-out, along a tortuous and stagnant, mangrove-lined creek. I had not been long in the tropics, and my great wish was to see—and, if possible, to shoot—my first croc. In the dug-out with me were my Chinese 'boy' and the ancient owner of the craft—who, by the way, supplied the motive-power with a paddle, while all my energies were directed towards keeping my balance and postponing the catastrophe of an upset, which each moment appeared more imminent. After an hour or so, when familiarity had bred contempt, and I was at length emboldened to stretch my cramped limbs and find a new and more comfortable position, I inquired of my venerable Charon whether there were any crocodiles in the creek. The old man, going as near to a chuckle as a Malay will allow himself to do, replied that I need not be afraid; that there *were* crocodiles, but that they were kindly beasts who never interfered with human beings. Feeling somewhat hurt at my inmost thoughts being thus probed, I relapsed into silence and a cheroot, and was momentarily growing more drowsy, when a remark from the old native brought my thoughts back to earth with a start. '*Itu dia*, there's one,' he quietly said, pointing with his mouth, in the native fashion, towards a tangle of mangrove-roots and rotting vegetation, while his paddle rose and fell with unaltered speed. 'There's one.' I looked, I gazed and peered among the mottled shadows, but nothing could I see that in any way resembled my idea of a crocodile. 'Where?' I asked; and then it happened. My Chinese 'boy,' ever anxious to please, had grabbed a piece of wood that was floating by, and hurled it violently at the spot indicated by the native. The next half-minute was chaos. In my anxiety to see

the crocodile I had raised myself up, and the lurch caused by the rash act of my servant in throwing the piece of wood made me lose my balance. I collapsed (luckily into the boat), some gallons of water came in over the side, and the old man at the stern, steadying the canoe with the quiet, instinctive movement of one who knows his business, muttered the one word, '*Bodoh!*' ('Idiot!'). As I struggled once more to a sitting posture I saw a long black object, which I had taken to be a log, glide noiselessly into the creek, hardly raising a ripple as it vanished, and I caught a glimpse of two beady, cruel eyes, which seemed to look greedily at me as they disappeared below the slimy water. I had seen my first crocodile; but whether the old man's last muttered comment was directed towards me or my servant I have never discovered, nor did I then feel inclined to ask. In either case it was richly deserved. This was many years ago; and though since that day some dozens of the loathsome reptiles have fallen to my rifle, I have never forgotten the look of malignant hatred and concentrated evil that was shot at me from those two yellowish-green eyes.

From past to present is but a step for the memory, and it is only a few months since the incident happened that I am about to relate. My work took me on a visit up a river to one of those timber-cutting camps where are felled and rafted the great hardwood logs so valued in the Chinese market. G., the white man in charge, was a characteristic old 'hard case,' who had started life before the mast in a sailing-ship, and drifted in a beach-combing fashion to our colony, where he had been given, almost in charity, a subordinate billet in one of the large timber companies. Arriving in my boat at the little jetty or landing-stage, I was astonished to find G. lying on a rattan couch within a few yards of the bank, with a heavy express rifle across his knees, gazing intently at a rough *pagar* or fence erected in the stream. Hanging from this fence, and a few feet above the water, were the corpses of a monkey and several pariah dogs; while half-a-dozen ducks, each tied to the fence by the leg with a long string, flapped about on the water and quacked dismally in their efforts to escape. I was just wondering whether the whisky-bottle or too much solitude accounted for this state of affairs, when I noticed that G.'s leg was swathed in rough bandages from knee to ankle. Throwing myself down near him in the welcome shade, I learned the following story: Two nights before, G. was sleeping peacefully in his little palm-leaf house, in a clearing about twenty yards from the river-bank, when his dog began to growl and refused to be silenced. G. turned out and walked round the hut to ascertain the cause of the disturbance, but seeing nothing, addressed himself to the dog in his usual lurid and picturesque sailing-ship language and retired to bed again. Five minutes later he was once more aroused by a yelp from the dog; and, this time really annoyed, he seized a stick and sallied forth to inflict dire punishment on the disturber of his dreams. Suddenly a dark form glided swiftly from the shadows, and G. felt himself seized by the right knee as in a vice. Stooping to free himself, he found he was in the grip of a large crocodile, whose teeth were firmly embedded in flesh and bone. Backwards and forwards the struggle swayed—the crocodile striving to pull its destined victim to the water's edge, and G., hampered as he was by his imprisoned leg, fighting for his life to reach higher ground. At last the beast, hurling its victim to the ground with a shake of its powerful head, began to drag him swiftly towards the water. Poor G., feeling, as he expressed it, that it was 'all over bar the shoutin',' determined to make one last effort for his life; and, taking advantage of a momentary halt as the brute was steering past a tree-stump, he sat up and succeeded in getting both his thumbs into the reptile's eye-sockets—the only vulnerable part of a crocodile's head. The rest of the story is perhaps best told in G.'s own words, or as nearly as circumstances (and the Editor) will permit: 'So soon as I gets my thumbs made fast in 'is eyes, 'e opens 'is mouth to shout, an' lets go my leg. Then, first thing next mornin', the coolies lays 'is breakfast for 'im, as you see, an' I gets into this chair, an' 'ere I stays, if it's a month.' Vainly I tried to persuade G. to come away with me to the next station and see a doctor. I argued with him, I implored him, but it was absolutely useless. He refused to move from that chair till he had bagged his crocodile; and I was at last obliged to leave him, having dressed his leg, and exhausted every known means of persuasion short of brute force. I met him again a week later lying in a hospital bed, suffering severely, but quite happy in the knowledge that the bones of that croc. were bleaching in the sun outside his house. Poor old G.! Only a few weeks afterwards the habit of clearing creepers from his path in the jungle with the butt-end of his loaded and cocked rifle proved fatal to him.

Perhaps the most firmly engrained superstition in connection with the crocodile—if superstition it be—is the belief that the washing of a mosquito-curtain in a river will be followed, within a week, by the death of some person in the village on its banks at the jaws of a crocodile. So implicitly is this believed that many villagers take their curtains to some jungle pool or spring rather than even use water drawn from the river—this though the same persons will bathe and wash their garments actually in the river itself! The offender is usually some travelling Chinese trader; and, curiously, no less than four cases have come to my personal knowledge in which the washing of a mosquito-net in a river has within a week been followed by the taking of a villager by a crocodile. In one case nobody had been taken in the river for over a year; and in another case the wretched Chinaman was arrested by the zealous local policeman, himself a native of the district,

and sent under custody to the nearest European magistrate, solemnly charged with causing death 'by a rash and negligent act, thereby committing an offence punishable under the penal code.'

An account appeared some years ago in the local papers of Singapore relating how the native hunting-dogs in that part of the world were so clever that, being desirous of crossing a river, they would first congregate on the bank and bark loudly to attract the crocodiles, and then run swiftly upstream and cross at another place. The tale was greeted with much editorial sarcasm, and commented on as 'something new in dog-stories.' A month or two later some incident recalled the story to my mind as I sat late one evening discussing the day's deer-hunting with an old chief, who himself owned the premier pack of pariahs in the district. I repeated it, as nearly as I could remember, to the assembled village, who with one accord sat silent, waiting for the words of wisdom to fall from the old chief. For some minutes he chewed his quid of betel-nut in a meditating way, and then broke out with the following explanation, which I give in his own picturesque phraseology: 'Wherever there is smoke one must seek the fire. This is a true story that has passed through many mouths. The way of it is this. It is not the cleverness of the dogs, but of the owners. The men of my people, when chasing a deer on foot with dogs, are always careful in crossing a river, for the yelping of the dogs calls together the crocodiles. The dogs, therefore, are trained to stop at the bank and bark loud and long. The hunters then cross at a place some distance away, calling their dogs, who follow in their masters' footsteps. This is truly how the story began; but it has altered in the telling, and is now like a child's fable.'

The very next day I had an opportunity of confirming this explanation, for a deer put up by my own dogs during my evening stroll made straight for a stagnant backwater of the river and plunged in, closely followed by my three yelping terriers, who swam round and round him, snapping at his back and sides as opportunity offered. Some village dogs, attracted by the din, came rushing up and joined in the chorus, but without attempting to enter the water. Standing on the bank, I was whistling vainly to my dogs, when the deer gave an agonised scream and disappeared below the slimy surface of the pool, pulled down by some unseen force, never to reappear, though I waited for a good ten minutes. When I left there was not a bubble nor a ripple to show what had taken place. But no explanation was needed as far as I was concerned; and my three terriers, following, cowed and shivering, at my heels, had learnt a lesson that they remembered for a long time; though two of them eventually fell victims to a similar fate.

I have discussed the habits and customs of the *buoia* or crocodile with many natives, and their solemnly delivered opinions would certainly open the eyes of any naturalist. The majority are firmly convinced that the beast has the power of fascination similar to that generally accorded to the snake, and they also believe that the crocodiles in any given river will not molest man unless man has first molested them. When recently being paddled up a small river for the first time, I was about to fire at a young crocodile lying on an exposed mud-flat. 'Don't, sir—don't!' cried the four paddlers as one man. I lowered my rifle and asked their objection. It appeared that in this particular river, though it swarmed with crocodiles, and the villagers habitually bathed there, nobody had ever been taken; while in the next river, debouching at almost the same spot on the coast, there was continual and bloody strife between the natives and the crocodiles. This was corroborated by other villagers on the river, who ascribed their immunity to the fact that they had never killed a crocodile there, and in return the crocodiles had never done them any harm. Whether or not this can be accounted for by the theory that a crocodile 'turns man-eater,' like a tiger, is an interesting problem.

## WHEN WE'RE GROWN-UP.

NURSE says it 's just a year ago
Since I came down to earth; and though
I'm not quite sure what she can mean,
I never let this fact be seen.

Another thing which puzzles me
Is, how it is that people see
How like to some one I have grown—
Some one I've never even known!

'How like his aunt in France!' they say.
'He gets more like her every day;
Her very eyes, her wavy hair,
Her saucy nose, too, I declare.'

I shut my eyes and try to seem
As if they've waked me from a dream;
Till by-and-by I hear them say,
'He's tired! Well, nurse, we mustn't stay.'

I learnt this very simple plan
From Mary Jane, the niece of Ann,
Who wheels me out, rain, hail, or snow,
And never asks me, 'Will you go?'

We've both agreed, Miss Jane and I,
When we're grown-up, at least we'll try
When we meet babies in the parks
To show some sense in our remarks.

The phrase 'How like!' we'll never use,
We'll only kiss them when they choose;
We'll never talk in silly words—
'Puff-puff' for trains, 'tweet-tweet' for birds.

The babies then, I know, will say,
'Of all the folks we meet each day,
Just two we'd like to see again—
Boy Blue' (that's me) 'and Mary Jane.'

# SOME NEW PEN-PORTRAITS OF CARLYLE.

By A. STODART WALKER.

THE almost simultaneous publication of *The Life of W. E. H. Lecky, The Letters of John Stuart Blackie to his Wife*, and *Memories of Fifty Years*, by Lady St Helier (Mary Jeune), supplies us, amongst other peeps into the characters and doings of many of those who count, with some graphic sketches of that leviathan in morals and dogmatic utterance, Thomas Carlyle. The Chelsea prophet was an intimate friend of both Lecky and Blackie, and it is interesting to observe that the two men, very dissimilar in the presentation of character, paint the shaggy old warrior in fairly similar colours. The portraits are doubly interesting as being the work of men with the gift of sympathetic utterance. The Irishman is probably the more enthusiastic, perhaps because he was the more patient; which seems a paradoxical statement to make when comparing him with a Scotsman. But neither Blackie nor Lecky was at all what may be called a representative man as far as nationality is concerned. It would be as idle to speak of the latter as a typical Irishman as to use the misleading journalese applied to John Stuart Blackie as a typical Scot. Indeed, there was more of the Scot in Lecky than in Blackie. Lecky was typical, indeed, in many ways of the hard-headed, clear-visioned Lowlander; Blackie was only typical of himself.

But however much Carlyle differed and disagreed with the two men, he served throughout the craftsmanship of his days as a sturdy friend to them both. Their visits were uniform and uninterrupted, in the heat of the day as well as in the cool of the evening, down, indeed, to those days when, as Lecky wrote, 'he is very weak and very melancholy, exceedingly tired of life.' Blackie's friendship extended over half a century, and, despite their battles, they never came near to a quarrel. For though Carlyle was generally one-sided, dogmatic, and fond of bringing under the lash those with whom he disagreed, he showed in his working days little of bitterness. The bitterness only peeped out in his later years when hope had failed and life had become a weariness to the flesh. However much he tore his opponent into metaphorical rags, it was always done with an unfailing good humour, probably on the scriptural principle of reproving and chastening those he loved. But as the shadows fell Carlyle seemed to have lost this genial spirit, which is an excellent discount to criticism. 'I took a cast down to Chelsea,' wrote Blackie, 'to see the old prophet. He was in a very grumpy humour, and said little either to please or edify; his old negative dogmatism without the agreeable flavour of good humour.'

Literature affords many characteristic examples of the tyrannical dogmatist who, in his own heart, possesses a gentleness of sympathy that attracts. Samuel Johnson was a portentous wielder of the verbal sledge-hammer, pounding his friends or his enemies without padding his club; yet was there ever a man so beloved of his fellows? Robert Buchanan was another of the species, though gifted with more imagination and a more playful sense of humour. Carlyle and Ruskin stand together, not only in their moral ideals, but in their glory in laying down the law without much consideration for a strict adherence to the simple facts of the case. In a letter to Miss Gladstone, John Stuart Blackie sums up the two: 'Carlyle was mighty to rouse, but useless to guide. He saw great truths with an instinctive glance of spiritual perspicuity; but no sooner had he seen them than, by a fevered habit of exaggeration, his sublime became ridiculous, and his great truth half a lie. Ruskin is another unsound genius of the same kind; only Carlyle is a giant and wields a club, Ruskin a nimble mortal with a bright rapier, the glamour of whose flash is more potent than the weight of its stroke. But,' adds Blackie, 'Carlyle will stand, (1) because he is the most picturesque of historical portrait-painters; and (2) because he is a hard worker, and never built his architecture with slight materials.' In a letter to his wife, Blackie again summarises Carlyle from

[*All Rights Reserved.*]

this point of view: 'Then I knocked up Carlyle, a strange mixture of gray, weather-beaten solemnity and hilarity; full of sweeping denunciations as usual, but not at all bitter. He is strong to arouse by a tremendous moral force, and to startle by vivid and striking pictures; but he has neither wisdom to guide those whom he has aroused nor sobriety to tone his pictures to reality. He is always talking about veracity, but he habitually revels in exaggeration and one-sided presentation, which is more than a lie. But we fraternised in a brotherly way, and embraced on parting.'

Mrs Lecky informs us, in the biography of her husband, that 'Lecky admired Carlyle as a genius and a moral force, but that he was in no way a disciple of his, and any one who did not reflect Carlyle's views never wholly escaped his criticism.' 'He talked much eloquent and exasperating nonsense,' wrote Lecky after one of his visits. 'As usual,' wrote Blackie, 'Carlyle laid about him all round with a bland, sweeping intolerance which appears to be the very reverse of wisdom. However, we managed to get on, as he was willing to take all the talk to himself, and I little solicitous to controvert.' In fact, we gather from all authorities that it was Carlyle's joy to talk and not to be talked to. The rugged old genius sat on his throne, crowned Sir Oracle, and poured forth his flood. 'His talking,' says Mr Lecky, 'was never more wonderful than when walking alone with one companion, for whom he certainly made no effort of display, whom indeed he seemed almost to forget. His conversation was mainly monologue and, in a greater degree than any other talker, soliloquy.' His very eloquence, overpowering and sweeping, must have been terrible at close quarters, and, indeed, punctuated that amusing criticism of him which John Stuart Blackie wrote to his wife in 1848: 'Yesterday I spent an evening with Thomas Carlyle. He is really a notable monster, and to be respected for the many noble thoughts he has elaborated and for the words of wisdom which he has flung abroad to bear divine fruit among foolish-hearted men; but I can't help thinking, face to face in a small parlour, he is rather terrible, and I fancy prophets are best exhibited in the pulpit or in the wilderness. A few grand moral instincts burn so intensely in the hearts of these men that they have no room for anything else; they rush out from their smoking sanctuary with a flaming sword in their hand, and whoever follows them not and fights is accounted a heretic. Scottish and English Universities, British Houses of Parliament, orthodox theologies, railroads, and free-trade were all shaken out and sifted under the category of sham; while Oliver Cromwell and his Ironsides and the old Covenanters who sang psalms and handled pikes on Dunse Moor were held up to admiration as the only heroes in this country for the last two hundred years.' John Stuart Blackie was, of course, the last man in the world to take Carlyle's 'gigantic one-sidedness,' as he describes it, lying down. 'I had an hour with stout old Carlyle, who is flashing about him in the same one-sided, magnificently unreasonable way that you know. Of course, I protested against that style of thing *in toto*, and ended by putting myself under the wing of Aristotle, who, if not a greater genius, is certainly a much wiser man than Carlyle.' At another time he wrote: 'After lunch I went by special desire to see Carlyle again, and found the shaggy old prophet exceedingly cheerful in his chronic despotism. He kept me two or three hours, rattling and slashing and splashing on in a perfect whirlpool of denunciations and negations. At last I jumped up, and, shaking him by the shoulder, cried, "You are the incarnation of the everlasting No."'

But in spite of this magnificent intolerance, this superb egoism and uncompromising tyranny of one-sidedness, both Blackie and Lecky could not but be impressed by the unique spectacle which Carlyle presented as one of the few great talkers of the century. Mr Lecky has drawn a picture of the Hero as Talker which, proceeding from such a source, must be taken as carefully considered and judiciously balanced, and he does not speak in the language of half-praise: 'Carlyle's conversation was certainly, of its kind, immeasurably the most beautiful, singular, and impressive I have ever known. One of its charms was a singularly musical voice, a voice particularly fitted for pathos, and this tone quite took away anything grotesque in the very strong Scotch accent. It also gave it a softness and a charm which is wanting in his writings. . . . It was never for an instant commonplace. The whole diction was always original and intensely vivid, and it was more saturated and interlaced with metaphor than any other conversation I have ever heard. It was a conversation which was peculiarly difficult to report, for it was not epigrammatic, but continuous, and very much of the charm lay in the extraordinary felicities of his expression, in the vividness of his epithets, in his unrivalled power of etching out a subject by a few words so as to make it stand in prominent relief. He was the very greatest of word-painters. . . . His conversation was not slow enough to be wearisome or to give any sense of effort, yet so fully and perfectly articulated that every sentence seemed to tell. It streamed out by the hour in a clear, low voice, glittering with metaphor and picturesque epithets and turns of phrases of the truest eloquence.'

Though, as we have indicated, the conversation of Carlyle was mostly monologue or soliloquy, yet it was always backed up by a power to meet his critical opponent with quickness and dexterity of argumentative repartee, a skill to find in a flash a weakness in his challenger's armour, and of warming to the fray under the interruption. 'Never was such a master of invective, welling and surging up in an irresistible geyser of opposition.' But his talk was not all fire and fury, not all thundering

against the walls with hot words and fiery syllable. 'He was also,' says Mr Lecky, 'the most pathetic of talkers; indeed, the only talker I have ever heard who was really pathetic. Pictures of his early life and of the sorrows of those he had known, or scenes from history, were related in a tone and with a manner that drew tears to the eyes. On religious matters his language had a sublimity and an air of inspiration which always reminded me of what a Hebrew prophet must have been; and sometimes, when very earnest, he had a solemnly strange way of turning and looking full in the hearer's face before speaking, which added extraordinarily to the impressiveness of what he said. I have never seen this in any one else, and it always reminds me of Luke xx. 17.'

Lady St Helier's pen-portraits of the author of *Sartor Resartus* are touched with grace, insight, and sympathy. 'The tall, attenuated figure, dressed in a loose wrapper, seated beside the fire smoking his long pipe, the fine head with its masses of gray hair, the stern face with its almost youthful colouring, his keen eyes with their expression of great sadness, his occasional grunt of acquiescence, or a violent outburst of opposition, as the conversation changed or varied, made up an impression ever associated with him.' 'He was either agreeable or argumentative, according to the condition of his health and the mood he was in. He was most often contradictory; but if he were allowed to continue his argument—or rather, I should say, deliver his opinions uncontradicted—he very often broke off at the end with a laugh, which was in a way apologetic for the duration of his discourse, to which we all had listened most patiently.' Lady St Helier tells us that in the matter of this volubility in monologue even Queen Victoria's claims to have a word in edgewise were not considered, for on being presented to Her Majesty, Carlyle squatted himself down without waiting to be asked, and rattled on in the same characteristic fashion with which he was accustomed to treat his friends. When a woman likens a man to one of her sex the similitude is worth repeating. 'Mr Carlyle's peculiarities,' says Lady St Helier, 'were very like those of a woman, for he was uncertain, irritable, and capricious; and while he tolerated many people who paid court to him, he regarded them from quite a different intellectual standpoint, and the short descriptions and nicknames with which he designated some of them were irresistibly funny and appropriate.'

It is interesting to observe in all those who are gigantically one-sided that, though they may be men of great erudition and wide reading, yet it is invariably found that there are gaps in their knowledge that one would not expect *a priori* to discover in the philosopher *per se*, the rôle assumed so brilliantly by Carlyle. 'His knowledge and memory were very great,' wrote Lecky, 'but of a peculiar kind, and his mind was like the electric light, which throws out both strong light and deep shadows. There were large tracts of subjects, well-known books, and large interests of which he was utterly ignorant, much more so than most educated men, and these were not always the subjects on which he was least dogmatic.' 'But,' added Lecky later, when he was pleading eloquently, but in vain, for some memorial to the passionate teacher, 'whatever diversity of opinion there may be about some of his teaching, there can be no reasonable doubt that he has been one of the three or four greatest men of letters of the reign of Victoria, that during a singularly honourable and laborious literary life he has been one of the great "seminal intellects" and perhaps the strongest moral force in English literature.' However Carlyle may have sinned in his teachings and methods, he sinned, as Blackie says, 'with the sin of great minds—that is, playing the despot with the grand idea. Great ideas are necessary to do great things in the world, but they can no more do such things alone than a paper plan by a Michelangelo can raise a dome of St Peter's without lime and stone.' Carlyle was, of all things, an honourable man, and, as has been said, a tremendous moral force, and it was this combination in his own personality that attracted him to the noble moral nature of John Stuart Blackie, of whom he wrote: 'A man of wide speculation and acquirement, very fearless, very kindly, without ill-humour, and without guile.'

The life of Thomas Carlyle had no golden sunset. As he weakened he fretted and craved for the release, but we are told that, as he sat alone by his fireside preparing to face the eternities, he said to Lecky, 'The two things I think of most are the stars and the little children.' And the last picture which Mr Lecky draws for us of the old prophet is infinitely pathetic: 'I used to dine with him regularly once a week, chiefly to light his pipe and lift to his lips a tonic which he had to take, as he could do neither himself, and he used to sink into long unbroken silences. He was still, however, able to take in a little reading, and just before his last illness I read to him some of Burns's letters, the last book, I think, he tried to read.'

# LAURISTONS.

## CHAPTER III.—HOW THE SAXES CAME INTO THE MATTER.

JERRY had manifested his native shrewdness when he closed his eyes to Miss Honeybun's advances, and chose instead Mrs Lauriston's woman, Hephzibah Mowatt.

Hepsy had been an under-maid at Craigielee when Mary Hamilton was born. When Mary developed into the beauty who turned the heads of all Edinburgh, old and young, soft and hard, Hepsy enjoyed her young mistress's triumph, as she enjoyed her confidence, to the full. When Mary Hamilton married Captain Lauriston—a love-match if ever there was one, for at that time Captain Charles was only second son, though the portion of even a second son of old Lauriston the banker was not to be despised—Hepsy went with her to London, and had never left her since.

And what Hepsy had been to her mistress, Jerry MacClootie had been to his master ever since he became his orderly in the American war. When George Lauriston died, and Charles perforce had to give up soldiering and take his place in the bank, Jerry and Hepsy cemented a long acquaintance with a closer relationship still, and Hepsy became Mrs MacClootie, in spite of the ill sound of the name.

She was a small, plain person, with the largest heart and the softest voice imaginable—a heart that overflowed with sympathy for every human being, except perhaps Miss Honeybun, for whom, despite many efforts, she had been quite unable to cultivate even a liking; a voice of such tender tones and inflections that it was at all times sheer delight to listen to it, while to hear it employed sympathetically on one's own behalf was like the pouring of balm on open wounds.

The children adored her. All the active part of their mothering had been hers, for after Mavie's birth Mrs Lauriston had had a long and trying illness; and her keen anxiety for her husband, who had accompanied the Duke of York on his unsuccessful expedition against Dunkirk, had militated against recovery and permanently affected her health. In all their childish troubles, then, the children had always sought Hepsy, and Hepsy never failed them. They would no more have thought of going to Aunt Charlotte for sympathy and assistance than of going to her maid Honeybun, with whom they waged open and perpetual warfare.

Neither Miss Lauriston nor Honeybun was exactly a sympathetic personage to young adventurers whose manifold activities were always leading them into scrapes, from which at times it took all Hepsy's gentle skill to deliver them unharmed. Not that their escapades were as a rule of a very sinister cast; but Miss Honeybun's one and only idea of discipline, derived from her own early experience, was the rod; and Aunt Charlotte's placid self-sufficiency sought only its own perpetuation on the lines of least resistance. If anything or anybody interfered with Aunt Charlotte's scheme of existence, her simple placid wish was for its removal and the cessation of its disturbance.

It was very shortly after the troubles of the year 1745 that George Lauriston transferred himself and his banking business to London, with one clear aim in view—the one clear aim attaching proverbially to his countrymen in their migrations to the South. He came to the Metropolis to get on, and in pursuance of that laudable and national ambition presently married Lady Jane Scarlett, only daughter and heiress of the personal estate of the lately deceased Earl of Rediton.

Lady Jane was some years older than her husband, and was possessed of many of the characteristics of the Scarlett family in addition to its wealth. In its own country the whole race was commonly accounted 'daft;' which expression, while conveying no definite implication of lack of brain-power, undoubtedly suggested doubts as to the proper utilisation of what it had. The family fortunes had notoriously been built up by successful marriages. Possibly Lady Jane recognised a fellow-feeling in George Lauriston, and was quite willing to assist his laudable ambitions. In any case, her money was useful. It was settled on herself and her issue, indeed, but it was in the bank, and Lauriston turned it to account. She bore him one daughter, Charlotte, and died, leaving him by no means inconsolable, and many steps up the golden ladder.

Lauriston's baronetcy was conferred on him by the king in 1758 for services of a financial character rendered to his allies in the Seven Years' War; and two years later he married again, this time regardless of his pocket, for he was now a wealthy man. Of this marriage he had issue two sons—George, who in due course took his place in the bank; and Charles, who chose a military career, saw service in America and the Low Countries, married Mary Hamilton of Craigielee, and became the father of our young friends Charles and Mavie.

Captain Lauriston's service, however, was brought to an abrupt termination by the sudden death of his brother George, which necessitated his filling the vacant place at the bank. Sir George, though wonderfully hale and hearty, was getting on in years, and had of late been aging somewhat rapidly. He was close on seventy-five, and there must be a Lauriston ready to take his place when his call came.

So Captain Charles sold out perforce, and to his

own great disappointment, just when the trend of events on the Continent seemed to hold out prospects of more than usually active service, and so of rapid advancement, for he was a general favourite, a man whom men would follow to the death, and who stood well at headquarters.

The one palliation of his regret was his wife's joy at having him safely with her at home. Her heart was bound up in him, and after the long illness which followed little Mavie's birth she had suffered agonies of separation and poignant fear while he was away on service with the Duke—fears which were justified, as it turned out, for the expedition ended disastrously, and Captain Charles's bones had rested in Dunkirk sands but for the devotion of his friend John Sax, who took the lance-thrust intended for his master, and died in Charles's arms after the latter had settled the lancer's account by cleaving him to the chin.

And that brings us to the Sax family.

The name of Sax was almost as much an institution at the bank as that of Lauriston itself. Old John Sax had taken service with George Lauriston when first he came up to London, and had served him from that day with a personal devotion that had known no limits, and a fidelity that all the money in the world could not have purchased. John Sax had simply lived in and for 'Lauriston's.' Many a time his wife had smilingly said that his life began with an L and ended with an N. And she was not far wrong. John Sax looked out on life from the windows of the bank. No event in the City, or in the world at large, but was considered by him in its bearing, direct or indirect, on 'Lauriston's,' and only from that point of view was it of consequence.

Lauriston had always been his own manager, and kept the reins in his own hands; but if he was the head of everything, John Sax was his right hand, trusted implicitly, and as fully conversant with all the ins and outs of the business as the chief himself. A man of consequence, therefore, and held in highest esteem throughout the City, and not only for his business acumen and his unswerving fidelity; he was known to be a man of blameless life, and a regular and devout church-goer in an age when such were none too common.

Twice every Sunday, wet or fine, he walked from his house in Queen Street, Westminster, through St James's Park, past the end of Carlton House, and up through Leicester Square and Crown Street, to Tottenham Court Road; and from the time he was six till he was turned eight, little Jack, his grandson, could have found the way blindfold, for every Sunday he trotted along by his grandfather's side and stood the preaching valiantly for the sake of the adventurous walk.

Mr Sax's pew in Whitefield's New Tabernacle had known him, since the day the place was opened, as intimately as the pulpit had known the great preacher himself, and Mr Whitefield's death had made no difference in John Sax's attendance, though he missed him sorely.

And he was charitable according to his means, visiting the sick and forlorn, and assisting as he was able, and all this without the slightest ostentation, rather under modest cover of an acceptance of such matters as simply right and proper and calling for no comment. His mother had been a Whitefieldite, and she had done great things for him.

Perhaps he was a trifle narrow in his views and overstrict in the enforcement of them, for his son —also John Sax, and the father of our little John, the sucker of possibly poisoned wounds—grew restive under the restraints of the bank, where he had a position as clerk, and of the strait-laced home, kicked over the traces, married into an unknown family, and when his wife died, leaving little John upon his hands, transferred the small burden to his father and mother, and enlisted.

It was a grievous sorrow to the old folks, but in due time the wound was roughly opened again by his death before Dunkirk, and salved and healed for ever by the manner of his dying.

Captain Charles, when he came home, went straight to the little house in Queen Street, and what he had to tell made them proud of their prodigal again, and wiped out all the past.

And, as Charlie said to old Jerry in the harness-room, with his arm round John Sax's neck, the Lauristons were never going to forget it.

*(To be continued.)*

## NOTES ON FLYING-FISH.

OST of us have heard the story of the sailor who described to his mother the wonderful things he had seen during his travels in the West Indies. She listened in credulous silence to his accounts of mountains of solid sugar and rivers of pure rum; but when he came to mention that he had seen fish with wings which flew through the air like birds she thought he was carrying things a trifle far. 'No, no,' she exclaimed. 'I can believe in your mountains of sugar and rivers of rum, but not in your flying-fish.' This old lady was by no means a solitary example of the saying that truth is stranger than fiction. The writer knows a lady who has made a return-journey from Europe to South America, passing twice through the entire breadth of the tropics, during which time she saw countless numbers of flying-fish. Yet to this day she scoffs at the idea that flying-fish exist. On their being pointed out to her on the trip,

she stoutly maintained that they were sea-birds, for which, indeed, they might easily be mistaken when seen at a little distance. Stranger still, she ate one of them, but even this failed to convince her. Unfortunately the wings had been cut off before it was brought to the table. Even the old saying that 'seeing is believing' does not always hold good.

Although flying-fish are common in the tropics, they occasionally stray as far north as the English Channel, and one was even killed a few years ago in the river Medway at Rochester. A man, noticing a fish leap from the water and fly along the surface, struck at it with his walking-stick, with the result that he was able to capture it. It proved to be a fine specimen of the *Exocœtus robustus*, measuring fifteen inches in length. This capture was effected after a long spell of hot weather, which had evidently betrayed the fish into swimming into strange water. (*Echo*, London, September 26, 1898.)

In travelling southward through the Atlantic Ocean, one may note occasional flying-fish in the latitude of the Canaries, or even farther northward, but it is usually only within the tropics that they are plentiful. In the Southern Hemisphere they seem to range to a higher latitude, and have been plentifully observed in latitude forty-five degrees south or thereabout, between Australia and New Zealand. The flying-fish found here is a different species, however, from that commonly observed in the North Atlantic, and more solitary in its habits, as it is generally to be seen flying singly, while its congener of the North Atlantic usually flies in shoals.

Flying-fish are fine eating, in taste somewhat resembling a herring. The writer has several times eaten them on board ship, and also on shore in the Canary Islands and in Barbados, in which latter island they frequently appear on the menu of local hotels. Mr Aflalo the naturalist has also tasted fried flying-fish in Barbados, and is enthusiastic in his praise of it. The West Indian negroes catch them at night by holding a light over the side of a boat. The light attracts them, and in flying towards it they are caught by nets spread out for the purpose, or even by the sail of the boat, against which they strike and then fall to the bottom, in which position they are quite helpless, for this fish, once it is stranded on any solid surface, is unable to rise; in fact, it becomes just as helpless as any other fish.

The theory that the flying-fish glides through the air like an aeroplane, propelled by the tail and guided by the pectoral fins (wings), is disproved by another naturalist, Lieutenant-Colonel C. D. Durnford. He finds that an average flight begins with a jump into the air, the fish being propelled by the tail and aided by the wing-like fins; that it is continued by a laboured and exceedingly rapid movement of the seemingly motionless wings (which at times slow down so that the vibration becomes visible); and that it ceases either with a sudden stoppage or gradual slowing down of the wings before the fish reaches the water.

There are many popular misconceptions regarding the flight of this fish. A number of people imagine that it can fly for a great distance or at a great height, like a bird, and the writer has seen an old print which represented them flying high above the masts of a vessel. This, of course, is altogether erroneous. The fish can only fly for a short distance, generally not more than fifty yards, and never rise more than a few feet above the water. Once the initial impetus is expended they are unable to continue their flight or to deviate in their course to any great extent, as is proved by the fact that they frequently fall on the decks of passing vessels.

The writer was once sleeping in his cabin, passing through the tropics, when he was awakened by a loud, fluttering noise, as of a bird struggling on the floor. Rising and striking a light, he found that it was a flying-fish which had entered through the open porthole and fallen to the floor. It was handed over to the ship's cook, and duly made its appearance on the breakfast-table next morning. Before it was handed to the cook the wings were cut off. One of these was much longer than the other. They were spread out, moistened, and mounted on cardboard, and were then posted to friends in England, to remove any lingering doubts as to the existence of flying-fish. The wings were of delicate, gauze-like texture, for all the world like those of a fly, except that they were six inches long. When not expanded in flight they closed automatically like a fan and pressed against the fish's side. These wings are simply an abnormal development of the pectoral fins, and the flight of the fish was probably evolved in the course of ages in its constant leaps out of the water to escape its foes, especially the dolphins or bonitoes which prey on it; though sometimes it appears to dart out of the water in mere exuberance of spirits, like troutlets leaping in a pool. It is a case of leaping out of the frying-pan into the fire, for in leaving the water to escape pursuing enemies the fish often fall victims to albatrosses and other birds which poise in wait for them in the upper element.

A Portland (Maine) sea-captain tells of his sailing in southern seas where flying-fish abound. They would sometimes in their flight during the night come aboard the ship and drop on the deck. He had three cats on board, and although apparently lying asleep below, they would hear the sound whenever a fish struck the deck, and rush up to get it. They distinguished this from all other sounds. The crew sometimes tried to imitate it in various ways, but could not deceive the felines.

Humboldt in his great work describes the flying-fish which he encountered during his trip to South America. They commenced to be numerous in latitude twenty-two degrees, or shortly after the tropics

were entered. He calculates the extreme height of their flight at eighteen feet, and mentions the enormous size of their natatory bladder, which in a fish of six and a half inches is three and a half inches long, three-quarters of an inch broad, and contains about three and a half cubic inches of air. As this bladder occupies more than half the body of the fish, it is probable that it contributes to its lightness. He also confirms the fact that the animal beats the air with its wings during its leap —that is, alternately extends and closes its pectoral fins. The cabin-boys amuse themselves by cutting off a part of the wings, and they assert that these grow afresh, like lizards' tails.

---

# THE FORGOTTEN ROCK.

## CHAPTER III.

**Marl'd seas, and a thousand isles.**

SUMMER races to Finland in a royal avalanche of colour and foliage.

Short weeks before, these plumed woodlands were cowering under snows, shrouded in a silence, tense and continuous, imaginably of Death: gray frozen ridges gripping the shores with callous manacles; out and beyond them the sea, impotent and deserted, a steel-blue, trackless floor of ice; the white beleaguered world lanterned fitfully, in a daunting antithesis, by haggard and half-hearted noons, by the splendid pallor, the unearthly searchlights of the Aurora Borealis.

But nearer sound the faint, far-off pipes of spring —still nearer. At the unheard melody the heart of the world beats quicker. Waiting instincts raise exultant heads. The days lengthen; the virgin snows are wrought in delicate traceries, in gossamer films of lace athwart the trees. There is a stirring of sap, a movement of tender life under the snows; bright eyes gleam; wild, shy calls are heard in the forest life. Here there is no approach on tiptoe, finger on lip, no gentle bourgeoning, as in the slow, sweet tide of an English spring. With triumphant swiftness land and sea awaken. Bright flowering heralds suddenly raise their daring pennants, crimson, blue, golden, to the sun. The trees blossom with the magic of Tannhäuser's staff. The passionate northern summer-god woos at white-heat, and the isles, transmuted, fly a joyous tricolour of silver and green and lilac—silver in the filigree of lakes, in glittering belts buckling together the woods; green in the forests down to their mirror's edge, splashed by great billows of shining lilac.

Here, in the heart of these nameless isles, the *Covesea* lay moored at a wharf, the apex of a little V-shaped bay, all around the crowding trees and tangles of undergrowth, rising upwards on gentle slopes to a couple of hundred feet. The riband of a cart-track, white and dusty in the sun, wound through the trees towards the quarry. Granite underlay the isle. Boulders of it pushed their great shoulders through the undergrowth. Of granite, too, was the crest, where, looking down, one saw the gracious vista of a hundred islands, a string of emeralds studding the white floor of the sea. A Swedish brigantine curtsied lazily at her moorings in the offing, the complexities of her spars and rigging picked out clean against a cloudless sky.

Huddled together near the wharf were a score or so of little boats, a few of them drawn up on the beach. They belonged to the islanders who had come to work at the loading of the *Covesea*. Some of the men rowed or sailed home in the evening. Others slept contentedly the sound sleep of labour, on spruce-branches, through the warm summer night. Gangs of workmen had sweated all day in the glare of the sun. There were pure Finlanders, with the high cheekbones and the hint of almond eyes, a suggestion of atavism from their misty Magyar forebears; big-featured Swedes, tall, fair-haired, blue-eyed, with frank, pleasant faces, and clear, wide, seagoing eyes begotten of life in the open and the looking into far distances, showing regular white teeth in their smiles and laughter; some of them wearing the pointed wooden Finnish shoes, all of them carrying the sheathed Finnish knife at their waists, and smoking the ubiquitous little light-brown cigarette. Snatches of Swedish, soft-vowelled Finnish, or Danish were tossed to and fro among them; more laughter than in an English or Scotch gang at the same hard work; terse orders now and then to the crew working the winch shouted by the mate in broad Morayshire; a careless bar or two of a song from a group of men and women waiting ashore.

For days the *Covesea* had trembled to the thud of huge granite blocks being lowered into her sturdy hold. The tumbled heaps on shore had grown gradually less; and but for the coming of Saint John's Eve the captain might have counted on having up anchor and heading south in another thirty-six hours. Flett, however, knew the North, and knew that no more work could be got out of the Finlanders on that day or the next, for Midsummer's Eve, in the full heart-beat of the northern summer, is their great festival.

As under the snows there lie forces of life hidden, aspiring, invincible, so under the surface-cold northern nature there beckons a gleaming Arcady of romance and imagination, a mystical undercurrent running through this virile, highly strung race, finding partial expression in old songs, old customs, the ghosts of thanksgivings for life handed down from the dead centuries. Wisely, the early Church conserved

the nature-worship woven into the heart of humanity, and the optimism of long-forgotten ages is still insistently voiced in eternal emotions older than laws, older than the faiths, as old as the ribs of the world. Wherefore mating-time and harvest, celebrated long ago in joyous rites, now honour Saint Valentine and Saint Barnabas. Chivalry, courage, purity, and kindred qualities are linked to other holy names, and with this northern people, cradled in dark winters, the jewelled virtue of gratitude, of thanks to the sun, the wonder-working summer god, is symbolised in festivals and merry-makings, in singing songs handed down by the runo-singers from lost centuries; in lighting the Kokko fires, the descendants of the ancient flames of Baal, first raised by groping pagans, and kindled to-day, such is the amazing irony of the years, by Christian peoples on the eve of the gentle Saint John.

All work is stopped for this holiday. Greenery adorns the Finlanders' world. The sacred birch-tree festoons the buildings, the town mansion-houses, the city streets crowded with shops, the little wooden cabins hidden away in lonely firths. The carriages and country carts are embowered in branches, and every mast round the coast and in the harbours shows birch-branches from the main-truck to the bowsprit. Sons and daughters from the towns, white-capped students from Helsingfors, sailors from their ships, hurry home for Midsummer's Day. Families reunite. Holiday-makers desert the towns, and laughter rings in the network of lakes, where all manner of *fêtes champêtres*, dancing, bathing, and yachting parties chase each other. The joy of being alive finds its apotheosis on Midsummer's Eve.

The skipper was standing watching the workmen putting on their coats. The growl of the chains and the rumble of the granite blocks had suddenly ceased. Round the point came racing a couple of boats rowed by Finnish girls, with shining flaxen hair, brightly coloured kerchiefs on their heads. They rowed well, even for Finland, where every man, woman, and child can row and swim. The little crowd shouted laughing encouragements to them as they neared the beach, and soon the girls were ashore, smiling and chattering. Then came hand-shaking and much merriment. They were there, these comely lasses, to help in the festivities, to see the bonfire lit on the crest, to watch the sports, to dance in the woods, to play the kantala, and sing their beloved songs of Finland.

'Joseph and Marie!' said one of them, her complexion like her native Finnish strawberries and cream, 'of all the days in the year this is the finest, Pervo! It is all arranged! We shall first picnic in the woods, and then—then to dance; ah, to dance till morning!'

'We shall all be ready in half-an-hour, Brita,' said the man addressed. 'Then we sail round to the west of the island.' He gave an order or two to the men, and the little crowd gladly dispersed, soon to return arrayed for the holiday.

'We'll get no work oot o' them for a day or twa,' said the skipper gloomily to the mate. 'They're neither to haud nor to bind when Midsummer's Eve comes roon'.'

'I doot no',' grunted the mate. 'Them and their capers wi' birk-branches an' sic-like. I wonder they canna tak' their holiday aboot the New Year time, like sensible folk.' He was thinking of the whisky and currant-buns of the sensible folk of his native land. No artistic fêtes for him.

'Canna be helped,' said the skipper. 'They work weel when they're at it, I'll say that for them;' and he waved a hand in response to a shouted goodbye from the last boat rounding the point.

Then he went below to write up his log. This done—the pen in his hand and the mood on him—he wrote to his wife, his one and only exercise in correspondence other than an occasional telegram to his owners. They had arrived all safe (under Providence), he said, and had fine weather, no illness on board (thanks be!), and everything going smooth alow and aloft, in a manner of speaking. He had been kept back by some holiday cantrips on the part of the men about there, but hoped to sail for London on the twenty-seventh. They would be spoken (if they were spared) at Lloyd's station at Elsinore, and reported, and she would no doubt see it in the *Aberdeen Journal*. He hoped she was well and the bairns were biddable. And any letters were to be sent to him at the Baltic Hotel. So no more at this time from her affectionate husband, Hugh Flett. There was a postscript that Mr Westwater was 'out from morning till night, and no doubt enjoying himself, though he is not a great talker; but he looks very tired when he comes back to the ship at night.' He also counselled her not to forget the sticks for the sweet-peas, and closed the letter hurriedly, as he felt inclined towards an expression of sentiment.

The steady afternoon sunshine was drinking the surface of the sea, and a faint heat-haze trembled in the distance, blurring the lines of the islands. Not a cat's-paw flawed the glass of the ocean. Not the faintest wash tinkled against the ship's sides. The flaming sword of the sun passed steadily overhead. Everything was hot to the touch. The decks sweated pitch in their seams and wrinkles. Two or three sea-birds stood as motionless as though carved out of their rocky perches. There was a tense silence abroad, stirred, hardly broken by the faint drums and pipes of the myriad insect life in the woods. The world was drowsy in the clutch of the sun.

Westwater was lying aft, in a deck-chair under an awning, muscles, limbs, and neck lax, in the sound sleep that comes to the tired in body. His deep, regular breathing was the only sound aboard. The captain was below wrinkling his brows over the ship's accounts, stumbling among differences between Finnish and English currency. Some of the crew were asleep forward, or ashore at the junketings, ignorant of the speech of the Finns

but proficient as their maidens in the Esperanto of the eyes, an ancient language, and one easily learned.

Westwater awoke, and stood up, throwing a swift, curious animal glance behind him. There was no one on deck. A dead hush hung over the ship. He had been dreaming. He yawned softly and stretched himself, a suggestion of a lithe, handsome cat in his pose. Then he looked at his watch and gave a look around. It was between three and four o'clock. He lifted his gun and a knapsack lying near, and walked lightly, quickly across the gangway ashore, where, just at the outskirts of the wood, the second-mate was coming back to the ship in a leisurely saunter.

"Afternoon, Scott!' said Westwater. 'If you're going aboard will you tell the captain that I'm off again on one of my expeditions? Like the man in the song, I won't be home till morning.'

'Very good, sir,' said the second-mate. 'Are ye gettin' many speciments, sir?' indicating the knapsack with a nod.

'Oh, geological? Yes. I'm nearly satisfied,' replied the other, and waved him good-afternoon as he disappeared among the trees.

Westwater's way lay for a couple of miles across the isle through the woods. The heat had lessened, and in the colonnade of pines there was a welcome shade. He walked with hungry strides suggestive to any one watching him closely of either the pursued or the pursuing, and soon emerged on the other side of the isle at the edge of a tiny creek, where a small sailing-boat was pulled up on the shore. He looked round with the same animal swiftness, took off his blue spectacles, launched the boat, and got in. He took the oars, for there was not enough wind to set thistledown a-sailing. He rowed steadily for an hour well within himself, without haste, without rest, until a cat's-paw of wind ruffled the dead calm. Then he ran up the sail.

A puff of wind came, then another. The sail began to draw as he unshipped the oars and took the tiller, steering with a practised hand. The boat slid along, a swift panorama of islands unrolling, some green and inviting, with brisk, moving human figures, the resonance of voices from them carrying over the waters; others mere brown, dripping rocks, bald-crowned, edged with gray incrustations where the water lapped and rustled. The boat and its solitary occupant passed them, heading for a brown blot, leagues clear of the labyrinth of isles. Westwater scanned the mark again and again through his binocular, never taking his eyes off it in the intervals.

The brown blot stood alone, an outpost. As the man in the boat drew nearer, its blurred lineaments hardened into definiteness. Its height, greater than that of the other islets, gained by its aloofness from the little archipelago that it sentinelled. A grim sea-wall a hundred and fifty feet high, straight, insurmountable, ran for three-quarters of its circumference. On the side nearest the boat terraces of rocks rose gradually from a strip of wholesome-looking shingle to the crest, fringed by forlorn trees, where they stopped suddenly at the edge of a deep chasm five or six yards wide, its jaws narrowing like a wedge at the bottom. It was as though some titanic axe had nearly cleft the island in twain. Its configuration offered a dozen random similitudes to the beholder: a great stricken ship settling down by the head; the letter **M** badly set up; the tips of a drowning giant's fingers; most of all, and heightened by the hog-mane of dwarf trees that prolonged their uneasy climb to the edge of the cleft, that of the head of a sinking, gaping sea-monster. This was the isle called by the Finlanders the Forgotten Rock.

Here and there stunted birches clung gallantly to dizzy footholds; dishevelled alders sulked in damp corners; crouching granite blocks met the sea's dull splash. One glance told the spectator, shouted to him, that this was no human habitation. Indeed, to the eye there seemed scarcely a living for a wild goat on its desolate sides. It was roadless, naked, empty; no quick life visible, save in the snowdrifts of multitudes of sea-fowl on its stark cliffs; the isle vocal only in their scared gabble as the boat drew near, and they rose bleating in aimless convolutions, like wind-thrown spume against the dark sea-wall, or hovered high up, tattered smoke-clouds in the light airs. The isle stood solitary as a sentry. With the empty expanse of sea stretching away behind it and the other isles neighbouring each other in clusters fifteen miles distant, it mutely suggested a sense of loneliness, even of ostracism, vague and indescribable in its silence, in its broken lines, in its complete and surprising isolation.

The boat skimmed nearer to within fifty yards of the shingle. Then she was put twice slowly round the isle, Westwater steadily spying through the glass. This done, he headed for the shore, lowered the sail, and pulled cautiously down a rock-bordered avenue, the rowlocks clanking a loud monotony in the solitude. Rounding a bend, the keel grated on the shingle of a cove hidden by a curtain of rock. He stood up in the stern for a moment, listening, a secrecy in the poise of his head incongruous in the enveloping solitude. Then he jumped out, moored the boat, and, crouching behind a rock, swept the sea with his binocular. The only sails were far, far out in the fairway. Westwater slung the knapsack over his shoulder, took up the gun, and started off, subdued excitement in his eye, in his touch of heightened colour.

He walked silently, with a vigilant eye, along the tumbled rocks fringing the shore for half-an-hour, came back to the creek, and took up a coil of thick rope lying in the bows of the boat. Striking inland, walking in a narrowing circle, he came to the edge of the mane of trees running up the humped ridge to the summit. He looked round again. Manifestly he was alone on the rock. No

living soul was there. He stepped into the narrow wood, and faced the climb.

There was no pathway. The rocks were smooth and slippery, and he ascended slowly, with infinite difficulty, sometimes on his hands and knees over the more difficult stretches. The gun and coil of rope impeded him when a straight wall of rock had to be clambered over or circumvented; but he was making headway, every now and then pausing for a breath and giving a cast of his swift animal glance sideways and behind. In the intermissions of the little wood he went quickly, choosing soft footholds, his steps falling as stealthily as a panther's paws. At last he came out on a ledge some fifty yards below the crest. He looked up at it, and rapped out a sudden oath, staring, pale with anger, at a mound of cut wood and undergrowth piled up near it. Frowning and cursing, he came forward and examined it. It was a bonfire ready to be lit, a tar-barrel perched clumsily on its top—palpably some of the islanders' work. He looked at his watch. It was close on half-past six, and (he remembered) Midsummer's Eve. They might—they would—soon return to light it. They might be on the way now. He must hurry. He ranged the sea again feverishly with the glass and drew a breath of relief. Even assuming that any of the craft were heading for the isle, there was nothing within a couple of hours' sail of him. He might light the bonfire himself after—afterwards. It would be a good joke. Yes. He smiled, and climbed up to the edge of the cleft, hesitated a moment, and then lay down and peered over, his heart beating, staring intently down into the cleft for a minute or two into the semi-darkness below. He shifted his position along the ridge a dozen times, straining his eyes into the depths. Nothing!

Suddenly he stood up. He was very pale, and wiped a clammy forehead with a trembling hand. He lay down again. Something! Far down he caught a glimpse of a dull, whitish streak. It might be a shrub; it might be a sea-bird's nest. It might be—— He jumped up, and carried the rope towards a stout little pine near the edge, tied a stone to one end, and fastened the other securely round the tree-trunk. He lowered the stone over the edge, the rope running out rapidly and stopping with a jerk. He pulled it up a few yards, and heard its faint knock far down as it touched the bottom again. Then he tested the tree by a heavy haul on the rope. The stout pine-trunk never gave a tremor.

'All right! But I wish this wasn't a one man job!' he muttered, as he swung himself clear over the edge.

A piece of rock on the ledge loosened just a hair's-breadth under the rope's pressure, and slowly, inquisitively, craned over an inch or two as he disappeared. He went down steadily, using his feet against the uneven face of the rock. A couple of rock-pigeons flew out close to his head, and he gave a momentary startled clutch to the rope as he ducked.

Under the sudden jerk of the rope, the craning rock at the ledge moved another two or three inches over, and looked at him.

At last he reached the bottom. He braced himself for an instant and looked down, with a catch in his breath, for there, close to him, at his shaking knee, was what he had come so far to see, the skeleton of a man. The thing sat, its bleached head and spine against the face of the rock, its long arms thrown open—it seemed to the trembling living man beside it—in a mocking attitude of welcome, its jaws set in a dreadful travesty of a smile, a few wisps of faded blue rags still hanging round it, and the rotting, rat-gnawed remains of a pair of shoes at its feet.

Westwater looked at it. 'Dick!' he said in a crackling whisper.

His eyes were drawn to its blank sockets. In the half-light it almost seemed a commonplace living thing, with an easy gibe on its lips, and even as he looked it moved slowly, very slowly, leaning towards him, with a scrape and a rattle of its ribs on the rock. The cause was simple. His weight had shaken the ground and the bones with it, yet at the thing's uncanny lurch his hair literally rose, and he sprang back hastily. He recovered himself, after a shudder, and tried to look past the daunting sockets. But, seek to avoid them as he might, the hollow counterfeits followed him. He shut his eyes and still he saw them. When he opened them, there they were, staring at him, over the dreadful confident smile. It seemed to say to him, 'Look! Some day you shall be even as I am.' He hesitated, then suddenly flung his handkerchief over its face. Ah, that was better!

He breathed more freely. He was alone now. Bending down, he seized with a shaking hand the belt that hung limply round the ribs. The rotten strap came away easily, and with feverish haste he ran his fingers along the belt. There was something there, something he had come so far to touch. He seemed about to open it. No. He would wait till he got to daylight, away from the neighbourhood of the thing that had once been Dick.

The peering, inquisitive rock upon the ledge above craned over still another couple of inches.

Westwater straightened himself, took out an oil-skin belt from his pocket, thrust the other one inside it, tied it up securely, and buckled it round his waist. He looked down at his feet once again.

'Good-bye, old man! I must hurry. Good-bye!' he said softly. He put out his hand to remove the handkerchief, hesitated, and left it over the eyes and the dreadful smile, then seized the rope, and, hand over hand, using his foot's leverage now and then on the rock's projections, climbed slowly upwards. Near the top, where a merry evening wind was beginning to sing, and the bright world awaited him, he paused for a moment resting on one foot, felt the belt around him, and looked up at the

riband of sky above him. 'At last!' he whispered, and, even as he spoke, Destiny knocked at the door. His foot slipped on a stone. He swung in the air for an instant, then steadied himself, sending a quiver up the rope to the craning rock on the ledge overhead. A warning pebble struck his arm. He gave one swift, hopeless glance upwards at the careening rock, and almost on the instant it crashed down on his head, man and stone striking the wall of the cleft as they fell together.

There was a faint, muffled sound. The rope swayed; trembled; hung inert. An echo of crashing stones and a single cry, humming for an instant along the funnel of the rock, trailed off into silence.

*(To be continued.)*

# THE PHILOSOPHY OF DIGESTION.

'Is life worth living?' 'That depends on the liver.' The quip is too well worn to require amplification. The philosophy of the Western world, closely bound up as it is with bodily well-being, cannot dissociate the spiritual from the fleshly needs. It is otherwise in the East, where existence is regarded as the greatest misfortune, and the flesh a thing to be borne with patience. The Western life is too strenuous to admit of the gentle pessimism of the East. We have to live, and in the narrow compass of our lives we strive to include as many agreeable sensations as possible. The ascetic and the dreamer are regarded askance, or pushed aside to make way for the man of affairs. The vegetarian is scoffed at as a faddist; the temperance agitator is tolerated as a reformer who is striving to rid society of the drones of drink and the wastrels of the whisky-bottle.

Respectability, with a very big 'R,' is the highest aim of our civilisation, and we do not stop to think whether it is gained at the expense of happiness or no. If we give a thought to happiness at all, it is simply with regard to the bodily capacity of this or that individual for the enjoyment of his earthly prosperity. We commiserate with the millionaire whose health has broken down in his strenuous efforts to secure an undue proportion of this world's goods; but we pass by unnoticed the humble son of the soil who sings contentedly at his labour on a wage of eighteen shillings a week. Yet if we took the trouble to analyse the feelings of both we might learn something of the vanity of riches and the blessings of a good digestion.

Of the abnormal influence which the body exercises over our mental condition, let any one who chances to awake in the early hours of the morning judge for himself by the cold light of day. The letter of trivial importance left unanswered loomed as a vast dereliction of duty; the petty annoyances of the day before assumed proportions altogether out of keeping with their true significance; the word spoken in haste rose up to condemn; the lapse of some simple duty in the daily round took the aspect of a breach of faith. In the broad light of day we laugh at the mental exaggerations of the pitiless dawn, and attribute them, rightly enough, to the low vitality of the body; and we are not ashamed to do so, though thereby we confess to the domination of the flesh.

Being above all things a practical people, we set ourselves to discover how to obviate, as far as possible, the discomforts which the sustenance of the body imposes. We recognise that the laws of cause and effect operate with unerring precision in matters dietary, and we learn by experience what things to avoid and what may be safely assimilated; and if we cannot discover these internal truths for ourselves, there are scientific men at hand who are prepared to instruct us. They have compiled tables of comparative digestibility, headed by boiled tripe and grilled venison—delicacies which can be digested within the hour—and continuing throughout the entire range of edibles consumed by the omnivorous human race down to old salted beef, jam, crabs, and alcohol, which are beyond the six hours' time-limit.

The perusal of such a table is instructive and not without interest. It will be seen that cooking affects our food in various ways; generally speaking, by softening the texture and producing chemical changes, it renders the food more digestible, but there are exceptions where cooking prolongs the period of digestion. There are few things more easily digested than a raw whipped egg; but when it is hard-boiled four hours are necessary for digestion. On the other hand, milk is rendered more digestible by boiling, and a baked apple shares the honours with tripe and venison at the head of the list.

Bread, the staple food of a vast proportion of the Western world, is by no means easily assimilated in a new state. It is timed at three and a half hours. There are people who tell us that wholemeal and brown bread are more easily digested; and there are others to warn us that they produce deleterious effects on the stomach, and are less nourishing in consequence. The preference for one kind of bread over another would seem to be largely a question of individual constitution.

Fish, excluding eels and shellfish, is very easily digested when boiled, but less so when fried. An hour and a half disposes of the former, three hours of the latter. A century or two ago it was not so popular in Scotland as it is now, and the reason is not far to seek. There were no nets at the mouths of the rivers, and salmon were plentiful and easily captured in the upper reaches. Salmon-fishing in

those days was not regarded as exclusively the luxury of the rich. The salmon in the river belonged to the laird, and were a valuable source of food-supply to his dependants. There are in existence agreements in writing between masters and servants in which it is stipulated that the latter are not to be fed on salmon oftener than twice a week! So in some parts of England salmon used to prove tiresome in the seventeenth century. Selden in his *Table Talk* records that servants taken 'into that part of England where salmon is plenty' soon grow weary of it and wish for beef again.

It may be a source of comfort to parents at Christmas-time and the New Year to know that both turkeys and geese are easily digested—much more so than the commonplace fowl of the barn-door type. Whilst two and a half hours account for the roasted goose or turkey, the 'fowl'—even when called by the more euphemistic name of 'chicken'—treated in the same way will sit heavy upon us for four hours.

Beef and mutton stand much on the same mark as regards digestibility—three to three and a half hours, according to the cut and mode of preparation, with a warning against old salted beef, as already mentioned. Roasted or grilled, the flesh of the calf will remain unabsorbed for five hours, and fat pork for five and a quarter, though the latter becomes more amenable to digestion when salted or smoked. That 'bag of mystery' the sausage lingers between three and a half and five hours, according to its unguaranteed analysis and culinary treatment.

Of vegetables, asparagus and boiled celery are among the most digestible, requiring only an hour and a half for the process. Potatoes and beans take an hour longer, and onions and uncooked salad yet another hour or so.

Game is all classed together and reckoned at four hours and a quarter; but pigeon is not mentioned in the list. There would seem to be conflicting opinions as to the digestibility of this bird. On the one hand, it is sometimes recommended to invalids as a tasty morsel, when more formidable diet is forbidden; on the other, there is the story of the wager laid that a man would not eat fourteen pigeons in as many days. The bet was taken, and the man who was prepared to back his digestion against the bird began his diet of one pigeon daily. He was forced to abandon it in a week, the accumulation of undigested pigeon in his stomach making it impossible to continue.

The perusal of this table of comparative digestibility gives pause for thought beyond the scope of its purely material interest. The time-table for the stomach is an innovation which was unknown to our ancestors, and has only become necessary owing to the impaired physical condition of the race. It appears that we have to pay highly, perhaps too highly, for our ultra-civilisation. The development of the mental faculties and the arts of peace has been accompanied by a steady physical deterioration. In stature we may be superior to the knights of the Middle Ages—it is a fact that the average modern man cannot get into the armour of the fourteenth and fifteenth centuries; but it is equally true of the average modern man that he could not wield the great two-handed swords of his ancestors, nor support throughout the livelong day the weight of the armour which is too small for his bulkier limbs. We have only to look at the teeth of the African savage and compare them with the lamentable stumps of decayed ivory which do duty as grinders in our own country to realise the necessity for tables of comparative digestibility, peptonised foods, dental surgeons, wholesale druggists, and a host of modern innovations undreamt of by our worthy ancestors, for whom the barber and chirurgeon performed all that was necessary for soundness in tooth and limb. We profess to be appalled at the feats of gluttony recorded of men of gastronomic mark a few generations ago. We read with disgust how this or that man sat down to a meal of a sirloin of beef or a quarter of mutton and did not rise from the table until it was finished. But is not our disgust tempered with envy? Who in these dyspeptic days would dream of such a carnivorous orgy or hope to survive it? We blame the 'two bottle' men for many of our bodily discomforts and defects. It is convenient to make scapegoats of our ancestors for the indignity of a bald head or an emblazoned visage; but we ignore the judgment which posterity will pass upon us. A toothless and anæmic generation will rise up and condemn us for our tables of comparative digestibility, our peptonised foods, our digestive tablets, and all the artificial aids by which we seek to bolster up our failing constitutions.

The fact is that the farther we depart from nature and the more we lean upon science the more hopeless our case becomes physically. Modern discoveries are rapidly usurping the prerogatives of our bodily functions. The more advanced men of science are for abolishing with the knife those organs of our anatomy which have become or are becoming atrophied from disuse; they are for simplifying the mechanism of the human body by a process of attrition which in time will reduce its internal organism to the level of an oyster's or a star-fish's. Meanwhile we are in a transition stage, and our digestive system, no longer able to cope with the strenuous fare of our ancestors, is compelled to fall back upon science for relief. Hence these tables of comparative digestibility.

# CAPTAIN REYNIER OF THE VOLTIGEURS.

By W. D. Gray.

IT was, I suppose, between ten and eleven at night. I sat upon a truss of straw by a small bivouac-fire, wrapped up in my cloak, for this first day of December 1805 had been incredibly cold. All around, in every direction, the lights of hundreds of other fires shone strongly in the darkness. And about thirty yards away I could see the black, recumbent figure of the man who had insulted me. He lay there, taking his ease and joking with some officers of the Hussars who were visiting our camping-ground. This smooth-faced scoundrel had called me coward —I who had been fighting when he was in his cradle, who had carried a musket at Valmy, who had been made sergeant in the Italian campaign, lieutenant in Egypt, and captain after Marengo. And this fellow of four years' service had jeered at me, had mocked me, had doubted my courage. I had flung myself upon him, and if three of our officers had not torn us apart I believe I should have killed him. But my colonel had reminded us of the Emperor's orders, that any officer convicted of duelling during the campaign would be court-martialled and shot. 'You will obey those orders,' said the good colonel. 'Afterwards, when we return to France, it is another matter.' I remembered his words as I sat there in the firelight. 'Yes,' I said to myself, 'if you live after to-morrow's battle, my good Morlaine, you have still to face me. You laugh over there with your friends, but you may find me more dangerous than the Russians.'

I was still thinking of all this, my eyes fixed upon my enemy, when there came a sudden stir and movement from the grenadiers at the neighbouring bivouac. Men started up and waved their arms, bearskins rose upon the musket-barrels, I heard loud shouts and acclamations, and then there strode into the light our little man in the gray coat, whom I had first seen at Lodi directing the artillery. I sprang to my feet, and snatching up some straw, twisted it into a torch and thrust it in the fire. 'Voltigeurs,' I cried, 'salute your Emperor!' Instantly the hundred men of my company followed my example, some of them lighting two torches. The rest of the regiment took it up, then the brigade, the division, and finally the whole army. The enemy, looking down from their positions, must have seen an amazing spectacle. On every side the lines of fire sprang up from eighty thousand torch-bearers; from all around rose the great roar, '*Vive l'Empereur!*' the drums beat; the trumpets sounded. The Emperor passed through our camp smiling and saluting, followed by his staff. As he reached his quarters the illumination died down, the cheering ceased, and the men returned to their shelters. The whole affair had not lasted five minutes, but that night before Austerlitz is a thing never to be forgotten. For my part, I rolled myself up in my cloak and lay down again on the straw. I forgot Morlaine in thinking of the Emperor. After all, did it greatly matter that this young fool had spoken ill of me? The Emperor, I said to myself, knows me better. He knows whether his old servant, who has served him since the beginning, is a coward. All the same, I swore that Morlaine should answer for his words. We had quarrelled that morning about the veriest trifle, but I had always disliked the man. Something about him set me on edge; there was something wrong with him, something about his features and the look of his black eyes which made me distrust him. But for the present I forgot him, and was still thinking of the Emperor and the morrow's battle when I fell asleep.

We were all aroused in the gray dawn by the trumpets sounding the réveille. It was bitter cold, and a thick fog hung over the ground like a pall, but the men sprang up briskly from their bivouacs, and prepared for the great battle which we knew was coming. My regiment, the Fifty-seventh of the line, belonged to Drouot's division, and we were in reserve behind Soult and Bernadotte. We stood to our arms as the light strengthened. The fog was as thick as ever. It was very strange to stare into the thickness and hear men marching on either side and yet see nothing. Presently, however, it grew less dense and began to break apart, until the sun struck through it and seemed to drink it up. And then what a sight! There stood our whole army, the thick lines of blue and white and gold, the thousands of sabres and bayonets glittering, the breastplates of the cuirassiers blazing like great mirrors, the cannon sparkling and glowing as though on fire. And what men they were that the sun of Austerlitz shone down upon! The product of ten years of campaigning, young and eager, yet most of them veterans in warfare, with the greatest General in the world to set them in their places! As I stood there by my Voltigeurs, for all my lined face and grizzled moustache, I waved my sword in the air and shouted like the youngest sub-lieutenant.

As to the battle itself, we were, as I said, in reserve, and did not really come into action until the thing was decided. But we could see our comrades in the centre attacking the Pratzenburg Hill, and hear the terrible combat on the right where Davoût was holding back the Austrians. They defended themselves well, those Russians and Austrians, there is no denying that. Nearly opposite to us, on the slope of the hill, was the Russian Imperial Guard, gigantic men with great red plumes upstanding from their shakos. They fought like heroes, flinging

back Oudinot's grenadiers and then scattering the light cavalry. The noise was tremendous, and in the clouds of smoke and dust we could not see what was happening. But at last the Emperor let loose upon them the heavy cavalry of the Guard under General Bessières. They thundered by us upon their black horses, the picked men of eighty thousand, the fine flower of a glorious army. They finished the work, for the Russians gave way before them in all directions, and the allied army was split in two.

Now came our turn; and, my faith! it was time. Our division advanced upon Kutusoff's shattered columns. We ran forward all together, the hundreds of feet pattering upon the frozen ground, the bayonets gleaming in the sunlight, the men shouting, the drums beating the charge. The Fifty-seventh was on the right, in column of companies; in front was a Russian battalion striving bravely to stand its ground and cross bayonets with us. But I could see that they had had enough. Their ranks were ragged and uneven, and the ground behind them was thick with their stragglers. We went into them with a cheer, and almost instantly our leading companies were all mingled together in one furious mass. Suddenly, just near by, I noticed Morlaine, pale and evil-looking, pointing forward with his sword. I sprang before him, thinking to show him whether I was a coward or no. A few yards away I saw a tall Russian officer holding up the flag of his regiment and trying to rally his beaten men round it. I sprang at him, my sword in my hand. He saw me coming, and in his turn rushed at me like a bull. *Parbleu!* that was a fight. We stamped round each other, thrusting and slashing, tripping over the dead and wounded. He was a strong fencer, this young Russian, though the flag hampered him. At last I got past his guard and my sword was through him. He pitched over upon his back, dropping the standard as he fell. I snatched it up and waved it in the air. '*Vive l'Empereur!*' I cried triumphantly; '*Vive l'Empereur!*' And then, as I stood there with the flag in my hand, a pistol-ball fired from behind hit me in the shoulder, and with a thud I fell forward on my knees.

For a few moments I knelt there almost unconscious. The pain was sharp and agonising, but it was the knowledge that I must have been fired upon by one of our men which made my brain reel and the slope of the hill sway up and down like the waves of the sea. Meanwhile the regiment was rushing past me in pursuit of the Russians, who were now thoroughly beaten. The air was full of shrieks and cries, the loud reports of muskets, and the dull sound of blows. But presently, as they still pressed the enemy back, I was left alone. I struggled to rise to my feet, but, tripping over the flag-pole, fell down again, the blood pulsing from my wound. Suddenly an officer disengaged himself from the ranks of our men and ran back to me. It was Morlaine, and when I saw him I knew instinctively that it was he who had shot me down. As is the case with some few men, the hand-to-hand fighting had turned him into a devil. His face was deathly pale, his eyes burned in his head, and his lips were twitching. I tried to gain my feet again, but he thrust me back savagely.

'You are here, then?' he snarled, showing his teeth. 'I thought you were finished with. Give me that flag, you dog!'

'You villain!' I gasped. 'You miserable villain! It was you who shot me!'

'Was it?' he said with a laugh. 'Well, you had better give me that flag unless you wish to die once and for all.'

I looked anxiously about me to see if any help was at hand. The regiment was now some way off, and all around were none but the dead and wounded and the litter of the fight. But behind, at a little distance, I saw a small body of horsemen who were approaching at a quick trot. Morlaine saw them too, and with an oath snatched at the flag. I tried to keep hold of it, but I was so weak from loss of blood that he twisted it from me as if I were a child.

'You understand,' he cried mockingly as he ran to regain the regiment, 'I took this in the charge?' As I understood his meaning, with a supreme effort I staggered to my feet and walked forward a few paces. But it was no good. The whole field of battle went round me in a great circle, the noise of the fighting seemed to increase a hundredfold, and with a groan I fell, swooning, upon my face. Just before I became unconscious I heard the noise of horses' hoofs from the party of riders I had seen in the rear, and looking feebly up, I saw, as in a vision, the Emperor ride past, followed by his staff. It seemed as though he gazed in my direction and motioned with his hand. But at that there came a great roaring in my ears, everything went black, and I fainted away.

I cannot say clearly when I regained consciousness. There was a curious half-stage when I seemed to know what was happening, and yet was unable to see anything. It was then that I felt myself raised up by two men and carried carefully down the slope. Afterwards I felt myself being placed on a stretcher and taken a long distance over level ground. When my bearers set me down suddenly I must have swooned again, for I remembered nothing until I opened my eyes and found myself lying on some straw in a hut in Austerlitz, with the setting sun streaming through the little window. Another wounded officer was lying near by, and an army surgeon was bending over me, holding a flask of brandy to my lips. Afterwards he dressed my wound, which was more painful than serious, though he told me it would prevent me from using my left arm for some weeks. When he had attended to the other officer he left us in a great hurry, saying that with fifteen thousand wounded in the two armies he could spare us no more time.

Ah, that terrible night! It was not that the hut was very cold, that my companion talked to himself

in his broken slumber, that my wound burned and throbbed. It was the thought of Morlaine and his horrible treachery. It was the knowledge that he would reap the credit while I lay helpless, that I should be sent away to hospital, that no one would believe me when I returned to the regiment and tried to tell the truth. For I imagined that no one in the terrific confusion of the fighting had seen me actually take the standard; and who, I asked myself, had seen him tear it from my grasp while I lay there helpless? I wept with despair at the thought of it all—I, Louis Reynier, the man of eleven campaigns. At last, between two and three in the morning, I fell into a troubled sleep.

When I awoke it was full day and still extremely cold. The officer who had been lying near me was gone. He had been taken away in the early morning, and I never knew his name or whether he lived or died. The same surgeon who had attended to me before was standing in the doorway of the hut looking at me. When he saw my eyes open he came forward and dressed my wound again, afterwards ordering some food to be brought in.

'Well, captain,' he said when I had eaten, 'how do you feel this morning? Better, I hope?'

'Yes, monsieur,' I answered, 'thank you, I feel better.'

'That is good,' he said; 'but do you feel stronger? Do you think you could walk?'

'Why, yes, if it is necessary,' I replied, a little irritably. 'Thousand thunders! this scratch is nothing; it is not the first wound I have received.'

'I suppose not,' he said with a laugh. 'But as you feel so well, I can let you obey the Emperor's orders without fear of the consequences.'

'The Emperor's orders!' I cried, thunder-struck.

'Why, yes, captain. He has sent for you. His officer is waiting to conduct you to headquarters.'

As he spoke a tall, young lieutenant with a light moustache came into the room. I rose painfully to my feet and saluted him.

'Monsieur,' I said eagerly, 'is it true? Does the Emperor wish to see me?'

'Certainly,' he said—'that is, if you are Captain Reynier of the Fifty-seventh of the line.'

'Yes, I am he,' I answered, overwhelmed.

'Then it is quite right. Come with me, monsieur; and take my arm, for you appear weak.'

I was glad to do as he asked, for I did indeed feel weak and unnerved. We stepped into the open air, and he supported me slowly up the village street. The place was full of supply-wagons and men of the military train, and I saw long columns of Russian and Austrian prisoners being marched away under escort. But I took little notice of all the movement. I was thinking over this summons from the Emperor. Was it possible that he knew what I had done and what I had suffered? I remembered how he had seemed to come riding by just before I fainted.

'Do you know,' I asked my companion in a trembling voice, 'why the Emperor wishes to see me?'

'Yes, I know,' he said; 'but I am sorry I cannot tell you. I was ordered to say nothing if you questioned me.'

'You cannot tell me!' I repeated. 'Do you mean, monsieur, that the Emperor is angry with me?'

He broke into a laugh. 'Angry!' he cried. '*Parbleu!* the Emperor is not angry with *you*. I may say so much as that I think you are a very fortunate man, and I would give a good deal to be in your position.'

My heart beat quickly. It seemed, then, the Emperor knew something of what had occurred. But how *much* did he know? If he knew a little, would he believe the whole story if I could tell it to him?

'He has his headquarters at the old castle in the village here,' resumed the lieutenant. 'We shall be there in a moment. That was a great day yesterday, captain, was it not? I never saw such a battle. We have taken twenty thousand prisoners, a hundred and fifty cannon, a score of standards'——

'Standards!' I interrupted in a quavering voice. 'I—I took a standard yesterday, monsieur!'

He looked at me keenly. 'Ah, yes,' he said slowly; 'to be sure, to be sure. But here we are, captain. Keep hold of my arm, I beg.'

We passed through a door leading to a dark passage, which suddenly opened out into a large hall with a very lofty roof. A great circle of officers in brilliant uniforms stood around the walls, and in the centre, dominating them all, I saw the Emperor. He was talking to an old sergeant who stood at attention before him. He did not seem to notice our entrance. My companion twitched my sleeve and motioned me to remain where I was, behind two officers of the personal staff.

'You are to stay hidden for the present,' he whispered, 'and not to show yourself. The Emperor will call your name when he wishes to see you.'

I stood there in my soiled uniform, my wounded shoulder aching and my head in a whirl. I heard a number of names being called out one after the other, and saw men of all ranks step up to the Emperor. He would ask the length of their service, speak a few words of praise, and then decorate them or promote them. It was evident that he was conferring rewards for brave deeds performed in the battle.

All at once I heard an officer call out, 'Captain Morlaine!'

I started violently, and only saved myself from falling by clutching at the wall. My enemy came forward, his face calm, his bearing erect and confident.

'Captain Morlaine,' said the Emperor in a loud voice, 'I am told that you captured a Russian standard yesterday during the charge of Drouot's division. Is that so?'

'Yes, sire,' answered Morlaine.

The Emperor looked at him with a strange smile. 'Yours was a gallant act,' he said. 'It shall be suitably rewarded.'

He turned round in my direction. 'Captain Reynier,' he cried sharply.

I sprang between the two officers in front of me and saluted. Morlaine started back, and I heard him draw in his breath with a hiss. Napoleon looked at me with those wonderful eyes which seemed to search into your very soul.

'You command the Voltigeur company of the Fifty-seventh Regiment?' he said.

'Yes, sire,' I replied in a weak voice.

'I believe you also took a Russian standard yesterday?'

'Yes, sire.'

'And where is it?' asked the Emperor.

'It was taken from me, sire.'

'By whom?'

'By Captain Morlaine, sire. He tore it from my hands as I lay wounded and helpless.'

A loud, angry murmur broke from the whole circle of onlookers. The Emperor turned to Morlaine.

'Well,' he said, 'what do you say to this?'

The other's face was gray, but he spoke with a good voice. 'Captain Reynier is mistaken, sire,' he answered earnestly. 'He was wounded, and probably delirious. He does not know what happened, and imagines that he saw me do this thing. Your Majesty cannot believe that I should be guilty of such a crime!'

The Emperor made a quick step forward and raised his silver-mounted riding-switch as though to slash the other across the face. 'Listen, *coglione!*' he cried in a strident voice. 'I ordered Drouot's division to attack the enemy yesterday. I was behind your regiment when they made their charge. I watched the fight closely through my glasses. I saw this officer capture a flag; I saw you raise your pistol and shoot him down; I saw you tear the standard from him. Afterwards I had him taken to Austerlitz by two of my staff-officers. Do you understand me? I saw all this with my own eyes.'

Again the angry mutterings came from the officers behind me. Morlaine shrank back from the steely eyes and that terrible voice which seemed to sear him like a hot iron. The Emperor stretched out his hand.

'Your sword!' he said.

Morlaine presented it, trembling violently.

Napoleon took it, and with a quick gesture broke it across his knee. He threw the pieces to the floor.

'Captain of the Guard,' he ordered in a quiet, cold voice, 'you will arrest this officer. In an hour's time you will take a firing-party and have him shot outside the camping-ground.'

Morlaine uttered a half-strangled cry and tried to speak.

'Not a word, sir!' broke in the Emperor. 'I give you a man's death; it is more than you deserve. You, an officer in my army—bah! Out of my sight; you poison the air!'

He was led away by two grenadiers, reeling like a drunken man. In spite of all the evil I had received at his hands, I felt for the moment as if I could pity him.

The Emperor beckoned me to come nearer. 'Well, old friend,' he said with a smile, putting his hands upon my shoulders, 'I hope you are satisfied with my little plot? You must get your wound healed as soon as possible, Major Reynier, for one of the battalions of the Guard requires a new commander. When I find a man like you I wish to have him near me, for I feel that he compensates me for many villains.'

I suppose it was because I was weak and wounded, but at these words I became suddenly unmanned. I fell upon my knees, the hot tears falling. 'My Emperor!' I murmured in a broken voice. 'My Emperor!'

## TRANSPLANTED.

Last night I fell a-dhreamin' I was back in Cappoquin,
The hawthorns they wor' white wid flowers, the gold was on the whin,
The larks abow were singin', an' the clover at my feet
Was fillin' all the air around wid honey-scent most sweet;
An' in the uplan' meadow, a little piece away,
The lad I loved was workin' hard among the new-mown hay.

Och, here there 's full an' plenty; there 's gold, they say, galore;
My boys has both done grandly—what heart can wish for more?
I 've a girl to wait upon me, I wear a fine silk gown,
For Pat 's a wealthy gentleman that 's ownin' half a town;
An' Kate has pearls an' diamonds, an' Molly's only son
Will own a million dollars the day he 's twenty-one.

So they wouldn't rest contínted till I came acrase the say,
An' shared the luck that followed them, the four I sent away
Wid bitter pain an' sorrow, an' many a scaldin' tear,
An' prayers that followed afther them for many a lonesome year.
So I left my graves behind me, an' a weary way I came,
To find rich men an' women, but my childer just the same.

Ochone! but I 'm ungrateful, as Father John would say,
But in my dhreams I see them—the green hills far away;
The meadow where Pat courted me—ah, fifty year ago!—
The peaceful little graveyard where my darlin' man lies low;
An' little Nancy lies there too—the child I loved the best.
If I could sleep between them it 's sweetly I could rest,
Wid the larks above us singin', an' the gold upon the whin,
An' God's blessed sunshine fallin' on the hills o' Cappoquin!

# THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

ONE never abandons entirely the sentiment of the good resolution; but surely it is the case that the older one becomes, and the farther one passes on in the experience of life, the more is seen of the futility of all such resolutions the less inclination is there to attach any importance to them. It is more difficult to make new starting-points as the time of life goes on; and it is better realised that what cannot be done in the ordinary way by character and effort is hardly to be achieved as the result of a somewhat fanciful, and maybe unwilling, determination with nothing more to justify it than its attachment to a date. However, there are men and women in their thousands and tens of thousands who will continue to resolve with great heartiness and a sublime peace of mind, arising from a past that is conceived to be dead and buried, when each New Year comes along, as now. Their time will come when, looking back down the long vista of the dead years, they see the bones of all those broken resolutions, and, realising the pitifulness and the tragedy of it all, they will resolve to resolve no more. But for the present they will resolve. They may feel that they have had the most excellent examples set them. One of the foremost of London business men, who had risen from nothing to affluence, was once asked if he had any special suggestions that he could make in the way of New Year resolutions, and he answered by giving a list of thirty-six of them, the adoption of which in their entirety he heartily recommended. It embraced a very complete code of morals and conduct, but one that would be ultra ideal to most men and quite impracticable. The first article of this New Year code was, 'To be very careful not to do anything to injure my health;' and the last one was, 'To be true to myself;' while in between there were clauses for the strict prohibition of all intoxicants, tobacco, betting, losing of temper, quarrelling, the keeping of irregular hours, and, in fact, all those evils and weaknesses to which frail humanity is ever liable. One fears that in the matter of resolutions there is little safety or satisfaction in numbers and generalities; and a preference may be awarded to the specialist like Mr Will Crooks, the Labour leader, who, when asked to recommend a New Year resolution, said solemnly, 'See to it that the House of Lords is abolished as a legislative assembly.' To the average mind there are not many New Year sentiments that are better recommended than those expressed by Thackeray when he said, 'Who is there so good in mind, body, or estate but bettering won't still be good for him? Oh unknown Fate, presiding over next year, if you will give me better health, a better appetite, a better digestion, a better income, a better temper in '62 than you have bestowed in '61, I think your servant will be the better for the changes.'

* * *

It so happens that in this year of 1910 the leading show of the exhibition order, the display which has come to be a settled annual event—one in which not only London but the country takes some particular interest—is to deal with Japanese matters. We shall be given some close views of Japan as she is at home, how she lives and does her work, and the great variety of her modern interests and her wonderful activities. It goes without saying that the feeling of sympathy on the part of Britain for Japan has been very strong for some years past. The sentiment was at its height at about the time of the war with Russia and for a little while afterwards; whether it is quite so strong at the present time as it was then is a debatable point. Even though we might take the Japanese view in the recent threatened difficulties with the United States, which happily passed off without any unpleasant realisation, yet affairs of this sort tend to bring us to different thoughts on Japan from those which we entertained some ten years ago. She is no longer the plucky little nation fighting bravely for her rights, with enemies

[*All Rights Reserved.*]

all about her who, as opportunity offers, will bully her with their superior strength. There are strong and powerful nations with fine instincts who like at such times to extend their kind patronage and sympathy to the little one, and are constantly enthusiastic in their admiration for her. But Japan has long since passed the stage when she welcomes any patronage; and the world in general, while regarding her with good feeling, has, for the most part, come to regard her as a very likely danger of the future—one, indeed, that is almost inevitable, though it may not be her own fault. In London people feel less disposed to go out of their way in these days to display any strong emotions of affection for our Eastern friends, because we see so much of them. It is not long since the Japanese man and woman were curiosities in the streets of the Metropolis; but the influx of these keen, yellow people during the past three or four years has been very marked. Now there are the Japanese everywhere. It very seldom happens that a glance round any of the carriages on the tube railways, in the busy hours when people are going to and returning from the City, will fail to result in the discovery of at least one young Japanese man, always attired in the most conventional English costume and generally studying some work of technical instruction. So we, the natives, have come to realise that these Japanese are swarming into our country for the obvious and undisguised purpose of learning all that they can of our ways and methods of work and manufacture, and then returning to their native land with the view to doing these things as well or better than ourselves, and then, most likely, cutting us out in the markets of the world. That is just the view that the simple Briton takes when he sees the young Japanese sitting opposite to him in the railway carriage, thinking hard over the points that are set before him in the book that he has under examination. However, no great harm is being done, nor will be. Sentiment of a somewhat undiscerning kind has given way to common-sense and a realisation of essential circumstances, and there must be more general satisfaction in such a state.

* * *

But what it is desired specially to point out at this moment is that, by a curious coincidence, there has certainly been a strong wave of sympathy with and interest in all things Russian passing over the town. It is perhaps the first time that such a feeling has been exhibited within living memory, and it is not easy to account for it. That it has existed in reality, and is not merely something of the fancy which has been described at length by some interested persons and bodies in order that what they hoped for might perchance thus be brought into being, there can be no doubt. These waves of sympathy with different foreign countries and people are no new things. There is usually one in every year, and most of the nations have their turn with us. There is no evidence, however, that there has been any artificial creation of our interest in Russia. It has been displayed in many ways. There have been inquiries concerning matters of Russian art and literature, and Russian 'turns' at the better class of places of variety amusement have been numerous and successful; and it is even to be noted that some favour has been extended to Russian dishes that have been served at the restaurants. One fears, however, that there is too great a disparity between ours and the state of Russian advancement and her tastes in general to permit of any considerable assimilation of them by us; and, indeed, almost the only thing Russian—save the beauty of some of the Russian women—to which we can extend any permanent and sincere admiration is Russian music, and of that there is only a little. What we have specially to say, however, is that just when the Russian 'boom' that we have been speaking of became most conspicuous the Russian music held such a place of favouritism in the leading concert-halls as never before. It was actually the case that on one Sunday afternoon, at the concerts that have become such an established and popular feature of life in the Metropolis, the same piece—perhaps the finest of all the Russian classics, Tschaikowsky's sombre and gloomy '1812'—was performed at three different halls, in two cases by orchestra and in the other by violin. We have also had Tschaikowsky concerts, made up of nothing other than music by this composer; and there has been a considerable disposition on the part of the musical public to read up the circumstances of the life of this one and others, such as Glozonoff and Glinka. Much of this Russian music makes a strong appeal to people of Western Europe, accustomed to over-elaboration, by reason of its strength, its simplicity, and its rough grandeur. A touch of the semi-barbaric is splendid in music, as it is not in most other arts. Mentioning the matter kindly, even appreciatively, it has still to be said that Russia is strongly barbaric in comparison with the other nations of Europe. Here and there, from out of the rough mass of Russian humanity, there has occasionally emerged a genius; but according to Western standards, Russia until lately had little in art and literature that appealed to the Western world. In all the circumstances of the case, it is a little puzzling to find out the cause of this wave of sympathy to which reference has been made. It may have originated through the music, or it may be that, with so much evidence about us that we are suffering keenly from the effects of over-civilisation, there is some pleasure and satisfaction in contemplating a European nation that many people regard as more under-civilised than over, and showing some acts of friendliness towards it.

* * *

It was very noticeable that, during the last series of autumnal gatherings of representatives of religious bodies of all kinds and strengths, a leading place was given in the discussions to matters concerning

the state and prospects of our marriage laws, and particularly those relating to divorce. Generally, these discussions were pervaded by a very evident apprehension that changes were pending which, from the religious point of view, would be anything but well, and that even at the present time there were grave evils which needed all the powers of the Christian Churches to counteract them. No sooner have these meetings broken up and the delegates returned to their several homes than there comes the announcement that forthwith a new Royal Commission is appointed, which will sit in consideration on the law of divorce and its administration. It is a very strong Commission; none better qualified to give calm and effective contemplation to such a gravely serious subject as this has ever been appointed. There is the feeling abroad that in the future the marriage tie will inevitably be slacker than it has been in the past, that the state of marriage will be regarded as much less impossible of dissolution, that the facilities for divorce will become much more numerous and easy of application. How far these are desirable ends, and how far otherwise, it is not easy for any impartial observer to determine. One must have a great sympathy with the attitude of the Churches, born of their fear that the sanctity of marriage is being disregarded and soon will be so completely. When the wedded state is recognised as being merely a legal arrangement, however necessary in the interests of the State, the way will be clear for all manner of changes. When marriage is stripped of religious sentiment, and personal attachment of the parties to each other has ceased, it is little enough of a bond that is left. The Churches in their wisdom, and showing fight to the forces that are brought against them, are pleading for the maintenance and the protection of the British home. Their view is simply that those whom God has joined should not be put asunder, and, further, that divorced persons should not be permitted to remarry. It is a question upon which religious and secular feeling is likely to be more sharply divided than any other, and one gathers that there is every probability of its assuming a far more important and public place among the questions of the day in the near future than it has done. Most of those who sympathise very strongly with the Churches' view have yet to realise that just as the hold of the Churches on the great masses of the public, particularly in the large towns, is not so tenacious as it used to be, so also there is an increasing feeling of dissatisfaction at the state of our marriage laws, which, as against the Churches' view, are held to be too strict and unfair and to defeat their own objects. It is sad that it is so, but it is certainly true that—in the large centres of population, at any rate—home-life counts for less, far less, than was once the case. Married life spent in flats and hotels, and the increasing disposition of women (upon which so much comment has been made) towards gaieties and luxuries rather than the fulfilment of more natural obligations, show plainly how this advancement of civilisation, as we call it, is against the home-life and the cultivation of the married state in its best form; and this is proved again by seeing how, in the lonelier country districts, the home-life is so much sounder and the prevailing feeling is so much more in favour of the tightening of the marriage knot rather than of relaxing it.

However, as apart from one view or the other, there are certain facts to which the Commission will give its most serious attention, showing that everything is certainly not well with the laws of marriage in the country where, for all the talk of divorce facilities, it is more difficult to get divorce than in any other. At the present time, unless abject poverty is pleaded, it is not to be got for an expenditure of less than fifty pounds; so that it is beyond the poor person, and one of the duties of the Commission will be to see how far powers may be granted to the County Courts to give it. The really great question, however, is whether it would or would not be better to grant complete divorce in many of those cases where now only an order for separation is allowed. There is something about the separation-order that fails to satisfy any class of persons, whatever may be the general view. It seems to be wrong in principle and in practice; and yet these separation-orders, with all the cruelties and injustices that they inflict, are being granted with the utmost freedom because it is not known what else to do in the circumstances. The Churches are naturally more for the separation-order than the divorce; but it is easy to show that the former is far more conducive to a bad state of things morally. This question is just one more in which the old tenets, the old views, and the old customs that have satisfied the people for generations and centuries are brought up for revision. It is not enough to say to the iconoclasts of the period that what was good enough for our forefathers should be good enough for us. With the times, the manners and views of the people change. Marriage hitherto has been judged chiefly from the points of view of religion and sentiment; there are not wanting those who predict that henceforth there will be an increasing tendency, soon to become an overwhelming one, for it to be judged from the point of view of what is called common-sense and expediency. Did not George Meredith predict, with strong conviction, that at one not far-distant day the conditions of marriage would be entirely changed in the direction of its being allowed for a period —say ten years? It is difficult to contemplate the possibility of such a change with equanimity; but are the tendencies of the time leaning towards it?

# LAURISTONS.

## CHAPTER IV.—HOW AUNT CHARLOTTE CAME TO BE HERSELF.

AUNT CHARLOTTE added little to the comfort of family life, and by the younger members was regarded with distinct disfavour. She was, perhaps, in view of her maternal descent and her upbringing, no more than might have been expected; but she was undoubtedly at times a trial to those about her, and more especially and at all times to the younger folk.

Her mother died when she was five. Her father was immersed in his widening business affairs. Her step-mother would have taken the place of her own mother to her if the child would have permitted. But little Charlotte was unresponsive—self-sufficient even at that age, a characteristic which increased with her years, and which doubtless came in part from the Lauriston blood in her.

The coming of the boys drew her out of herself for a time, and into the family life; but by the time they were five and six, and she twelve, the quarrels among them became so constant that there was nothing for it but school for Charlotte, and at boarding-school she remained until she was eighteen.

The atmosphere in which she lived at school—the fulsome adulation and shameless toadying to the wealthy heiress, who had more money than she knew what to do with, and knew how to get her own way in most things—was enough to turn any girl's head, and Charlotte's case had presented no difficulties.

Charlotte, 'finished' at eighteen—that is, turned out with a certain acquaintance with the polite accomplishments, a modicum of knowledge, and a very large opinion of her own importance—was Charlotte spoiled for life.

Her step-mother was dead. Her half-brothers, George and Charles, were still in the unlicked stage which expresses its likes, and more especially its dislikes, with uncompromising outspokenness. Her father had little time to give to her, and she manifested no particular desire for a larger share of it.

She came out under the chaperonage of her aunt, the Countess of Berrymead, was presented at Court, and soon found that a young lady of fortune was not like to lack suitors while younger sons abounded.

At nineteen she had had half-a-dozen offers of marriage, and from among them chose for her future husband the Hon. James Moyle, second son of the Earl of Molesey. Then Lord Henry Peto came along. There were only three lives between him and the dukedom, and to the everlasting disappointment of his old creditors and the enragement of his new ones, the Hon. James found himself out in the cold.

But presently he was chuckling over Miss Charlotte's own discomfiture. For Lord Henry meted out to her exactly equal treatment by marrying half a million in cash and a large and increasing income from a brewery, and, incidentally, the young person to whom these things appertained.

Charlotte, smarting under the rebuff, withdrew from society, and gradually settled down to a life of single blessedness, or otherwise, travelling occasionally on the Continent with her maid Honeybun, and living when in London at her father's great house in Grosvenor Place, where she had her own apartments and could do pretty much as she pleased.

When Charles married Mary Hamilton, Sir George insisted on the young people living there also. There Charles and Mavie were born, and there they and their mother lived very happily with the old man while Captain Charles was away with his regiment in Holland and elsewhere.

Mary Hamilton, as I have said, was a notable beauty, but her face was not the only or most beautiful thing about her. She had a sweet, strong nature, and a sympathetic charm of manner that captivated even Aunt Charlotte. As for Sir George and brother George, they simply worshipped her.

It was only after her long illness that Captain Charles bought the house on Castle Bear Hill, at Ealing, in the hope that the country air and quiet might help her back to health. And there, for the past three years, she had spent seven months out of the twelve, returning to Grosvenor Place only when the long, dark nights made the closer society of town preferable to the loneliness of the country.

Captain Lauriston spent his Sundays there without fail, and rode over as frequently as possible between times, sometimes every day in the week; and, so far, being always well armed and known as a fighting-man, he had suffered no molestation from the footpads and highwaymen who infested the outskirts of the City and the suburbs. Sir George came down from time to time, and Aunt Charlotte, under the mistaken belief that her presence was a comfort and assistance to her sister-in-law, came over also and stopped for weeks at a time, greatly to the dispiritment of the younger folk, who detested her most cordially—all except Etienne, and for that exception in her favour there was good and ample reason.

## CHAPTER V.—HOW THE MARQUIS CAME TO QUEEN STREET.

UST five years before, there walked into Lauriston's bank one cold morning an elderly French gentleman of short stature, thin, clean-shaven face, immaculate clothing which had seen better days, and most elegant manners. He was accompanied by a peaky-faced boy of seven, whose large black eyes still held the scare of unwonted sights.

Would monsieur the head of the bureau have the extreme kindness to procure for monsieur an interview with Sir George Lauriston?

'What name, sir?' asked old John Sax, who had been casting them up in his mind.

'The Marquis de Montessonne—from Paris.' And John Sax was back in a moment, begging the marquis to follow him into Sir George's private office.

'You are from Paris, M. le Marquis?' said the banker, eying his visitor keenly from under his bushy gray penthouses.

'We left there three days ago, monsieur. It is all over,' said the old gentleman quietly with an inimitable gesture of finality in the flicker of his white hands.

'You saw it?'

'With my own eyes. May the good God, whom they deny, requite it to them to the last drop!'

'We had the news, but could not credit it. Where are you getting to over there? What is to be the end?'

'They are no longer men; they are wild beasts—devils. Before long they will turn and rend one another. Then we others shall come to our own again. Their bodies will make the soil fruitful.'

'And the Queen?'

As to the Queen, M. le Marquis could only raise his arms and drop them in unutterable expression.

'And yourself, M. le Marquis?'

'I shall wait here. There is no safety but in England. What little I saved from the wreckage has gone for the cause, all but some jewels. They may suffice. It cannot be long.'

The banker nodded. In view of the monstrous past, the future was beyond any man's forecasting.

'And this—is?' and he looked at the peaky-faced boy with the scared black eyes.

'My grandson. His father died at Jemappes.'

'You will permit me to do what I can for you while you are here?' At which M. le Marquis bowed very elegantly. 'Have you fixed on a residence?'

'We arrived only an hour ago. Can you advise? It must be not too costly. In fact'——

'John Sax can help us there.' And John Sax, summoned, suggested, after deliberation, that if the marquis would partake of the hospitality of his house in Queen Street, Westminster, for a few days it would afford him time to look about him.

And the marquis and his grandson had lived with the Saxes ever since. After the terrible times of upsetting through which they had passed, the quiet sanctuary in Queen Street was grateful to them.

Before the proceeds of the trifling salvage of his fortunes were exhausted, M. le Marquis bestirred himself to find pupils in the French language; and his standing, and the elegance of his manners, procured him a sufficiency of engagements to keep himself and the boy in simple comfort. They paid for their rooms and their living, though it is not likely that the price they paid would have procured them equal comfort and consideration anywhere else within a radius of twenty miles.

Sir George, who had met the marquis on one occasion at the French Court when across there on business, would have assisted him in money matters. But the old gentleman, with a delicate sense of the doubt which must attach to his future fortunes in all minds but his own, declined all such help, and occupied the higher position among his new friends in consequence.

Sir George exerted himself to procure him pupils, and invariably invited him to the grand dinners he gave from time to time at his house in Grosvenor Place, and on such occasions the marquis justified his friend by the quiet elegance of his attire—which was invariably black, tastefully relieved by priceless lace, however—and by the grave dignity of his deportment and conversation.

The City and financial magnates, and even His Majesty's Ministers, who at times graced the banker's board, found endless entertainment in the old courtier's vivid and terrible accounts of life in France before and during the catastrophe. He came to be well known and highly esteemed for the quiet grace with which he confronted the evil times. His circle of acquaintance extended. He might, if he would, have dined out every night in the week, and sometimes did so, for he loved society, and the courtesies extended to him palliated to some extent the grievous misfortunes under which he suffered.

Whether at home or abroad, in the simple ménage in Queen Street, or with patient long-suffering imparting to dull heads and bungling tongues the niceties of his beloved language, or mixing as an equal in the gay *salons* of the wealthy, he was always the same—quiet, suave, polished, with a grace of manner and ease of deportment which the Prince himself could not excel, reserved if anything, but genial and easy to converse with when such was desired of him, and at times cynically bitter regarding the parodies of humanity who paraded before the eyes of an astonished world as the representatives of the *grande nation*.

True to the pledge he had given on Dunkirk sands, Captain Lauriston had insisted on under-

taking the education of little John Sax. Charlie Lauriston and he were the same age within a week, Charlie's birthday being the 18th of June and Jack's the 25th. They commenced their school career at the academy of Mr Wrather, in Little Chapel Street, on the same day, and were inseparable chums—except, indeed, in their classes, for there Charles went ahead like the proverbial hare, while Jack, the tortoise, plodded stolidly in the rear; what he learned, however, he learned very thoroughly and knew it for life, and by dint of honest hard work attained fair positions in his classes, of which Charlie was generally the head.

When Etienne came to live in Queen Street, his grandfather, determined he should make the best use of his time, came to an arrangement with Mr Wrather which gave his grandson the advantages of the school and the school the advantages of tuition in French by the Marquis de Montessonne—an arrangement which, in its preliminary stages, caused Etienne no little discomfort.

But that soon wore down under the tactful management of M. de Montessonne. He succeeded in the almost impossible task of winning the boys' regard by his genial courtesy and an occasional dip into recent history across Channel, as seen by an eye-witness at risk of his life. The lads came to esteem him for what he had gone through and his manner of bearing it, and their liking for the old man sufficed at times almost to cover the discrepancies of Etienne.

Charlie Lauriston and John Sax stood by the peaky-faced one manfully as one of themselves; but their loyalty suffered cracking strain at times by reason of the French boy's whimsicalities of behaviour and outlook. His training at home had been purely priestly, and the influence of the priest never yet made for those niceties of schoolboy honour which flourish in the British boy's heart so much more lustily than does, as a rule, the desire for learning.

Etienne doubtless had his own code of morals and his own point of view. But they were not precisely of the English pattern, and he had many a bad quarter of an hour.

Charlie and Jack stood up for him when they could; but at times, and when occasion seemed to justify it, Charlie would say, 'He must just take his licking. It'll do him good. What queer beggars Frenchmen are!' And it was no easy matter to explain to Etienne why they would fight for him one day and not another, the minute ethical differences in his conduct being hidden from him by his nature and training. As he got more into English ways, however, and by dint of very many thrashings, his mental obliquities began to straighten out, and life became somewhat less ignominious and forlorn for him.

It was through the constant association with Etienne and M. de Montessonne at home that John Sax acquired that knowledge of French, and the still more difficult faculty of speaking it not like an Englishman and not altogether unlike a Frenchman, which in due time was to stand him in such good stead and to make so mightily for his happiness and increase.

Mavie had not yet begun schooling. So far her mother and Hepsy, and an unusually bright and active mind, had sufficed her. She assimilated knowledge from all about her as a plant drinks in the air and sunshine and transforms them into things of visible beauty. Old Jerry was her very special crony, and from him she drew vast stores of information of a most remarkable kind. For Jerry had seen and done much in his wandering life, and the simple facts were enough to fill the small girl's mind to overflowing, without any embroidery of imagination, of which both he and she possessed full share.

The boys were out of school for a time by reason of a most propitious and delectable outbreak of measles, at the importation of which into the monotonous curriculum of the middle of a working term they and Mavie rejoiced exceedingly, and ceased not to invoke blessings on the head of the unconscious benefactor of his fellows.

Captain Lauriston ordered the youngsters to Ealing forthwith, and would not hear of any discrimination between them. The house was large, the change would be beneficial to them all, and Mavie, he knew, would rejoice in their company.

And so they revelled in the loosening of their shackles and the freedom of the country-side, within strictly defined and, as they learned by experience, very necessary bounds. For on two occasions, before limits were imposed, Charles and Mavie, wandering free, had fallen on trouble which might have had serious results—once through capture by a band of gipsies, from whom they were only rescued after a whole night's detention by a passing horse-patrol, attracted to their evil case by the lusty signals of distress which Charlie managed to evolve before his mouth was closed by blows—which night caused their mother agonies of apprehension and a corresponding lapse in health; and the second time from a savage attack upon them by a footpad, whom they had unwittingly disturbed in his lair in a thicket near Alperton. There were many such about, for the country was in a state of chaotic distress, and Charlie bore the marks of that encounter for many a day.

Thereafter they were restricted to the meadows along the home-side of the Brent, which allowed them ample scope and yet were within view of the house on Castle Bear. Whence Mavie's wrath at Etienne's breaking of bounds and of the rules of the game, more, perhaps, from his daring to go where she was not permitted than from any innate love of bounds and rules; and Etienne's not unreasonable fear lest their general trespass should come to the ears of his grandfather, and result in an abrupt termination of his visit.

*(To be continued.)*

# A QUEENSLAND ISLAND.

By Dr J. P. Wilson, Melbourne.

MAGNETIC ISLAND lies on the nineteenth parallel of south latitude, and is therefore well within the protection of that Great Barrier Reef which breaks the long swell of the Pacific tides. 'The island was so named,' says Captain Cook in his famous diary, 'because the compass did not traverse well when they were near it.' Modern observation, however, has not confirmed this alleged eccentricity. The area of the island is about twenty-four square miles, and its triangular mass is wedged into the mouth of Cleveland Bay, whereon Townsville is built, with the mining centre of Charters Towers some miles inland.

Magnetic Island is vertebrated by a granite range, seamed with veins of quartz and dolerite, indicative of precious metals. Pines and more indigenous trees crown the hills. Patches of corn and vegetables, plantations of pine-apples, papaws, and grenadillos, straggle along the flats; but the greater part of the lowlands is still covered waist-high with tussocky grass, reeds, and scrub, fearfully suggestive to the new chum, as he wades through it, of snakes, scorpions, centipedes, and loathsome reptiles in general. Yet some day these flats will fatten droves of cattle and be studded with homesteads. A bush-fire amid this rank growth is a thrilling spectacle. The flame curls in spirals up the trunks of the palms, and then bursts into a nimbus of light around their feathery tops. The coast is indented with inlets whose beaches are glowing sand, fringed with she-oaks and ringed off from the interior by hillocks of gigantic boulders. Two distinct chains of coral-reef encircle the shores of the island. The closer reef is exposed with every tide, and from it beautiful specimens of coral may easily be gathered; but it is only at particularly low water that the jagged edges of the outer reef protrude above the sea.

About forty men, women, and children live permanently on the island; but in summer hundreds of gasping citizens rush over from the mainland in search of cooler air. A tent or hut of corrugated iron, with a door at each end but without a window, affords sleeping-space; but even at midwinter eighteen hours daily may be spent in the open. In June the sea-waters are pleasantly warm for bathing or wading; the coarse, hard sand of the beach makes an agreeable promenade for after-dinner strolls; oysters may be torn from the rocks at low tide; the pools are swarming with mullet, rock-cod, and garfish. In a flat-bottomed punt one may pull lazily to a shady nook to read or fish or look down into lovely gardens of many-hued coral, in which huge sea-anemones blossom and gaudy fish disport themselves. Inland there are hills to climb, gorges to explore, waterfalls to admire. Gorgeous butterflies rise before us in clouds; bright-plumaged parrots, green-crested white cockatoos, and leatherheads make the woodlands sonorous with their several varieties of screech; whilst white and blue herons, gulls, hawks, and eagles keep nearer the shore. Wallaby, goats, and pigs run wild amongst the gullies.

The views from the higher land are magnificently picturesque. Looking towards the mainland, one sees to the left the sombre cliffs of Cape Cleveland, and far away the blue outlines of Mount Elliott; the red sandstone of Magazine Hill and the ridges with the Townsville buildings lie in front; the leonine curves of Castle Hill are the background to these, and taper gracefully down to Kissing Point on our right. Turning round, we look over the expanse of Magnetic Island, set in an emerald sea, wherein, in the dim distance, Palm Island and many a similar jewel are shining.

Even the most lethargic of men or women, however, may, from a beach-seat, gaze on scenes of marvellous beauty at each successive hour of the twenty-four. At the first touch of dawn snowy clouds are seen to twine about the peaks, like folds of gauze round an Eastern woman's head; the sea is dark green; the landscape blurred by rising mist or mountain shadows. When day really breaks, the cloud-veil becomes a crown upon the head of a verdant hill; the valleys are flooded with sunlight; the sea shades off into a silver-blue wherein adjacent heights are purely mirrored; lace-like falls and shining streams are on every side revealed; the twitter of birds, the hum of insect-life, the low of beast begin. A third transformation may, in a twinkling, let loose a cyclone to churn the waters into ink, and shut off both hill and vale from view. But it is just after sunset that the boldest, yet most harmonious, colouring is to be seen. The open waters of the bay then become resplendent with a delicate, flesh-like pink glow; nearer shore the surface is alternately deep green and light blue. The land lends the bold dark grays of the granite, flanked with red masses of sandstone; whilst the eastern hills infuse a pale-blue tone into this glare. Above, the glorious iridescence of the western sky dominates the colour-scheme with a brilliancy which no impressionist has ever dared to imitate. But soon all this colour fades into a uniform gray, the stars come out, the sea is phosphorescent, the hills tower gloomily overhead, the rocks twist themselves into columned temples, the trees are nodding sentinels; only the lap of the tide, the bell-note of a frightened bird, or the sigh of the fresh south breeze breaks in on Nature's repose. We, too, sleep.

# THE FORGOTTEN ROCK.

## CHAPTER IV.

The Shadow, cloak'd from head to foot,
Who keeps the keys of all the creeds.

AN hour later two Finns were standing beside the unlit bonfire at the top of the ridge.

'"Tis a steep climb on the Forgotten Rock, Erik,' said one of them, wiping his brow and panting; 'and you and I are older than when first we lit the Kokko fire together.'

'Every climb, ay, most things grow more difficult as we grow older. 'Tis easier to go downhill now,' said Erik; 'but the Rock is forgotten all the year round, save when we light the beacon on the Eve of Saint John. Our sons shall light it when we are at rest, let us hope, and their sons after them.'

'It is so,' nodded the other; 'it is so. But let us waste no time, for we must sail back in time to see the young folks dance.'

He lit a match and held it to the cut brushwood round the pile. The dry branches crackled and blazed, the two men watching the flames rising. Then Erik produced a flask of corn-brandy.

'Summer always with you, friend Mattias!' he said. 'With you also!' said Mattias; and the two old friends pledged each other.

'Look! let us hasten back!' said Mattias. He pointed to the points of flame in the distance, where the Kokko fires were kindled, ruddy dots in answering signals to each other along the coast. The two men had just begun the descent, when Mattias almost stumbled over the rope tied to the pine-trunk.

'See! A rope! A gun and knapsack! I know them, Erik! They are the tall Englishman's from the steamer.'

The Finnish peasant is not given to unnecessary speech. The two men looked stolidly at the rope for a minute; then they hauled it slowly in hand over hand until the stone appeared at the cliff's edge.

'Heliga Jungfrun, Erik! Something may have happened! The Englishman must have gone away, intending to return.'

'Nay, I think not, for the large Scottish captain told me that his ship would surely sail to-morrow.' He paused and looked at his friend. 'Time was when we would have gone up and down the rope like squirrels on a fir-tree; but now'——

'Let us hurry back to the ship, and if the Englishman is there all is well! If not'—— He pointed down the cleft, and shrugged his shoulders, and together they hurried down the slope, manned their little boat, and headed for the *Covesea*. Her deck was empty when they came in sight, save for Flett's big form leaning over the rail. He met them at the gangway, and Mattias's first question roused him. No; the English gentleman was not on board. What! Could Mattias not speak Swedish? Yes! Ah, that was better. Gradually he got the gist of the man's story, and in a trice he was beside the chief engineer.

'We've jist *got* to take the loan of the quarry's steam-launch, Mac,' he said, pointing to the little vessel, and rapidly gave him the bones of the Finns' information. Then he hurried forward and brought back a block and tackle. They jumped into the launch, followed by Mattias and Erik, and the launch fussed out of the bay, the captain steering.

'Let her rip,' said he, 'if you've to rattle the bolts out of her!' The engineer nodded. Every plank shook as she tore through the water. No one spoke, the captain drumming an impatient tattoo as he watched the goal draw nearer. The engineer took the last inch of speed out of her, and she ran swiftly to the Forgotten Rock under the guidance of Mattias in the bow, and into a rock-lined alley of smooth water. Flett was out in an instant, up to his knees in water, the block and tackle under his arm, shouting for the others to follow, outdistancing them easily, clambering over rocks, swinging round the trees, breaking into a run on the more level ground, going straight up without a look behind. When the others reached the crest, sweating and panting, he had already fixed the block and tackle to the tree. He pointed to the cleft's edge.

'I'm going down. I'll signal you when to haul,' he said, and swung himself over, out of sight.

The sun was now low down on the horizon, and the cleft half-lit and chilly. When his feet touched the ground he paused to recover his breath and listened. Some one was talking in a soft, childish voice, a thin treble laugh stealing along the cleft in a whinnying echo. Flett called a hoarse 'Hallo, there!' and waited. His voice reverberated along the cleft, but the quiet voice talked on, ignoring him. The sound of it was quite near him, round a spur of rock. He stepped on tiptoe forward, peered round it, and stood stock-still, frozen with horror and astonishment, staring at Westwater, who was half-lying, half-sitting opposite the grinning skeleton. One of its hands was in his, the handkerchief off its head, the thing wearing its fixed smile. Westwater's face was ghastly, blood on his lips, as he spoke to it in a whisper.

'Dick, waken up! You'll die in the snow if you don't. We'll get them across to Amsterdam, Dick! Eighty thousand golden sovereigns, Dick! Eighty thousand! Come, we must hurry. What a time I've had since the *Dark Rosaleen* night! They thought all the earths were stopped. But they were all at fault.' Then he sang in a child's treble, swinging the dead arm to the tune:

'There's only one cure for all maladies sure
That touches the heart to its core,
'Tis the sound of a horn on a fine huntin' morn——

Hounds were called off after a good run, eh? A good run!' He gave a dreadful, hollow laugh.

The skipper stepped forward and laid a gentle hand on his shoulder. Westwater slowly dropped the skeleton's hand, looking up at him without knowledge in his wide-open dark eyes, lowering them slowly to the belt on the ground, fastening them on it in a steely, idolatrous glare.

'Look, Ninette! Look!' he whispered, and began to unfasten the belt.

A nameless dread seized the other man as he listened and watched him groping in the half-world of his delirium.

'Look! Eighty thousand! Pigeon's-bloods, every one of them. For you, Ninette!'

He held his hands cupped together, and bent as if to kiss the something in them, greed and triumph in his eyes. Flett drew a long breath in amazement, for there—interchanging countless lambent lights, aglow with life and fire, as though the warm blood throbbed and raced in them, beautiful, alluring, joyous—lay a little pyramid of magnificent pigeon's-blood rubies. Westwater turned them over lovingly, half-childishly, whispering to himself. Delicate spurs of violet radiated from his cupped hands, twinkled into hyacinth, into purple, melted again mysteriously, crumbling into the living, trembling carmine of the rubies, bewildering gems, fit to shine on the white throat of Titania. He took up the belt again, their ruddy light sending shafts through the darkening cleft as he replaced them, and buckled the belt round his waist. Then he gave a deep sigh and closed his eyes, as one tired and bent on sleep.

Flett bent over him, shaking his head as he saw the ugly wound on the skull. The fallen rock beside him told its own story. The captain steeled his nerves, set his jaw firm, and came close to the skeleton. He looked carefully around it, finding nothing except a pipe, the rags of clothes, and the rat-gnawed shoes. He took off the belt from Westwater's unconscious form, buckling it round his own waist for safety. Then he fastened the rope-gear securely under Westwater's armpits, signalled to the anxious waiting men at the top, and with a sailor's handiness climbed up by the other rope, reaching the top at the same moment as the unconscious man.

'Dooms bad!' he said to the engineer as they laid their burden on the ground. The flames of the Kokko fire leaped and danced round them. There was silence for a moment.

'We must get him to the ship,' said Flett with a break in his voice. 'He'll no' last till mornin', an' there's no' a doctor within seeventy mile.'

The four men slowly, foot by foot, carried him down the slope to the launch. He neither opened his eyes nor spoke; but for his heavy breathing he might have passed for a dead man. They reached the *Covesea* at midnight, around them the wonderful white night of Finland, with its magic, tender light, not of night, not of day, to southern eyes almost theatrical in its effect, the flush of evening merging imperceptibly into, joining hands with, the dawn; the mirrored isles lying in serenity, their outlines softened; no sensuous colouring, as in a tropic night, but over all a cloudless dome of sky, of the clarity of an English noon, with an added mysterious peaceful beauty; the hush and the infinite distances edging the nerves, striking hidden notes of waiting and expectancy. Flanked by the green arras of the woods, the long line of the fires of Midsummer's Eve a twinkling gigantic chain of footlights, in the dead stillness, in the absence of a shadow, of a single star, it seemed as though Some One had rung up the curtain on a speck of poor human incident, trivial, infinitesimal, miserably out of scale on the vast Olympic stage.

*(To be concluded next month.)*

## THE MONTH: SCIENCE AND ARTS.

### PRINTING WITHOUT INK.

THE huge modern printing-press requires type and ink, as did the early inventor's crude hand-press; and there has been no radical departure from the process as used by Caxton. Now, however, an invention has been perfected, and rendered commercially possible, which promises to revolutionise the whole printing industry. It dispenses entirely with ink and its attendant intricate distributing mechanism. The process is entirely electrical. One electrical pole is connected with the forme of type, and the other pole with the platen which carries the paper and presses it against the type or block to be printed. The result of the impression is that a clear imprint of the characters is obtained. The process is extremely simple, and dispenses, furthermore, with a considerable amount of the essential preliminaries in printing operations described as 'making ready.' Normally the imprint thus obtained is a sharply defined dense black, as is usually required; but, if desired, any requisite tint can be obtained. This latter development is probably the greatest feature of the process, for it renders colour-printing extremely simple. Instead of there being a certain delay between the red, blue, and yellow printing, as is now essential to permit the successive coats of applied pigment to dry, the three impressions can be made instantly after one another. For ordinary newspaper-printing the invention possesses great possibilities. It eliminates one-fourth of the complicated mechanism of the press—the ink-rolls and ducts—so that the dimensions

of the machine can be considerably reduced. Moreover, a heavy source of expense is eliminated, as the ink represents a certain outlay, while the ink-rolls require frequent repair. There is a complete absence of smudging, as, there being no deposit upon the paper, there is no extraneous matter to rub, as is the case with pigment. The process is applicable to the finest grades of art-work and block-printing, and a booklet that has been printed by the inventor by this means is far superior to the product of ordinary manufacture. Very little current is required to bring about the desired impression; and it can be made darker or lighter, as required, by increasing or decreasing the strength of the electric current. To bring about this end efficiently and easily, the inventor has devised a special type of resistance whereby the flow of the current is controlled as easily and as delicately as the flow of a fluid through a pipe by means of a tap. The manipulation of the process calls for no electrical skill, and a boy can work it. Another valuable feature is that the question of repulping waste is solved. Under present conditions the waste cannot be repulped to render it available for further printing operations, as the removal of the ink is a difficult stumbling-block. In the electrical process, however, the 'waste' is merely immersed at the paper-mills in vats containing a certain prepared and cheap solution, which causes the impression produced by the electric current to disappear, and, after repulping, the paper can be used again. In the course of private demonstrations carried out before the writer, the simplicity of the process was strikingly apparent. Even a coin laid upon the paper and slightly pressed leaves a clear impression. It may also be pointed out that the process involves no wear and tear upon the type or metallic surface of the block, and that no action is set up by the passage of the electric current.

### A NEW PERISCOPE.

Since the British submarine was run down in the Solent by the *Berwick Castle*, owing to the helmsman of the former not observing the approach of the latter, efforts have been made to improve the periscope, which is the eye of the underwater craft. The disadvantage of the old instrument is that it only gives the view of a partial field—that directly and immediately ahead—of the sea; consequently the observer is in ignorance as to what is approaching from behind or on either side of him. In the new instrument a decided improvement has been effected, in that the view is a continuous panorama of the whole of the area around the submarine. This complete circular view has been ingeniously achieved by a new arrangement of the lenses, and the image is projected on the eyepiece with striking definition of detail and luminosity up to a range of about eight miles. The Admiralty have tested the device, and have been so impressed with its advantages that they suggested certain improvements to accommodate the instrument to the new developments of naval warfare incidental to the introduction of the *Dreadnought* class, by increasing its range of vision up to thirteen miles.

### CURE FOR SNAKE-BITES.

Though venomous snakes are not often to be found in these islands, occasionally a snake-bite terminates fatally. In Austria, however, the position is vastly different, for the country is so overrun with the reptiles that they are regarded almost with fear by the inhabitants. The Government endeavoured to cope with the situation, and urged the residents in the rural districts to spare no effort to bring about their eradication, at the same time giving valuable information as to the habits of these undesirable pests and the best way in which to subdue them. In order to stimulate the co-operation of the peasants, a reward is offered for every snake killed. Some idea of the extent to which the country is infested may be gathered from the fact that in 1908 no less than two hundred and seventy-three thousand snakes were destroyed, of which all but four thousand belonged to venomous species. To aid the rural inhabitants in their warfare, the Government authorities have supplied a simple appliance whereby, in the case of a bite, the possibility of a fatal result is reduced to the minimum. This instrument comprises a small knife wherewith the wound of a bite is immediately enlarged, and in the cut thus formed a concentrated solution of permanganate of potassium is injected, as medical research has shown that the poisonous effect of the venom, in the great majority of cases, can be negatived thereby. That such a precaution is valuable is borne out by the fact that out of the one hundred and forty cases of snake-bites reported in 1908, only six proved fatal. The efficiency of this simple remedy has greatly reassured the peasants, who now display no signs of fear in seeking to exterminate this formidable foe.

### ECONOMICAL HOUSE-HEATING.

At the present moment considerable discussion prevails concerning ways and means to bring about smoke-abatement and a purer, clearer air; but so long as the domestic fire-grate holds sway the problem will be well-nigh impossible of solution. Attempts are now being made to educate the Briton towards the use of anthracite, for which special grates are required. In so doing, careful regard is paid to the general feeling for a 'sight of the fire,' as the stoves are provided with special means therefor. The grate is completely enclosed, for anthracite will not burn in an open stove. If preferred, however, gas-coke may be used with the same success. The stove fits into the front of the ordinary grate, and recalls the asbestos gas-stoves once so extensively used despite their deleterious effects upon the health. The front of the grate is glazed with mica, so that the glowing contents within are plainly visible. The stove is lit in the usual manner, or it may be set going with a shovelful of hot cinders drawn from another fire. When

thoroughly lighted, it is only necessary to charge the stove with a supply of fuel, and this will last for twelve or twenty-four hours. The heat which is radiated is intense, and owing to the disposition of the grate, the whole of this comfort is diffused within the room and does not escape up the chimney, which only carries off the harmful products of combustion. There is also a movable bottom, which can be agitated in order to stir up the fire or rake it from the outside. As the stove is completely enclosed, no dust can possibly enter the room, so that every requirement of cleanliness is fully met. Owing to the fuel burning without the slightest sign of smoke, the chimney does not become clogged with partially consumed carbon in the form of soot, so that sweeping is saved. The fire draws in the cold air from the room near the floor, and sheds it into the apartment again from the top, so that a constant current is circulating. Windows can be opened without any fear of draughts or propelling dense clouds of smoke and fumes into the room. As regards fuel-consumption, the stove is exceedingly economical, the cost approximating a penny three farthings per twenty-four hours. For heating a bedroom or sickroom this stove is superexcellent, as it successfully solves the question of maintaining an even temperature without any feeling of 'stuffiness.' Moreover, it overcomes the difficulty of keeping the house delightfully warm day and night; for it requires no attention when once charged, and indeed, when ignited at the commencement of the winter, need never be permitted to go out for weeks at a time. The stoves are of British manufacture, and are prepared in a wide and pleasing variety of designs, so that the most fastidious can be satisfied in regard to appearance.

### SUBSTITUTE FOR PNEUMATIC TIRES.

Under Engineering Notes in the *Times* it is mentioned that a Chicago inventor has recently brought out a device which tests so far made seem to promise will take the place of the pneumatic tire for automobiles and similar vehicles. The essential element is a volute spring, the inner coil of which is attached to the axle, and which is enclosed in a case within the wheel-hub. The axle is stationary and the wheel revolves upon it. The spring-case and the inner periphery of the hub are concentric, and between the two is a series of rollers forming a roller-bearing for the entire depth of the hub. Play for the axle under the compression of the spring is afforded by slots four and a half inches deep in the outer and inner coverings of the spring-case in which the squared end of the axle moves up and down according to load. The claims made for the device from a commercial standpoint are that hard rubber tires cost only about one-tenth as much as pneumatic tires; that they will last several years on ordinary roads, while the life of pneumatic tires is uncertain, but commonly does not exceed one season; and that the volute spring can be replaced in case of breakage as easily as a tire, and can be carried in reserve in a small fraction of the space required for a reserve tire. The outer coil of the spring is about seven inches in diameter, and the inner coil is squared to fit the axle.

### COMBINED TURBINE AND ELECTRIC LOCOMOTIVE.

Mr Hugh Reid, of Glasgow, the controlling spirit of one of our foremost locomotive-manufacturing establishments, recently announced before a Scottish engineering audience that his firm had evolved a new locomotive from which far-reaching results were expected. It is described as the first steam-turbine-electric locomotive. Steam is raised in an ordinary locomotive type of boiler, and is led therefrom to an impulse-turbine making three thousand revolutions per minute, directly coupled to a continuous-current variable-voltage dynamo or generator. This dynamo, in turn, furnishes electric current which drives a series of electric motors mounted on the driving-axles of the engine. The steam, after performing its allotted task, is condensed and returned again to the locomotive boiler. Such an engine, as may be realised, possesses many new and novel features, and it may be mentioned that the evolution of this design has occupied several years of ceaseless experiment and investigation of many abstruse problems. In this latest invention it is claimed that all previous disadvantages have been entirely overcome, and the preliminary trials with the first engine built on these new lines will be awaited with the greatest interest, for its practical success will solve one of the most perplexing problems in traction that confronts engineers and railway shareholders to-day.

### A NOVEL WINDOW-FASTENER.

The ease with which the ordinary type of fastener in sliding-sash windows can be forced from the outside, merely by the insertion of a knife or other thin-bladed tool, is only too well realised. Numerous efforts towards devising a more secure method of fastening the two parts of the window have been made, but the complicated nature and expense of these devices have militated against their commercial development. One inventor, however, has devised a fastener which is certainly novel and fulfils all demands for simplicity. There are two spring attachments mortised into the side of each sash. The top half of the window is worked by a cord which, when pulled, releases a locking device combined with the spring, allowing the window to be pulled down as far as desired. When the cord is released the window locks itself in that position, and can neither be pushed up nor down from the outside. As the locking is accomplished at intervals of a quarter of an inch throughout the whole length of the travel of the sash, a delicate adjustment of the window-opening is possible. The bottom half of the window is operated by means of an ordinary slip-bolt, the only difference being that it has to be pulled back instead of pushed forward to permit of the movement of the sash. Whereas the window can be pushed up and down easily from the inside,

it can only be pushed down or closed from the outside. The device is very positive in its action; and provided it can be supplied and fitted at a low price, comparing favourably with the ordinary type of fastener, it should meet with a widespread demand, for it offers an ingenious protection against those of burglarious intent effecting an entrance through the window.

### THE DEVELOPMENT OF THE ELECTROPHONE.

The success of the electrophone in connection with Lord Rosebery's Budget speech in Glasgow, which was reported verbatim by reporters sitting in a newspaper office in London, was most remarkable. Repetitions have been called for, and already the possibility of the electrophone ultimately supplanting the telegraph in the distribution of news is being discussed. At Mr Balfour's Birmingham meeting the electrophone played a part of pathetic interest. Using it, Mr Chamberlain in his enforced seclusion keenly followed the words from the platform he gladly would have shared. The principle of the electrophone is simply that of the telephone; but as the speaker does not address himself directly to the apparatus, a number of transmitters are specially arranged to catch the sound-waves. In the Glasgow City Hall, for example, a small stand was used for the transmitters in front of Lord Rosebery's desk. Draped with silk, it distracted the attention of no one. For theatrical performances the transmitters are fixed along the line of footlights. In every case all the transmitters are connected to a common circuit, so that the varying electric currents resulting from the vibrations representing human speech act in unison upon the distant receivers. As a precaution against failures due to line faults, two circuits are appropriated for use; and operators are able to switch from one to the other when any imperfection is noticeable. What if both circuits were simultaneously interrupted? The possibility of this is the weakness of the electrophone system. A telegram can be repeated, an oration cannot. But the end is not yet.

### THE LATEST DEVELOPMENT IN WATER-TUBE BOILERS.

During the past few years the generation of steam by means of water-tube boilers, both for land and marine purposes, has undergone extensive application. The latest development in this sphere of activity is the 'Suckling' boiler, which possesses many outstanding features, the principal of which are extreme simplicity in design and construction, perfect circulation throughout every part, and large evaporation per square foot of gross heating-area. Moreover, the large external surface adds appreciably to the efficiency of the boiler, while the great radiation from the brickwork ensures smokeless combustion. The boiler comprises the two cylindrical drums for the water and steam, between which are vertically disposed the series of tubes connecting one drum with the other. Owing to the connecting-tubes being straight, and expanded into the two drums in such a way that their extremities are not constricted, the steam has the greatest facility for its escape from the tubes without any signs of steam-pocketing, which is a serious evil in this class of steam-raiser. At the extremities of the two drums are large tubular connections, the uptake being at the front end (where the hottest temperatures prevail), and the downcomer outside the furnace at the rear end, which is practically cool. Complete circulation is thus obtained. The steam produced is absolutely dry, and as the tubes are set at right angles to the path of the hot gases, the maximum heating-efficiency is obtained. The boiler can be easily cleaned and any tube withdrawn with facility when required. The vertical disposition of the latter offers certain protection against scale or clogging by impurities. The boiler can be used with any class of fuel, and the high figure of 6·72 pounds of water evaporated per square foot of gross heating-surface is recorded. Two of these boilers were recently shipped to South America, and are now working successfully at an Andine silver-mine, sixteen thousand feet above sea-level. Such a test in itself is supreme, for at that altitude the question of oxygen-supply in the rarefied air, necessary to bring about perfect combustion, is one of considerable difficulty.

### A CINEMATOGRAPH TARGET.

'Shoot straight and quickly' has long been regarded as an axiom in military circles, and in order that the marksman may develop this capacity to the fullest degree an ingenious target has been devised. The rifle-range is equipped with a cinematograph, placed behind and above the marksman, the rapidly moving pictures being projected upon a large opaque screen, backed by a recording-screen. The class of pictures projected bring the marksman face to face with a foe firing point-blank, such as an approaching scout or burglar shielding himself behind a desk. The marksman follows the incidents portrayed, and at the critical moment, when the opponent raises or shows himself to fire, discharges his rifle. The idea is to enable the rifleman to take his aim quickly and surely, and, at the same time, to fire before the man pictured on the screen. By means of the tell-tale behind the sheet, the marksman can ascertain whether he has hit his target-foe in a vulnerable part of his anatomy or only inflicted an injury. Owing to the rapidity and life-like movement of the scenes depicted, the straight and quick shooting capacity of the marksman is tested far more severely than is possible upon ordinary ranges with the existing type of moving figures.

*To Correspondents* who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

# THE CUXBERY DIAMONDS.

By B. Paul Neuman.

## I.

GODFREY BULLIATT, M.P., was, as all Eastnorshire knew, the owner of Carples Hall and the big estate that surrounded it. He had not made his money in steel or pork or oil; but he was a substantial, prosperous county gentleman, born into a good social position, and possessed of sufficient wealth to maintain it. He was M.P. for the southern division of the county. The family traditions were Liberal; but Godfrey Bulliatt had refused the Home Rule leap, and had retained his seat by the votes of those who until then had been his political opponents. He was on the whole a popular man in the county. He was a sportsman, had been the best boxer at Eton, had rowed in the Cambridge boat, and was a splendid shot. In the matter of the foxhounds he had been more than liberal, and he was a subscribing president or vice-president of innumerable cricket and football clubs. He could hold his own in any society, and more than once he had entertained Royalty itself at Carples. Altogether, a sound, strong, prosperous man.

In every cup, however, there lurks one bitter drop, and the memory of his first marriage still rankled in his heart. Not that there had been scandal or sensation of any kind. It had been a perfectly decorous but quite unmistakable failure. When he married Louisa Cuxbery every one thought he had done very well indeed, for she was the favourite niece of old Miss Cuxbery, who was not only fabulously rich, but also the possessor of the famous Cuxbery diamonds, worth a fortune in themselves. Louisa was a poor, timid, delicate little thing, with not much to say for herself, and no outstanding accomplishments; but one can't have everything, and the diamonds and investments would cover a multitude of failings. All his perfectly reasonable and legitimate calculations, however, were speedily upset. Miss Cuxbery, to his great delight, invited herself to Carples within three months of the marriage. He received her almost with his royalty manners, and in return she pronounced him an odious creature, and quarrelled violently with her niece, declaring that no one could possibly have married him except for mercenary motives. Within a year the poor little wife had released her husband, as far as she could, from his unfortunate contract, leaving behind her, however, a singularly small and unattractive baby, who was duly christened with great pomp Vivian Godfrey Herbert Tankerton Bulliatt.

After a brief, but still decent, interval, the bereaved husband threw his handkerchief again, and this time he left nothing to chance. Lady Nina Beaukirke was a distinguished-looking young lady, with a splendid figure and an adequate settlement. She was magnificently healthy, and had an excellent temper and a more than passable intelligence. Year by year she bore him a series of record babies, as sturdy and well built as their father and as even-tempered as their mother. As they developed into girls and boys the sporting element soon manifested itself, and the proud father often chuckled when he saw Bertie shaping at the wicket like a miniature Jackson, or Elinor galloping fearlessly round the paddock on her pony.

## II.

When Vivian was thirteen the headmaster of the preparatory school where he and Bertie were being educated came over to Carples one Sunday afternoon.

'What a fine little chap your Bertie is!' he said. 'He's one of the youngest boys in the school, and yet he's made his own place already. His batting is really quite wonderful for his age.'

'What about his Latin?' asked Mr Bulliatt with a smile.

'Very fair, very fair indeed,' replied Mr Lewthorpe; 'quite promising, I should say. Of course, to a boy built as he is, games will always be a great attraction.'

The father nodded. 'And what about Vivian?' he asked.

Mr Lewthorpe's expression immediately became diplomatic. He hesitated for a moment. 'Well,' he began, 'it is really about Vivian that I came over to see you, Mr Bulliatt. He is a dear boy—a dear boy. Mrs Lewthorpe thinks there is no one like him, but he causes me a good deal of anxiety.'

'Why, what's he been up to?'

'Nothing. That's exactly what makes me anxious. We've been boys ourselves, Mr Bulliatt, and we know that a healthy normal boy is always up to something. Now, Vivian is too quiet, too restrained, too correct in his behaviour. It seems strange for a schoolmaster to complain that a boy gives him no trouble; but I assure you I should be quite relieved to see Vivian get into a good, wholesome scrape.'

'So that you could give him a good, wholesome licking, eh?' said Mr Bulliatt, with a laugh that had, perhaps, just a hint of annoyance in it.

'That's the last thing I can imagine myself doing to Vivian. Why, I'd almost as soon cane my Fanny!' exclaimed the headmaster.

They were walking on the terrace in front of the drawing-room, and they took a couple of turns in silence.

Then Mr Lewthorpe spoke again. 'It's against my own interest, of course, but I've been wondering whether school-life is the best for such a boy just at this particular stage.'

'What else would you advise?'

'I think perhaps if he were kept at home for another year with a tutor it might tide over a difficult time. I have known such cases before. A year at that age makes a wonderful difference.'

'Well,' said Mr Bulliatt after another silent turn, 'I dare say you're right. At any rate we'll try. But I'm afraid he'll never make a decent English schoolboy. He's never been like my other boys. Why, a few months ago an old aunt of a sort sent him a present of a box of dolls. Fancy! A boy of his age! He simply took them and began playing with the nursery children, and showing them the dolls. It isn't natural. Still, we'll try what you suggest. As you say, a year may make a lot of difference to him.'

III.

A year went by, and others in its train; but the contrast between Vivian and his half-brothers only became more sharply defined. They went to Eton and upheld the family reputation for sportsmanship. He was so obviously unfit for the hurly-burly of public-school life that, instead, he was sent to read with a clergyman in Yorkshire. Bertie at fifteen was taller, heavier, and far stronger than his elder brother, who grew up a short, slight, dapper young man, with a high, rather narrow forehead and pale-blue eyes. Even about his best physical features there was nothing characteristically virile. His eyebrows were beautifully arched, his lips were finely modelled, and his hair was soft as silk. He was not stupid; indeed, he was distinctly imaginative, and he developed a decided talent for drawing. But in the ordinary branches of school education he was backward. He went to Oxford, however, in due course, and with careful coaching managed to pass his examinations just about the time that Bertie covered himself with glory by scoring 80 not out, and saving the match against Harrow.

On his twenty-second birthday Vivian was astonished to receive a cheque for one thousand pounds from Miss Cuxbery. When he was about twelve he had been invited to spend a week with the old lady, and a year later she had sent him the unfortunate dolls that had aroused his father's indignation. From that time till the date of the cheque she had taken no further notice at all of him or of any of the family, and six months after the sending of the one thousand pounds she died suddenly. Her will contained no reference to the Bulliatts. She seemed to have hunted out her remotest family connections, and left all her property among them. As for the famous diamonds, they were not even mentioned in the will. Some of the nearer relatives talked of opposing probate on the ground that the old lady must have been of unsound mind, and even Mr Bulliatt went up to town and consulted his solicitor; but it soon became apparent that they had not a leg to stand upon. Miss Cuxbery was eccentric, had a bitter, cross-grained humour, and was violently prejudiced; but her mind was clear and vigorous to the very last.

So far, Vivian, though certainly a disappointment, had given his father no serious trouble. With his step-mother he had always been a favourite, for to the second family, especially to the little ones, he had shown himself an exemplary elder brother. But in the midst of all those strong, active, energetic people he had appeared a singular, pathetic figure, a negligible factor in the sum that represented the Carples household. And then quite suddenly, in a moment, the negligible factor became significant, and the habitually weak stood revealed as the unexpectedly strong.

IV.

Luncheon was over, and Mr Bulliatt, according to custom, had gone to his study, lighted his pipe, and taken up the *Times* for the second time that day. In the early morning he read the news; luncheon gave him fortitude to tackle the leaders. He had just found the right page when a tap sounded on the door. He laid the paper down on his knee and shouted a masterful 'Come in!'

He was astonished to see his eldest son. It was very seldom indeed that Vivian took the initiative at all, even in the small domestic affairs. There was, too, an unusual expression on the young man's face, an expression which his father was at a loss to interpret.

'Can I speak to you for a moment, father?' he said.

As he stood there, the light from the opposite window falling strongly upon him, his poor little frail figure showed up with insistent weakness, and the old irritation stirred in Mr Bulliatt's mind. That this should be his eldest son, his heir! Then he reminded himself that the boy was not to blame.

'Certainly, Vivian,' he answered, and pointed to a chair. 'Sit down, my boy. What is it?'

The young man sat down, and then paused for a moment. He took out his handkerchief and wiped his forehead, gave a rather foolish little simper, and said, 'I've been thinking that I should like to marry.'

Mr Bulliatt was certainly startled. Vivian looked so absurdly young that it was really not easy to take such an announcement seriously. After all, though, the boy was right. He was more than twenty-two, quite time enough to be thinking—at long range, of course—of matrimony. So in a half-jocular and wholly good-humoured tone Mr Bulliatt said, 'And who is the fortunate young lady?'

Vivian flushed a rich red, but his voice sounded stronger and more manly. 'Miss Flagge,' he said.

Miss Flagge was the daughter of a former curate at Carples parish church, who had now a small living in Wiltshire. He had neither fortune nor good family to recommend him. The young lady herself had taught some of the Bulliatt children the elements of music.

Mr Bulliatt's first emotion was not so much indignation or anger as amusement. Miss Flagge to marry the heir of Carples! It was too absurd!

'A very pretty little idyl,' he said with a great guffaw. Then he glanced at Vivian and saw that his face had set into a quite unfamiliar expression.

'How long has this nonsense been going on?' he ended, speaking sharply.

Vivian answered in a curiously deliberate voice. 'We have only been engaged since yesterday week, but we have meant it for more than a year.'

'Oh, have you?' said his father, now seriously angry. 'Well, then, you'll please understand that I won't have you playing the fool like that. Do you hear?'

He waited for an answer, and Vivian in a very low voice said, 'Yes.'

'Very well'—and Mr Bulliatt turned with an air of relief to his paper—'there's an end of that, then. I'm glad you told me. Perhaps the best way will be for you to go abroad for a few months. I'll think it over. And I'll write to Flagge.'

His tone implied dismissal, but, to his secret astonishment, the young man did not stir. The squire had never before seen Vivian in this mood; he was still more astonished to hear him say, 'I would much rather you did not write.'

'I shall do exactly what I think best,' exclaimed Mr Bulliatt with emphasis. 'I don't want to pursue the subject at present. I'm very busy just now.'

The hint was quite broad enough, and Vivian took it.

V.

Three days after this interview Vivian Bulliatt married Laura Flagge. She was a bright, sensible, good-looking girl, and really fond of him. It was a runaway marriage, and the curate did not get Mr Bulliatt's letter of polite reproach and warning till his daughter had actually left his roof. He read it, in fact, just about the time when the squire of Carples was digesting the stiff little note in which Vivian apologised for disobeying the parental commands.

'DEAR FATHER'—it ran—'I am afraid you will be very angry when I tell you that by the time you read this letter I shall be married to my dearest Laura. If you only knew her I am quite sure you would think me wonderfully fortunate. I think perhaps it will be as well that I am not to go on living at home, for I know that I have always been a disappointment to you. I shall miss the children very much, and I think they will sometimes miss me in the nursery. I have left the box of dolls. Clem and baby will like to play with them. Give my love to mother. I hope you will both forgive me, even if you do not approve of my marriage.—Your affectionate son, VIVIAN G. H. T. BULLIATT.'

Mr Flagge was dismayed and tearful, Mr Bulliatt furious and apoplectic; but both were, and knew themselves to be, helpless. Perhaps in his secret heart the ex-curate was not altogether inconsolable. As for the squire, he relieved his feelings by having all Vivian's personal belongings immediately packed up and despatched to the address given in the letter: 5 St Rollox Terrace, Streatham.

'Everything, mind,' he exclaimed—'books, and painting-things, and his fishing-tackle. Don't leave anything out.'

A minute or two later, after glancing again at Vivian's letter, he opened his study door to shout out, 'And don't forget that box of his with the dolls. They'll be in the nursery, I expect.'

The young couple had settled down in a comfortable little furnished flat on Streatham Hill. Besides his one thousand pounds, Vivian had saved about one hundred and fifty pounds out of his liberal allowance, and he had strong hopes of making money by drawing. 'A man he knew' had told him how easy it was to get such work, and how well paid it was. The one thousand one hundred pounds would keep them in quiet comfort for three or four years; and by that time, even if his father proved obdurate, he would be earning enough to support their modest establishment. Laura, who had a better idea of the value of money, fully believed that Mr Bulliatt would speedily relent, and also had a good deal of faith in her husband's abilities as an artist. Still, she soon appointed herself chancellor of the exchequer, and did her best to save their slender capital.

VI.

Four years passed, and the situation remained very much what it had been. Bertie and his younger brothers and sisters grew up big and strong and healthy, and in a large, florid way handsome. The squire and his wife looked hardly a day older, though he had fought and lost an election.

As for Vivian and Laura, they still lived in their little flat at Streatham. But their capital, in spite of great care, had shrunk by half, while the number of mouths to be filled had actually doubled. A little Godfrey and a tiny Laura increased at once their joys and their anxieties. Vivian had long since learned by hard experience how fallacious were the hopes fostered by 'the man he knew.' But he had stuck to his work with surprising tenacity, and the discipline of disappointment was developing in him other qualities than mere draughtsmanship, though of late even in that direction gleams of encouragement had come. The *Graphic* had taken two drawings, and some really clever little cricket caricatures had gone off quite readily. Still, the money he earned was only a trifle, and he was consumed by anxiety as to the future. He had made several overtures of reconciliation to his father, and so had Mr Flagge on his behalf; but all these had been repelled with contemptuous silence. Unfortunately his wife's health had been unsatisfactory, and she had been obliged to undergo a severe operation. He would not hear of her going to a hospital, and the expenses of the nursing-home and her convalescence had been a cruel drain on the fast-dwindling little capital. Besides, her illness had been a long, dragging affair, and he owed their own doctor a long bill. Even now it was doubtful whether her recovery would be complete.

Still, there were rifts in the clouds. Husband and wife were devoted to each other, and the fact that her life had been spared made up for much.

Then the children were a perpetual joy; and, as Laura said, he was worth half-a-dozen nurse-girls. Another source of pleasure was the occasional visits of Bertie and of Elinor, his eldest half-sister. They were indignant at the harsh treatment meted out to him, and they brought many messages of affection from the younger ones, who still remembered their old playfellow. To them Vivian put on his most cheerful air, and they had no idea how badly things were really going in the pretty little flat, though of course they heard of Laura's illness.

One bright June morning Dr Steel looked in on his early rounds to tell Vivian that his wife would be back in three days' time. 'And, my dear fellow,' he went on, 'do try to put on your brightest face. Cheerfulness will be more to her than medicine. You aren't looking very sprightly now.' As he spoke his heart smote him, for he had a shrewd idea how the land lay.

'Just wait a moment, will you?' said Vivian, and went out of the room. He came back almost at once with a small parcel in his hand. 'Look here, doctor,' he began, 'you understand this sort of stuff, I know; you said it was a hobby of yours. I wish you'd tell me if you think they're worth anything. I don't care about keeping them, but I don't want to throw them away.' He opened the packet. Inside were five or six rings, a couple of scarf-pins, three sets of sleeve-links, and some studs.

Dr Steel took them to the window and looked at them carefully. 'I'm only an amateur, you know,' he said; 'but these'—he held up two of the rings—'look to me pretty good. If you like to trust me with them I'll get you an offer for the lot.'

Vivian's face brightened. 'I'd be very grateful if you would,' he answered. 'I shouldn't know in the least where to go.'

'You mustn't expect anything very grand; they are all small stones.' This was the doctor's good-bye, and he saw the brightness die out of Vivian's face. 'I'm afraid he is getting near the end of his tether,' he said to himself as he jumped into his victoria.

VII.

On the following Friday afternoon Dr Steel called at St Rollox Terrace on a double errand. He was the bearer of an offer of thirty pounds for the two rings which he had picked out, and he was anxious to see Mrs Bulliatt, who was expected home about five. It was five when he rang the bell. Vivian had gone to fetch her, and they had not yet arrived.

'Where are the children?' the doctor asked the little servant. 'I may as well have a look at them.'

'They are playing in the dining-room,' she answered, and took him in.

The children were both of them lying on the sofa, and between them sat a group of old-fashioned dolls. Godfrey, who was very much like his mother, held an extra big doll on his knee.

Dr Steel knelt down, and with sundry digs and pokes soon had both the children laughing. He laid hold of the big doll on Godfrey's knee.

'Hullo!' he exclaimed; 'what's her name?'

'She's the Keen,' said Godfrey, who was very forward. 'She's got a c'own and g'ass eyes.'

'So she has,' said the doctor, and began to squint and frown at her in the most extraordinary way. 'And look at her glass beads too. Don't they glitter? Why, I declare, they've all of them got glass eyes and beads round their necks too!'

'G'ass eyes! g'ass eyes! g'ass eyes!' shouted Godfrey.

Dr Steel pulled out a pocket-knife, deliberately prised out one of the Queen's eyes, and looked at it very carefully.

'What's 'oo doin'?' shrilled Godfrey.

'She's got a sore eye, and I'm putting it right,' said the doctor, replacing the eye in its socket.

Just then the door-bell rang loudly, and a minute or two after Vivian came in.

'She's lying down in the next room,' he said. 'She does seem wonderfully better. We'll give her a minute or two, and then we'll go and see her.'

The doctor hardly seemed to be listening. 'I say, where did you get those rum-looking dolls?'

'An old aunt, or great-aunt, sent them to me years ago. Why, what makes you ask?'

'What sort of a person was she?'

Vivian laughed. 'Enormously rich and frightfully eccentric. She left about a quarter of a million, and she ought to have left the Cuxbery diamonds; but they seemed to have vanished. No one knows what has become of them.'

While this little conversation was going on, Dr Steel had been stripping the dolls of their eyes and ornaments. Now he held out his hand with a pile of the glittering beads, and answered Vivian's last remark. 'I do,' he said; 'here they are, the Cuxbery diamonds, and worth ten thousand pounds if they're worth a penny! Let us go into the next room and administer the tonic.'

## SCOTCH MIST.

THE Northern hills are drear and dun;
They hide their heads in clinging mist,
Their sides are scarred and shadow-kissed,
Till sweeps the bright broom of the sun,
Range over range,
And, lo! the change!

The Northern men are like their hills;
They hide their hearts where few can reach,
They spike their souls with sharpened speech.
But he who with true purpose tills
Can pierce the mould,
And find rare gold.

# THE SOLITARY GUEST.

By SUSAN BALLARD, Author of *The Open Door*, &c.

IN FIVE CHAPTERS.—CHAPTER I.

IT is a well-known fact that it is much easier to fall in love when on the sea than when on the land. The reason of this is perhaps not very difficult to discover; there are more opportunities for intimacies in seven days on the sea than there are in seven years of an ordinary life on the land. The chairs drawn up side by side in the morning, the tramps up and down the deck in the afternoon, the long evenings spent in hanging over the ship's side watching the starlit sky—all these tend to produce a sympathetic and confidential frame of mind; and it is but a step further to fall in love and be engaged.

The cynic is apt to say that engagements are made on the sea to be broken on the shore; but there was no such melancholy ending to the engagement between Leslie Howard and Sibyl Moreton. From the first experienced hands at life on board ship looked after them with a smile as they tramped the deck together, and pronounced it to be 'a case.' Sibyl and her brother were making a tour of the world for pleasure. They joined the ship at Colombo, where they had done some sight-seeing, and on the ship they met Leslie Howard, with whom they at once formed a friendship. Leslie Howard was in the diplomatic service, and was going to investigate a little into the state of affairs in the Far East—that Far East which is so rapidly becoming the Near East.

By the time that their ship had reached Shanghai the young couple had quite made up their minds that they were intended for each other; and the voyage from Shanghai to Yokohama was occupied with endless discussions as to when, where, and how their marriage was to take place. Leslie Howard could see no possible reason for postponing the marriage till their return to England. It was ridiculous, he said, to think of Sibyl going sight-seeing with her brother in Japan and home through Canada, leaving him to go sight-seeing all alone in China. Of course his happiness depended upon his having her with him. Why not have the marriage at once? The only person who had any right to control Sibyl's affairs was her brother, and he was there with them, ready to give his blessing at any moment; and as for his own people, his father had been worrying him for several years to get married, and would be simply charmed to get such a daughter-in-law.

'Well, it rests with yourself,' said George Moreton to his sister. 'It is for you to decide, my dear girl. If you like you can say good-bye to Howard for a few months, and come along with me; in which case I promise you a regular St George's, Hanover Square, sort of marriage, and you will doubtless be blessed with a perfectly uncountable number of salt-cellars and clocks, and whatever happens to be the fashionable wedding-present of the moment. Or if you like you can marry Howard now; but in that case you must not count on the salt-cellars and clocks, for by the time you get home every one will have forgotten about your marriage; no one gives presents to a bride of six months' standing.'

'I don't mind about the salt-cellars and clocks,' said Sibyl; 'but there is something so dreadfully gloomy about being married without a single friend present; and I always faithfully promised Mary Davenant that she should be my bride's-maid; and really I don't see any use in getting even a wedding-dress!'

'No use in the world,' said George promptly. 'There will only be Howard and myself present, and you are surely not going to dress up in satin and orange-blossom for us?'

'Oh George,' said Sibyl, almost in tears, 'do you really mean to say that I am to be married in a common everyday dress and without a single bride's-maid? It is too horrid! No; I believe I will tell Leslie that we must wait till we get to England, and have a real, proper wedding.'

[*All Rights Reserved.*]

'All right, my dear,' said George cheerfully; 'then you and I will wend our way home across Canada. And if we have any luck we ought to get a salmon or two there; there is said to be fine sport on the rivers. And Leslie can go and poke round Pekin. But supposing he finds some delightful young woman in Pekin and changes his mind?'

'George, you are horrid! Leslie would never, never change his mind. How can you think of such a thing? I do think you might try to help me to make up my mind, instead of just teasing me.'

'Try to help you to make up your mind!' said George. 'Goodness me! that's what I have been doing for the last hour. I have gone into every detail that I thought could influence you in any way. Hanover Square, wedding-dress, bride's-maids, salt-cellars, clocks, wedding-presents are in the one scale; and against them you must weigh Leslie Howard. Now, is Leslie sufficient in himself to turn the scale? No, stop. Perhaps I ought also to mention the fact that Leslie may be counted upon to let you shop to your heart's content in Pekin, and you may pick up things that will compensate for the salt-cellars and clocks.'

As a matter of fact, it was but little use for Sibyl Moreton to weigh in her mind the joys of a gay wedding in London in contrast with the loneliness of one in Yokohama; for Leslie Howard had quite made up his mind that he was going to carry Sibyl off with him, and it was impossible for her to withstand his persuasions. By the time that the ship reached Yokohama an immediate wedding had been fixed on.

'We must find out at once where we are to get married, Sibyl,' said Leslie. 'I expect it will have to be at the Consulate.'

'The Consulate!' exclaimed Sibyl. 'Oh Leslie, do you mean a dreadful, stuffy sort of place like what George and I went to once in Italy? Why, I should not feel as if I were being married at all unless I had a service in church. It would be more like going to prison than getting married to go before a consul. Do see if there is a church where we can get married without going to a consul.'

After a couple of days in Yokohama Leslie was able to give Sibyl the glad news that she could be married in a church, and that a visit to the Consulate was not necessary. 'It is hard on you, darling,' he said, 'to have such a hole-in-the-corner sort of affair, no bride's-maids, no music, no friends; but never mind, we will have no end of a good time in China together, and you shall buy just whatever you like in the curio-shops in Pekin.'

'Rash man!' laughed George. 'Fancy telling any woman that she might buy whatever she liked! However, Sibyl, I am glad for your sake that there is a church licensed for marriages here, for I own that there is something dreadfully criminal-like in going before a consul. I wonder what sort of a building the church is. There must be some verger-sort of person. I will get him to put up some decorations in the way of flowers so as to hide the fact that there are no friends present.'

The day appointed for the wedding arrived, and Sibyl Moreton and her brother returned to Yokohama from visiting some of the celebrated places of Japan. On entering the hotel the first person they met was a young Captain Compton, whose acquaintance they had made on the ship; they were glad to see any face that they knew, and he hailed them with joy. He was a pleasant, friendly man; but the Moretons would not have been so pleased to see him had they known that his regiment in Hong-kong had intimated to him that it would be glad to be relieved of his presence. Captain Compton had a genial, pleasant manner, but an unfortunate habit of running up bills and not being able to pay them. He was now staying in Yokohama in hopes that he would find some light but lucrative employment which would give work suitable to a gentleman. He was charmed to see the Moretons, and accepted with great alacrity their invitation to dinner. Before the evening was over he had been invited by Sibyl to be present at her wedding.

'I am awfully glad that I can be married in a church, and that we won't have to go to a Consulate afterwards; but just think of it, Captain Compton, an absolutely empty church, George to give me away, Leslie to marry me, a clergyman to perform the ceremony, probably a verger-sort of person, but not a single, solitary guest. Isn't it dreadful?'

'Quite dreadful, Miss Moreton,' said Captain Compton, 'and if I could transform myself into half-a-dozen beautiful ladies, gladly I would do so. But if the presence of a solitary guest in the person of a black-coated man will help, I shall be charmed to be your solitary guest.'

'Do come!' said George. 'After the ceremony the happy couple will go off to Miyanoshita, and you and I will come back to the hotel and have a rattling good wedding-lunch all to ourselves.'

Poor Sibyl Moreton! it was somewhat hard on her that of all her dozens of friends not one was present when she entered the church in her fresh young beauty; but as she drove away with her husband she declared that she did not miss them at all. 'I am just as happy as I can possibly be—as happy as if I had had six beautiful bride's-maids behind me and a hundred friends behind them. Poor, dear old George! I am glad that he has got some one to lunch with him. It would be horrid for him if he had had to sit down all alone.'

---

### CHAPTER II.

A MAN was leisurely eating his breakfast in a third-rate London boarding-house. Everything round him was shabby, and the breakfast before him was of the most unappetising description. Time had not dealt kindly with Captain Compton. It was evident from his appearance that the light but lucrative employment

which he had sought in Yokohama had not been forthcoming. As he sat at breakfast he listlessly turned over the pages of the daily paper, his eyes passing down the columns in an uninterested way till suddenly a short paragraph seemed to rivet his attention. He read it again and again, till at last, laying down the paper, he rose to his feet.

'By Jove,' he said, 'that's rum!' A few minutes afterwards, dressed as carefully as his very shabby wardrobe would allow of, Captain Compton was to be seen proceeding in the direction of the City. Arriving at the door of a set of chambers, he asked the clerk if Mr Compton was at home, and then, opening a door, he walked into a farther room. 'Hallo, Tom!' he said, 'how are you?'

The person thus addressed looked up with no very pleased expression. 'What has brought you here, Dick?' he said severely.

'Oh, don't be afraid!' laughed Captain Compton. 'I have not come to borrow money. Do you happen to have a landed-gentry book or peerage at hand?'

Mr Compton, his brother, pointed with his pen to a large, red book on the table. 'There you are,' he said briefly.

Captain Compton sat down with the book in front of him. There seemed to be endless people of the name of Howard in it, but in course of time he found what he wanted. Sir Leslie Howard had an only son Leslie, who had married Sibyl Moreton, by whom he had two children. The residence was Grangemuir. By careful study Captain Compton also found out that in the event of the death of the younger Leslie and his son, a distant cousin, Montague Howard, would be the next heir. 'Yes, my good sir, I know you, and a precious scamp you are,' said Captain Compton to himself; and then, shutting the book, he turned to his brother.

'I say, old chap, you might do me a good turn. It is just a bit of information that I want, and that a lawyer like you can easily give me. Look at this; and, so saying, he pulled out of his pocket the newspaper paragraph that had arrested his attention that morning. 'According to this statement,' he said, 'the marriages that took place in the church in Yokohama were not legal ceremonies.'

'Good heavens, Dick!' interrupted his brother, 'you don't mean to say that you were married in Yokohama?'

'Not I,' said Captain Compton; 'make your mind quite easy on that score. But a man I know was. Though I was present at his marriage he has treated me abominably—cut me, in fact.'

'A good many people have found it necessary to do that,' remarked Mr Compton.

'Well,' said Captain Compton, 'I don't believe Leslie Howard knows that his marriage was illegal. It seems to have only just been discovered that there was anything wrong with the church license. But what I want to know, Tom, is this: would all marriages that took place in that church be illegal? You are a lawyer and understand those things, which is more than I can.'

Mr Compton read the newspaper cutting carefully through. 'It is quite clear,' he said. 'The treaty revision abrogated the church's license; but this was not fully understood, and marriages continued to be performed. All marriage ceremonies after a certain date were illegal ceremonies unless followed by a marriage before the consul. Did your friend go to the Consulate?'

'No,' said Captain Compton, 'that's just the point; he did not. Do you mean to say, then, that his children are illegitimate?'

'Why, of course, if the marriage is void the children are illegitimate. A very hard case; but it will probably be put right by an Act of Parliament, though it may take a little time to get it put through.'

'Well, thanks, old chap, that's all I wanted, and you can never again say that I only come to borrow money. So good-bye to you; and, so saying, Captain Compton went off.

The next afternoon the landlady of the 'Boar's Head' at Hedgeham might have been found pouring forth the local gossip to a newly arrived guest. 'And a nice, affable gentleman he was,' she reported in the kitchen on her return from her talk.

'It's a beautiful part of Surrey, sir,' she said to her guest, 'and I am sure we should be thankful that our lot is laid here. I suppose you are from London, sir, a nasty, grimy place that I never could abide, and I pities those that has to live in it. Were you asking about the properties in this neighbourhood? Have you seen Grangemuir, where Sir Leslie Howard lives? That's a beautiful spot. You should ask leave to walk through the park.'

'Is the young Mr Howard at home?' asked Captain Compton.

'No, sir, he is not; he has gone to South Africa on some Government business, and there are only Sir Leslie and Mrs Howard at Grangemuir. She would have gone with her husband if it had not been for the old gentleman and her two children.'

As the landlady spoke a carriage was heard rolling along the village street. She ran to the window, and Captain Compton stepped up behind her. Yes, there in the carriage sat Sibyl Moreton. She looked a little older than when he had last seen her in the empty Yokohama church, but she was a happy-looking, pretty woman. Opposite her sat two dear little children.

'There they go, bless their hearts!' said the landlady. 'The old gentleman is that fond of little Master Leslie that he can hardly bear to let him out of his sight.'

Captain Compton stood looking after the carriage. 'Upon my word,' he said to himself, 'it's precious hard on them, and I wonder how she will take it. To suddenly find out that the man whom you thought was your husband was not your husband, and that your son and heir is heir to nothing at all, instead of being heir to a title and a place, is enough to take the spirit out of any one. I suppose that

they will get an Act of Parliament to put the whole matter straight; but if Leslie Howard were to die while he is in Africa how would that affect the matter? Could they legalise his marriage after his death? I wish that I had asked Tom about that point. However, it's all one to me as long as I get a little ready-money out of the matter;' and meditating deeply on what line he should take in the matter, Captain Compton left the 'Boar's Head' and proceeded in the direction of Grangemuir.

*(To be continued.)*

# THE NEW BOY.

By GEORGE A. WADE, B.A.

THE new boy at any great school is a constant factor of interest and delight. For many generations he has been the recognised butt of the joker, the target of the scornful, the one fellow whom even meek Sandy Bliffins of the lower fourth could poke fun at, mimic, and lead into trouble without much fear of serious consequences.

The new boy has been the head and centre of innumerable stories, of countless anecdotes, of strange and varied experiences. He has been the recipient of traditions immense, the fellow introduced to extraordinary customs and ways, many of which have really belonged peculiarly to the school, but more of which have not! To write the history of the new boy at most of our public schools would be to complete a document that has long been wanting completion, one that would be full of intense interest, of unique attraction, and of poignant and thrilling matter.

The new boy sometimes turns out more than a match for his opponents, tormentors, and scorners, even at such places as Eton and Winchester, let alone at Little Pedlington Grammar School or at the Slush-cum-Mud Collegiate Academy. As witness the following story, recounted of a new boy at Henry VI.'s famous school near Windsor.

His very name proclaimed him the son of a well-known man who had made a fortune from soap; hence the quickly formed determination of the Honourable Reginald Clarence Fitz-Clarence to take a rise out of him there and then, and to provoke a good laugh from the fellows by his witticism.

'I say, youngster,' drawled out the Honourable one lazily, as he stood near the new boy with several others, 'what's your name?'

The new boy told him quietly.

'And your father's So-and-So, the soap-maker, isn't he?' went on Reginald.

'Yes,' answered the new boy.

'Then why the dickens didn't he make *you* a soap-maker instead of sending you here to Eton?' asked the Honourable.

The new boy blushed, but said nothing for a minute. And the crowd smiled. Then, a little later, the new boy turned to the son of the baron. 'May I ask your name, please?'

'Confound your cheek!' said the other. 'Well, it's the Hon. Reginald Clarence Fitz-Clarence, if you want to know.'

'And *your* father—what is *he?*' inquired the guileless one.

'He's a gentleman!' replied the elder boy haughtily.

'Indeed? Then why didn't he make *you* a gentleman?' naïvely put in the new boy.

The shouts of laughter at Reginald's expense from the group of boys around made that youth wild, and he strolled away in high dudgeon. The new boy had come into his own without a doubt!

The new boy has often a trying time for the first night or two. His bed has a strange knack of falling down, and his clothes vanish as if by magic. Then he usually finds himself going on all kinds of extraordinary errands, the absurdity of which he only recognises when he sees their results.

'Hurry up, Slopperdash!' sings out an older youth at Christ's Hospital to the arrival of yesterday. 'The house-master says you have to go at once to the cook in the kitchen and ask him to measure your mouth for a new spoon.'

Slopperdash, with the full glory of his new blue coat and yellow stockings, knowing that he will need a new spoon, and half-guessing that it will have to come from the kitchen, sees nothing strange in the errand, so he goes jauntily to see the head-cook. That worthy, having had some hundreds of boys come on the same mission, gravely regards the waiting Slopperdash after receiving the message, and then nods sagely and tells him to open his mouth as wide as possible.

Little Slopperdash meekly obeys, and gives it such a stretch that the group of lads waiting outside the window to enjoy the fun shriek with laughter. The cook tells the new boy that he will see it is all right, and off goes Slopperdash, to meet with a yelling crowd, whose hilarity and remarks soon inform him of the fool's errand of which he has been the victim.

The new boy looms great in our fiction about the schools. His ideas of the place, his experiences, his words on the subject all play a notable part in several famous novels. There was the arrival of Tom Brown at Rugby, which has become well known to all readers of that splendid boys' book. The new boy of to-day at that school sees the same old archway before him as he drives up the High

Street, the same schoolhouse, the same quadrangle. And probably his very words are the same as Tom's: 'So this is Rugby!'

Then there is detailed for us the new boy at Harrow, in Mr Vachell's fine story of *The Hill*. There is many a new boy, indeed, who arrives at a big school and is staggered by the same mute witnesses of his family's prowess, those Verneys of past times that flame on the new boy from the walls and carvings, which remind him how much is expected of him and what a reputation he must of necessity keep up. Think of the Lyttelton who goes for the first time to Eton, the Phillimore who newly comes to Westminster, the Fiennes who descends at Winchester to begin his school-life there. Imagine what it must feel like to such boys who see the names of ancestors for three or four hundred years back adorning the blackened walls of the old schools; who remember what a glorious part these men have played in England's history; who recognise the legacy bequeathed to them, the latest representatives, at the much-loved seat of learning!

It is not quite unknown for the new boy to be frankly impudent. But usually such cheek is sternly repressed, and severely paid for later on. It is not every youth who can carry off his start like the Brighton College beginner who went on the first afternoon after his arrival to watch the eleven practising at the nets. And as he watched he spoke aloud his opinion of the bowling frankly and fully —and most cheekily.

An elder pupil of the sixth surveyed him with astonishment, mingled with amusement at that same impudence. He regarded the scorner with a piercing eye. 'Perhaps you think you could bowl better yourself?' he said with an unrestrained sneer.

'Well, there's one thing certain,' replied the cheeky new one, 'I couldn't bowl worse.'

In order to take him down a peg the lights of the eleven set him on to bowl there and then when they heard the story. But there were dismay and amazement in the camp when the new boy upset wicket after wicket, and laughed aloud merrily at the looks of the vaunted sixth as he did it.

Then suddenly it dawned on the intelligence of the captain that, after all, here was a wondrous find of the Brighton College eleven for the coming summer. 'What's your name, youngster?' he asked as he came up to the new boy.

'Woods,' ejaculated the lad, with a grin that seemed to light up his whole face. 'Samuel M. J. Woods.'

That new boy's name has travelled with his fame much farther than Brighton since that day; and his smile—and some friends say also his delightful 'cheek'—is just as potent a factor on the cricket-field as ever.

How often the soul of a new boy has been harassed by the dread of that first singing can never be told. Nor how he has suffered from the woes of early fagging. It is simply astounding how the new boy delights the fag-master for a day or two by his strict attention to every little order and detail; and the fag-master fondly imagines that he has indeed found a treasure in Jobson mi.—a fag in a thousand. But, alas, what a different story it seems after about a fortnight! How strangely Jobson mi. seems to have altered! What 'hidings' he gets, what boots are thrown at him, what imprecations are hurled after him as he struggles along trying to do as little as possible in the way of fagging, and doing that little as badly and carelessly as it can be done—according to his master's account!

The new boy may have no musical voice at all, but he has to sing or wail aloud all the same at most schools when the fateful night comes. After practising for two days that touching ballad, 'When father started taking photographs,' in season and out of season, in the vain hope of doing it justice, the boy at Westminster ascends the rickety table, with the still more rickety chair on it, upon which he must sit and sing with a lighted candle in his hand. He has hardly opened his mouth before some unseen auditor requests him to 'Sing up!' whilst he is paralysed by hearing another boy at the very same moment telling him, 'Don't make such an infernal row, Traddles, for goodness' sake!'

Then yells of 'Get down!' float to his disordered hearing, whilst at the same time somebody is shouting, 'For conscience' sake get on with it, kid!' The upshot of it all is that the new boy gets flustered, stops, and is immediately assailed by a shower of biscuits and cries of 'Go on!' 'Encore!' 'Hurry up!' &c. If he is wise he will sing the touching ballad through as quickly as possible, regardless of interrupters and encouragers, and so pass through the ordeal once and for ever.

The new boy has his vanities and pride as well as his troubles and scorns. When he goes with his fond mother at Harrow, immediately after his coming to the Hill, to buy that wonderful straw hat at the appointed shop in the village, it is doubtful whether he feels more proud or shy as he marches up the street wearing it for the first time. It is a curious piece of headgear indeed, that straw hat—as flat as a pancake, with a brim as wide as a cowboy's sun-hat; and, with that terrible elastic fastening it *behind* the boy's head, what wonder if the new boy scarcely knows whether he is standing on his head or his heels!

The new boy, too, has a novel way of putting his foot in it, as they say, from the very first. He accosts masters and officials with a nonchalance and cheek that the more experienced youth simply marvels at. They tell you with glee of the new boy at Charterhouse who had brought his bicycle with him. He met the then 'head,' the late Rev. Canon Haig-Brown, on a private path in the school-bounds.

'Please, sir,' said the boy, 'may you ride a bicycle on this path?'

The genial smile of the 'head,' so well known to old Carthusians, broke out as he gazed at the innocent youth before him. With that quick retort of his, Haig-Brown answered, 'Yes, *I* may; but *you* mayn't!'

Even more awe-inspiring was the advent of a new boy once at Marlborough. He was proceeding thither by train, and in the carriage was a very kind-looking and talkative gentleman, who got into conversation with him. The boy opened his mind to the other traveller very freely, telling him where he was going, and making various comments upon the school, and upon what he meant to do.

'And you think you'll like Dr Farrar?' queried the kindly gentleman with a smile.

'Oh, I dare say we'll get along all right together,' was the off-hand reply. 'I'm told old Farrar's an awfully decent chap if you don't rub him up the wrong way. And I reckon he'll be a jolly smart master, either Farrar or anybody else, who gets over me!'

The gentleman laughed heartily with him at the remark, and bade him good-bye warmly as they parted at the station. But when, next day, the new boy saw the headmaster stand up in front of all the school, and met his eye, he nearly had a fit there and then. For this was the same gentleman to whom he had been confiding his views in the train about 'old Farrar' and similar interesting Marlborough worthies!

The new boy, as everybody knows and admits, is usually at a serious disadvantage. His innocence, his ignorance, his position, lay him open to special failure or unexpected downfall. He needs more assurance, more courage, more resolution, more 'cheek,' than happen to be bestowed on most young boys. Hence he often gets his nickname from some folly or mistake of the early days; and as that nickname sticks to him like a leech all through his career at Repton, Haileybury, or elsewhere—indeed often through all his life—it may prove a serious factor in his career.

'Where's he come from?' asked an older youth about a new boy at Uppingham.

'Melton Mowbray,' was the answer.

'Oh, then we'll christen him "Pork Pies,"' remarked the other.

They did, and 'Pork Pies' he remained to the end of the chapter. A friend and I saw him years later standing on the platform of Melton Mowbray Station as we passed through in the London express. We put out our heads, men as we were, and shouted delightedly 'Pork Pies' with all our might. He saw us, smiled gaily, and waved his hat in greeting.

It was our last glimpse of a kind heart. Two years afterwards he died. But to the end he was ever 'Pork Pies' to all his schoolfellows.

The new boy sometimes wins immortal fame because of his special newness. When Cheltenham College was first opened the boy who came strolling into its yard as its initial pupil was a lad named James. When his name was enrolled he little thought what an honour was conferred on him, any more than he thought what honour he would bring to the school of which he was, in truth, the first new boy. But to-day, though Lord James of Hereford is justifiably proud of many things in his splendid career, there is nothing that gives him so much pleasure as to remember that he was in deed and in truth the first new boy of Cheltenham's great school.

Or it may be that the new boy has a notable honour thrust upon him unexpectedly. This was the case with Lord Schomberg Kerr, who arrived at Glenalmond on the 3rd of May 1847, by mistake, as the school did not really open till the 4th. Another boy had arranged to be the first pupil there, but young Kerr would not go back home for the night. He stayed alone at Glenalmond, and thus became, quite unexpectedly on his part, the first boy at the celebrated Scottish school.

Everything, or almost everything, will be forgiven to the new boy by his fellows except too much 'side' or his turning out a fraud. In the latter event his path is made so painful and so thorny that it is far better for him to leave the school in most cases rather than to have his whole life made miserable by the taunts and jeers of his comrades. At one of our biggest schools—its name must be omitted for obvious reasons—only a year or two ago a boy entered as winner of one of the chief scholarships. Indeed, he was practically at the head of the new 'scholars.' From his very entrance he talked large about what he knew and could do. But within the first week or so masters and boys alike were simply flabbergasted at his intense ignorance and strange behaviour. How he had got so high up on the list, how he had ever won a scholarship at all, was a mystery to the whole school. As the term went on he showed up worse and worse; he became a standing joke; he was the most disliked pupil in the place; he had hardly a single friend. In sheer desperation at his plight, the 'head' had to recommend his parents to withdraw him, and they did so without demur; for there is nobody in the wide world so utterly pitiable as the boy in a public school who has not a single friend or well-wisher.

The new boy is a hardy perennial. He springs up in his thousands year after year. He has three periods of blooming in the course of the twelve months, and he blossoms very effectively as a rule. His arrival is looked for with as much eagerness as that of spring or breaking-up day. He is a character that is ever the same, yet ever changing and ever changeable. There is in the new boy such potentialities, such promises of future triumphs, such hopes of coming success. Masters who have been disappointed with the barren years of the past, parents who have keenly looked forward to the day when Tommy would be in very truth a Wykehamist, sports-captains of the school who have been long waiting for a crack bowler or a dashing bat to

come on, boys who have desired to get out of the junior rank—all these hail the new boy with loud acclaim as the harbinger of good things, the hope of glories to come.

Dear old new boy! Brave, lovable, joke-causing new boy! What a grand thing it is, too, when the new boy realises those splendid and long-cherished hopes! But the world will ever regard the new boy as it is said to regard a lover; it will simply love him and laugh at him to the end.

# LAURISTONS.

By JOHN OXENHAM,

Author of *Barbe of Grand Bayou, Giant Circumstance, John of Gerisau, Great-Heart Gillian*, &c.

## CHAPTER VI.—HOW HEPSY ADMINISTERED COMFORT.

'MY goodness me! what ha'e you weans been up to noo?' asked Hepsy, as they crept softly in upon her on tiptoe.

'It's only mud—mostly, Hepsy dear,' said Mavie, looking down over her frock, on which Jerry's long-bristled brush had laid the mud in nice, regular streaks.

'Only mud—mostly! An' what's the rest?'

'Oh, a dog bit me a little, but it isn't much; and John Sax sucked it till it was all right,' reeled off Mavie quickly, by way of diversion from mud-stains and to get it all over and done with.

'A dog bit ye! Show me;' and Hepsy's gentle fingers rolled the little sleeve up hastily, and her knowing eyes settled anxiously on the discoloured wound.

'It didn't look half as bad as that till John Sax sucked it till he nearly sucked the skin off,' said Mavie by way of further extenuation.

'John Sax is a skeely wee laddie!' said Hepsy, as she tenderly examined and felt the wound. 'I think it'll be a' richt, dearie; but I doot it may leave a bit mark unless we're careful.' And she sent the boys off to rig themselves in clean things, with instructions to levy on Charlie's wardrobe if necessary, while she bathed Mavie's arm and anointed it with cooling ointment, and tied a bandage round it which would not show under her sleeve.

'We willna tell yer mither aboot it,' said Hepsy quietly, 'for she hadna too guid a nicht, an' I dinna want her troubled.'

'No, don't tell her, Hepsy dear,' agreed Mavie with relief. 'And don't tell Aunt Charlotte. She is such an old fuss.'

'We'll just keep it to oorsel's. Hoo cam' ye to be bitten by a dog?' And Mavie had to tell her all about it, and about the soldiers, and how they had broken bounds.

'Ye s'ould keep to yer bounds, dearie, or oor hearts will never be at ease anent ye. Ye mind what happened to ye before?'

'We're very strict as a rule, Hepsy; but the soldiers got into our heads, and we didn't think. Can I go in to see mother?' For at times, after a bad night, the children would be away into the fields long before Hepsy would allow her charge to be disturbed.

'Yes, dearie; go in. She was askin' for ye. But go cannily, an' make nae noise.' And Mavie skipped lightly away down the passage.

---

## CHAPTER VII.—HOW SWEET A SAINT WAS MRS CHARLES.

'MOTHER dear, I am so sorry you had such a bad night,' whispered Mavie, as she snuggled up into her privileged place inside her mother's lifted arm. 'I'll be as quiet as a mouse. I won't disturb you the least littlest bit.'

'You never disturb me, dear. Such a happy little face is the best medicine in the world. Where are the boys?'

'Oh, they're cleaning up. We got a bit dirty,' said Mavie.

'Any scalps to-day, General?' with an understanding smile, for she entered with fullest appreciation into all their doings, though bound at times to her couch for days together.

No wonder Charles Lauriston worshipped his wife. Suffering had chiselled the radiant beauty of her face to a rare and arresting loveliness which set one thinking of the sweet saints of old; though, truth to tell, the sweetest of them all was not to be compared with her. Eyes and nose and mouth and chin all combined to a fine totality of quiet strength and endurance, gracious and beautiful still in spite of—rather because of—their long and severe chastening. It was a brave, sweet soul that looked out through the calm eyes and gentle face, and seemed even to illuminate from within the rare soft texture of its envelopment. She was a perfect expression of strength in weakness; for, if at times her bodily vigour was small, none had ever heard a word of complaint from her lips. On the contrary, she was ever ready with cheer and heartening for those whose lot was far more smoothly cast, and yet had fault to find with it, and her smile was an unspoken blessing. She was a wonder to many, but not to those who knew her best and knew from what deep wells her strength was drawn.

'We didn't get as far as scalps,' said Mavie. 'Some soldiers came past, and we ran after them, only just a wee, wee little bit, mother'—this very

quickly, to shave off the awkward corner of trespass —'and, what do you think? It was father's old regiment, Jerry says. And an officer on a great big gray horse took Charlie up in front of him, and one offered to take me up too, but I didn't like, though I wanted to ever so much; and Charlie looked splendid, and the officer's going to look out for him when he goes into the army.'

'Well, well! I'm glad the great big gray horses did not tread on any of you.'

'Oh, they were lovely, and the great big men too; and the officer who took Charlie up was a dear. I do wish I could be a soldier!' At which her mother laughed softly.

'You'll have other work to do in the world, dear. Soldiering is not the only thing in life, nor the noblest. It is better to make than to mar.'

'But it's so little a girl can do. All the great big, grand things are for the men'——

'But for us women, Mavie, the grandest things of all—to keep life sweet and beautiful. It is better to build than to break down, better to heal than to wound.'

'Ye—es,' admitted Mavie grudgingly. 'But men must fight sometimes.'

'Sometimes they must, when nothing else will avail. But you will see things differently as you grow older, and then you will find out that a woman has her work in the world, and that it is no whit behind a man's. How are the little Frenchman and John Sax getting on?'

'Oh, all right. Etienne's rather a cheat, you know, and John Sax is rather stupid.' At which her mother smiled.

'I have a very high opinion of John Sax,' she said quietly. 'He is not a fireworks like the rest of you, but he's a boy to trust.'

'Oh, he's as straight as an arrow, is John; but he really hasn't much 'magination, you know.'

'Some people I know have more than their share.'

'I like 'magination; it makes you feel large and wide.'

'It's a good thing, if it doesn't carry you out of bounds.'

'We only went just a wee, wee little way, mother.'

'Yes, dear; I wasn't thinking of that. John Sax will never go much out of bounds, I'll wager.'

'But he did,' cried Mavie gleefully. 'He just went with the rest of us.'

'Then I'll be bound he came last to look after you all.'

''M—yes, he was last. He generally is. But he went all the same.'

'John takes after his grandfather. I don't know what yours would do without him. He is his right hand at the bank, and one of the very best men I know. Now, will you run and bring the boys to me for a minute before you go in to dinner?'

### CHAPTER VIII.—HOW AUNT CHARLOTTE FEARED HIGHWAYMEN.

AUNT CHARLOTTE presided at the children's dinner. They had to wait for her. People generally had to wait for Aunt Charlotte. It was one of the many outward signs of her lack of inward and spiritual grace—a passive want of consideration for others which we have learned to estimate as little less mischievous in its effects than active malevolence.

Of a surety Aunt Charlotte wished no ill to any living creature; unless, maybe, to footpads and highwaymen in general, of whom she had a morbid horror ever since one of the fraternity stopped her coach on Ealing Common one night, and courteously relieved her of her rings and diamond necklace, just as she was congratulating herself on her safety. And no one would have been more surprised than herself had she been told in confidence that she was a perpetual and unmitigated nuisance in a regulated household.

She came sailing in at last, tall, fair, smiling at nothing in particular, a fine figure of a woman, and distinctly good-looking, if somewhat lymphatic.

'Dear, dear! and have I kept you all waiting?' she beamed.

'Yes, ma'am,' said Charles, somewhat saucily. 'But we do not mind. We are used to it.'

'Ah, in my young days gentlemen never minded waiting for a lady,' said Aunt Charlotte, settling gracefully into her chair with a beaming smile all round.

'I suppose they would get used to it too in time.'

'How true it is! One can get used to anything. But, above all things, one should cultivate politeness to ladies.—'*N'est ce pas, mon cher?*' to Etienne. She spoke French well, and was proud of it.

'*Mais assurément, mademoiselle,*' bowed Etienne, with the grace of a De Montessonne.

'What gentlemen they breed in France!' mused Aunt Charlotte, beaming approvingly on him.

'Robespierre!' murmured the incorrigible Charles under his breath. For though, from their association with M. de Montessonne and Etienne, they all spoke French fairly well, they still regarded it as a task-language, and resented its unnecessary introduction into familiar intercourse.

'Ah, we must not judge,' said Aunt Charlotte, as the rasp of the hated name caught her ear. 'Above all things, let us be charitable, my dears;' and added vaguely, 'for what else is there, you know?' which was Aunt Charlotte all over.

'Oh, well, there's dinner, and I'm hungry,' said Charles stoutly.

'*Mais c'est bien evident;*' and turning to Etienne, she continued, 'I shall see M. le Marquis to-night, I expect. Shall I give him any message from you? And what report shall I give him?'

'My compliments to monsieur, mademoiselle,

and we are behaving beautifully, and enjoying it much.'

'*C'est bien!* And you are not letting these wild Red Indian people lead you into any mischief? I hear you all came home covered with mud. What had you been doing to get so dirty?'

'We were just playing,' said Etienne non-committally; and even Charles, who had already explained the matter to his mother, felt no necessity to enlighten Aunt Charlotte.

'Well,' said she, looking pointedly at Charles and Mavie, 'I do hope you will remember your papa's instructions. I never shall forget the state we were all in the last time you two went astray. All night we were thinking all manner of awful things. And your poor mamma!' Aunt Charlotte could not express what poor mamma had felt.

'Oh, well, that's all past, Aunt Charlotte, and we were as sorry as we could be,' said Charles with a very warm face. 'There's no need to keep on raking it up again.'

'I don't want to rake it up, my dear boy; but I do hope you'll never do it again.'

'Jerry 's getting his pistols ready, Aunt Charlotte,' said Charles presently with an air of sympathetic reassurance, by way of counter-stroke.

'His pistols, Charles! Whatever for?' with a startled look which afforded Charles the greatest possible gratification.

'Didn't you hear, aunt? The Windsor coach was stopped last night, and the passengers robbed of every penny. I thought Honeybun would have told you'—not ill-pleased at the chance of plumping a shot into that tale-bearing handmaiden.

'No, she didn't tell me,' said Aunt Charlotte breathlessly. 'Whatever shall I do? Go I must. Mr Fox is to be there, and Mr Pitt is expected to look in during the evening, and your grandfather is counting upon me to do the honours.'

'Oh, well, Jerry will have his pistols,' repeated Charles encouragingly.

'Dreadful! To think that we cannot go a trifling journey such as that without exposing ourselves to such horrid risks. I shall speak to Mr Pitt about it.'

'I expect he knows,' said Charles. 'It would take a lot of Mr Pitts to catch all the highwaymen. Jerry's pistols will be of more use. You should have one inside with you, Aunt Charlotte, and when the highwayman comes to the door shoot him down, as Lord Strathmore did, and the other one will run away'——

'Dreadful! Dreadful! I know nothing of pistols. There is nothing for it but to trust in Providence, I suppose; for really what else is there, you know?' And she gazed at them helplessly, in great distress of mind, and evidently already saw old Jerry lying weltering in his gore, and herself and Honeybun at the tender mercy of the gentlemen of the crape masks and sprightly heels.

'I'll go with you if you like, Aunt Charlotte,' suggested Charles hopefully. 'I wouldn't half mind potting a highwayman. It would be rare fun.'

'Your mamma wouldn't hear of it, and I'm told it is best not to resist them, or even to look at them too close. If you do, they make an end of you. How unspeakable life is!' she sighed. 'I'm truly sorry I ever came to the country.'

And more than one of them could have enlarged upon that head; but they only looked what they thought, and Aunt Charlotte went off for a personal consultation with Jerry.

(*To be continued.*)

## THE POSTAGE-STAMP AND ITS STORY.

'WHO invented the postage-stamp?' is a question often asked, and to find its answer we must go back to the seventeenth century. In 1653 the Comte de Nogent and the Sieur de Villayer obtained from Louis XIV. the privilege of establishing post-boxes in various quarters of Paris. A printed 'instruction' was issued to the public, stating that their correspondence would be transmitted if they 'put with their letters a piece of paper which is to bear the words *port payé*, because no money will be accepted; the said piece of paper is to be attached to the said letter, or put round the letter, or slipped inside the letter, or in any way they may find convenient; in such wise, however, that the clerk may see it and remove it easily.' If a specimen of this *billet de port-payé* or postage-paid note were unearthed at the present day it would be worth many times its weight in gold, but no copies are known to exist; and this is not to be wondered at, since each *billet* was removed in transmission and presumably destroyed. We do not even know what it was like in shape, and can only guess that it may have been a narrow strip or band of paper somewhat like the stamped newspaper-wrappers in use in our own time. It bore a certain inscription and a private mark of De Villayer's, and there is little doubt that to De Villayer himself the credit of its invention is due, De Nogent's connection with the post being merely a nominal one. Indeed, we learn from Saint-Simon that De Villayer was 'a fellow full of singular inventions, and had plenty of cleverness,' and was also the inventor of 'those flying chairs that move by means of counter-weights up and down between two walls to the floor required'—in other words, of what we now call lifts.

But nowadays postage-stamps mean to most people the little gummed labels affixed to our letters; and so, if the question with which this

article begins is asked, the inquirer most likely intends to say, 'Who invented the adhesive postage-stamp?' In February 1837 Rowland Hill proposed the use of 'a bit of paper just large enough to bear the stamp, and covered at the back with a glutinous wash, which the bringer might, by the application of a little moisture, attach to the back of the letter.' No evidence that will bear the slightest scrutiny has been produced to support the various prior claims to the invention of the adhesive postage-stamp; and even should such a claim ever be established, it could not in the slightest degree lessen Rowland Hill's reputation, for it was only the adoption of his great plan of a uniform rate of postage, coupled with prepayment, that rendered the general use of stamps, impressed or adhesive, practicable for postal purposes.

In January 1840 uniform penny-postage came into being; but it was not until May of that year that the postage-stamps themselves were ready. There were four varieties in all: adhesive stamps of the value of one penny black and twopence blue, and envelopes of the same values. The stamps showed a profile of the youthful Queen, after a medal by Wyon, and in their severe elegance of design and superb engraver's-work form miniature works of art that in their kind have never since been surpassed or even equalled. The envelopes (known familiarly to collectors as the 'Mulreadies') bore an elaborate allegorical design by William Mulready, R.A., in which Britannia was seen despatching winged messengers to all the quarters of the globe; or, to quote the author of the *Ingoldsby Legends*:

> Those queer-looking envelope things,
> Where Britannia (who seems to be crucified) flings
> To her right and her left funny people with wings,
> Among elephants, Quakers, and Catabaw kings.

As enormous values are sometimes attributed to these early stamps, it may be well to say that specimens of the penny stamp are still readily obtainable from the dealers at sixpence apiece, and of the penny envelopes at as many shillings. The original penny stamp (or 'queen's head,' as it was called for many years), though its colour was altered from black to red in 1841, remained in use until 1880, by which time the number of stamps of this denomination had reached the enormous total of twenty thousand six hundred and ninety-nine millions eight hundred and fifty thousand and forty. On the other hand, the 'Mulready' envelopes were in use for a few months only; the public, contrary to expectation, showed a very marked preference for the convenient little 'queen's heads,' and Mulready's design, while not devoid of merit, lent itself easily to unmerciful caricature, literary and pictorial. Rowland Hill himself wrote reluctantly in his diary: 'I fear we shall be obliged to substitute some other stamp for that designed by Mulready, which is abused and ridiculed on all sides. In departing so widely from the established "lion and unicorn" nonsense I fear that we have run counter to settled opinions and prejudices somewhat rashly. I now think it would have been wiser to have followed established custom in all the details of the measure where practicable.'

At the end of ten years after the introduction of Rowland Hill's stamp only thirteen foreign countries had adopted the invention, and it is curious to think that the example of Great Britain should first have been followed, in 1843, not by other great European powers, but by Brazil and two Swiss cantons. But during the fifties the accessions came thick and fast, till by January 1860 there were eighty-five countries that had issued postage-stamps. These coloured labels, with their interesting and sometimes mystifying varieties of design and lettering, soon began to attract the notice of the curious, and early in the fifties a few individuals here and there were forming stamp collections in ignorance of each other's existence. Still, it was not until 1861 that the hobby attracted public attention, developing in the following year into a veritable craze. An open-air stamp-bourse established itself in the narrow passage of Birchin Lane, Cornhill, where high and low, rich and poor, congregated for sale and exchange. 'We were often raided by the police,' writes a veteran philatelist. 'I myself was taken to the police-office on the charge of collecting a crowd and obstructing traffic. The scene was interesting and amusing—an assemblage of ladies and gentlemen, youths and small boys, each with a book or books full of stamps, as intent on business as the regular stock-jobbers of the neighbourhood. One of Her Majesty's Cabinet Ministers was seen there, and ladies with their albums carried by livery-servants.'

Professional stamp-dealers sprang up, printed catalogues were published by Dr Gray of the British Museum and others, and periodical journals treating of stamps began to appear. The stamp-mania, like all manias, died; the Birchin Lane gatherings dwindled away, and stamp-collecting, soon to be dignified by the name of philately, settled down into an organised pursuit, worthy of a place as the younger sister of numismatics. In 1869 the Philatelic Society was founded in London under the presidency of the late Sir Daniel Cooper, Bart., succeeded in turn by Mr (now Judge) Philbrick, K.C., the late Earl of Kingston, and in 1896 by the Duke of York, who as Prince of Wales still holds that office. In 1906 His Majesty the King signified his pleasure that the society should be styled 'The Royal Philatelic Society, London,' which title it now bears.

Perhaps the most important event in the annals of philately was the munificent bequest in 1891 of the late Mr Tapling's collection to the British Museum, for its acceptance by the trustees of the national treasure-house effectually brought to an end the old days when stamp-collecting could be dismissed with a contemptuous smile as a pastime for children, or at best a method of instilling some notions of geography into the juvenile mind. The vast collection in question—the second greatest in

the world—was brought together by Thomas Keay Tapling, M.P., who died at the early age of thirty-six years. He collected as a schoolboy, and when he was about fifteen an old gentleman, a friend of his family, gave him a Christmas present of one hundred pounds on condition that he was not to bank it but to spend it as he liked. He devoted the whole of the money to stamps. Through every period of his life—at Harrow and Cambridge, as a student of medicine, and at the Inner Temple, and finally as head of the great City mercantile firm of Thomas Tapling & Co., of Gresham Street—he steadily continued his collection, studying both the stamps themselves and the literature which treats of them. After his death the work of re-arranging and mounting the collection for the British Museum was entrusted to an expert, who was occupied for seven years in the task. For some years only a few sheets of the collection were on view in glass cases in the King's Library, the contents being changed from time to time; but this unsatisfactory plan was superseded a few years ago by the use of three great cabinets with vertical slides, which were constructed at a cost of three thousand six hundred pounds. These cabinets contain the whole of the adhesive stamps in the collection, with the exception of nine specimens of the greatest rarity, which are shown in a room apart.

Among these rarities are the famous 'Post-Office' stamps of Mauritius (1847), specimens of which have always been keenly sought after by philatelists on account of their exceeding rarity. The stamps derive their name from the inscription on the left of the design, which shows a primitively drawn profile of Queen Victoria crowned with a diadem. There are two values, a penny one printed in orange-red and a twopenny in dark-blue. The stamps were engraved by a watchmaker of Port Louis, and only one thousand were printed, of which number only twenty-six copies are known to exist at the present day. The first specimens did not come to light till 1865, when two used stamps, one of each denomination, from the album of a Bordeaux collector, were bought for eight pounds by a Brussels dealer, and sold to Mr Philbrick for twenty pounds, then an enormous price to pay for a couple of postage-stamps. They now have their resting-place in the largest collection in the world, the property of M. la Renotière of Paris, who bought the Philbrick collection in 1881 for eight thousand pounds. By 1875 the price of 'Post-Office Mauritius' stamps had risen a little; in that year a copy of the twopenny stamp was found in the collection of another Bordeaux amateur, who was anxious to raise the necessary funds for a visit of pleasure to the gay capital. It was sold for twelve pounds, and passed into the hands of M. la Renotière, who in his turn exchanged it with Mr Tapling for some other stamps. It was not until 1878 that another 'Post-Office' stamp, a penny one (used), turned up. Major E. B. Evans, R.A., was then stationed at Port Louis, and he bought from a professor of music a small collection in which was the stamp in question. He estimated its value at about thirty pounds, and after keeping it for some years he sold it to Mr Tapling for seventy-five pounds. This specimen is now, with the companion twopenny stamp already mentioned, in the British Museum; it is preserved on the original envelope, which was addressed to a 'Monsieur Alcide Marquay,' and contained an invitation to a ball given by Lady Gomm, the wife of the Governor of the island.

The latest specimen of the 'Post-Office Mauritius' to be discovered was in a little collection made by the vendor, a Hampstead resident, when a schoolboy in 1864. The collection itself contained nothing but trivial rubbish with the exception of this 'Post-Office' stamp, a twopenny blue, unused and in faultless preservation, with the small original margins intact. It was put up at auction in January 1904, amid a large assemblage of stamp-dealers and collectors. The bidding started at five hundred pounds, and went by hundreds to seven hundred pounds, this latter price being offered by a collector who already possessed two copies of the penny red stamp. It was then jumped to one thousand pounds by a London dealer, who went as high as one thousand two hundred pounds. Two other dealers then bid up to one thousand four hundred pounds, at which point one dropped out, and it was knocked down to the other, acting for the Prince of Wales, for one thousand four hundred and fifty pounds, the highest price on record for a postage-stamp.

Another of the British Museum rarities is the British Guiana two cents rose, of 1851, a primitive-looking stamp set up in that year from ordinary printers' type at the *Royal Gazette* office in Georgetown. This stamp is even rarer than the 'Post-Office Mauritius,' and remained unknown till 1877–1878, when four copies were discovered. One was sold to M. la Renotière; one, after passing through many hands, went into the collection of the late Sir W. B. Avery, Bart.; another was sold for twenty pounds to Mr Philbrick, and sixteen years later fetched two hundred and ten pounds at the Hunter sale in New York; the remaining one was sold to the late Mr W. E. Image, and is the specimen now in the Tapling collection. No more copies came to light until 1889, when a pair was found and sold for one hundred and seventy-five pounds. In 1896 another pair was discovered, and has an interesting history, which Canon F. P. Luigi Josa, of Christ Church, Demerara, tells as follows: 'One Easter Day, 1896, Christ Church was financially in a bad way. We were overdrawn at our banker's to the tune of one hundred pounds odd. We had an instalment of the mortgage on our chief school due, and other claims, and we were making efforts to raise some money, and our comparatively poor people gave an Easter offering of a little over seventy-five pounds. An old coloured lady, Miss Preston by name, sent me two blue stamps of 1852, and these I sold for thirty-three dollars sixty cents,

and on Easter Monday I wended my way to Miss Preston to thank her for the gift. Whilst there I inquired whether she had any more of these valuable stamps, especially as buyers were in search of the circular stamps of 1851, and for the two cents rose they were offering over one hundred pounds. Miss Preston said she had given all her stamps away, but she brought out an old basket filled with old receipts and bills. I searched, when, lo and behold! there tumbled out of the basket an envelope addressed "Miss Rose, Blankenburg," this being the name of one of our plantations on the west coast of Demerara. This envelope contained two stamps, an unsevered pair, and they were the very stamps that buyers had been in search of, and for which there were standing advertisements. The lady, Miss Rose, to whom it was addressed, was present in the room, being also a member of my church. On hearing that the two stamps were worth a lot of money, she literally danced with joy, and said, "Thank God! I am at last able to give something worth while." Both the old ladies, although they owned their house and land, were comparatively poor, and so I took my churchwarden to thank them again, and to persuade them to receive a portion of whatever they might fetch. "Not a penny, sir; not a penny. These stamps were reserved for my dear old church."' The stamps were sold by Canon Josa for two hundred and nine pounds, and passed through various hands at increasing prices, being finally sold to Mr H. J. Duveen for six hundred pounds.

A greater stamp 'find' occurred in 1895, when a Kentucky coon, Black Bob, employed as porter at the Louisville (Kentucky) court-house, was commissioned to clear up some boxes of old correspondence. In the act of shovelling a large batch of old letters into the furnace, several that were loose fell at the negro's feet. To one of them Bob noticed a stamp attached. He picked it up for examination, and a search through other bundles brought more stamps to his view, till altogether he found one hundred and forty-seven of the rare St Louis postmaster's stamps of 1845. The stamps were on the mail of a St Louis banking-house addressed to their Louisville correspondent. The janitors of the building discovered the darky curiously examining his find, and one of them, knowing of an adult friend who 'liked such things,' as he said, offered a 'quarter' and a drink for the lot, and Bob was too thirsty to resist. The janitors in their turn sold the first lot of nine stamps for five dollars; but on discovering their true value they obtained a more satisfactory price for the rest, and indeed got fifteen hundred dollars for their last eighteen. The whole lot was resold for nearly twenty-three thousand dollars, it is said, the reputed retail value being sixty thousand dollars.

The knowledge of *trouvailles* like these serves to inspire every collector with the hope that he too may meet one day with some such good fortune; but the tale of high prices realised for rarities must not be read as meaning that stamp-collecting is necessarily associated with a colossal outlay. At the present day a collection numbering many hundreds may be obtained for a few pounds or even shillings; many substantial collections, indeed, have been formed simply by gifts and the wise exchange of duplicates. This being said, we may fitly conclude with the following testimony written by a venerable French *savant:* 'What was originally in my case nothing more than a mere amusement or relaxation became in time the subject of extended researches, studies, and works of all kinds, foreign, I confess, to my profession, but supplying my mind with never-failing enjoyment, and so offering a delightful diversion to the cares and preoccupations of daily life.'

# THE FORGOTTEN ROCK.*

By JOHN FOSTER, Author of *The Luck o' the Spey*, &c.

CHAPTER IV.—*continued.*

THEY laid him down on an improvised couch aft, and a silence fell on the ship. Flett had done the best in bandaging and restoratives that his rough-and-ready knowledge allowed; and as he watched the still figure with an aching heart, grimly recalling the events of the last few hours, Westwater's ravings, the scene down the cleft in the isle, suspicions, hopes, fears, a hundred formless conjectures obtruded themselves. Who was Dick, who had left his bones on the Forgotten Rock? And the rubies —whose were they? Who was Westwater? The belt round the captain's waist seemed to him to be a positive weight.

He watched patiently, the white night wearing slowly into morning. Suddenly there was a movement from the couch. Westwater slowly opened his eyes and looked at Flett and his surroundings. This time there was speculation in his gaze. He smiled feebly, saying nothing, a pitiable anxiety growing in his eyes. The skipper gave him some brandy, and a patch of colour rose in his face as he beckoned Hugh nearer him with an anxious gesture. The skipper bent over him.

'I remember! Send—the—others—away!' he gasped.

Flett signalled the mate to withdraw, and they

* *All rights reserved.*

were alone, but for a shadow, The Shadow, near the stricken man. Westwater's hands wandered slowly down, and clutched suddenly at his waist.

'Where is it—the belt, skipper?' he whispered, almost fiercely.

'Safe with me,' said Flett, and showed him it around his own waist. 'Safe! You 'll have it back when you 're better.'

The ghost of his old smile flickered on the other's face.

'When I'm better! I've had a runaway knock or two at the Door in my time; but—this time I'm—going—inside. You know what the belt holds?'

Flett nodded. 'Ay; I know.'

'Curse them! Throw them into the Gulf! Curse them!' he said, an uncanny vigour in his voice.

'S-steady, man! Curse naething just at—at—this time. If they're no' yours, you've time yet to'——

'No, no. "*Rien n'va plus*," I hear the croupier. I've played, and lost the game. That 's all.' His voice went down again to a weak whisper.

'No, no,' Flett broke in quickly, 'it 's no' the end o' a game ye're at. You've time yet'—he hesitated—'if you want to—to—to repent.'

The other man looked intently, penetratingly into the captain's eyes, and hung his head, blank despair in his wide, staring eyes as he held out a hand to the other. The big captain took it in his, and was on his knees on the instant beside him, telling him—not without the difficult and searing tears of manhood—broken, humble words of counsel: of hope, mercy; of the tremendous words 'the forgiveness of sins, the life everlasting,' his slow, clumsy pleading strewn from the bedrock of his heart with his native Scots speech, homely, incongruous, rugged, but heard and understood by shining companies of angels.

'Leave me—for a moment, captain,' said Westwater; and Flett, slow in many things, was swift to understand. He went softly from his side, as he saw the other's white lips moving.

Westwater raised himself slowly, leaning on one elbow. 'I'm ready. Promise me—something. Promise.'

'I do,' said Flett simply, and held out his hand again. The other took it. 'But what aboot the—on the Rock yonder—an' the—who was'——

'Dick! Who was Dick, you mean?' He gulped down more brandy. 'Dick was—Dick. My ape for the—the chestnuts. I'm to blame. Let it go at that. Poor Dick! He and I shipped as stokers on the *Dark Rosaleen*, out of Hull, on her last voyage.'

'You a stoker! The *Dark Rosaleen!*' interjected Flett. 'Lost with all hands, oot there, in a fog.'

'So Lloyd's report. Wrong. A collision. Dick and I were the only men saved. The worse for us both. We got ashore on the Forgotten Rock. Winter coming on—no food—bitter cold. So we waited—together—for Death, starving, with a fortune beside us. A fortune. There it is!' He pointed to the belt. 'One day—making for the crest to signal, a blizzard caught us. Dick fell over the cleft, carrying the belt with him. I wandered about—two days. Russian gunboat, on survey, took me off—brain-fever. Then England. Then I shipped with you, Flett, to come back—for them. I 'm sorry, Flett. I knew the spot, I thought, and here—I—am.' He dropped back exhausted.

'An' the jewels—what 's to be done wi' them?'

'Flett, promise me again!'

'I have promised.'

'I ask your pardon, captain. Listen. Take them—to the man—I name—in London. They are his. And give him this too.' He groped in a pocket, and then handed Flett a little book. 'He is a just man, and I—I—good God! I was his friend once. Write the name down—now, now, quickly!'

Flett took out a pencil and a scrap of paper.

'Lord Criffel—9—Cromdale Square, London. He 'll know the sender, and no one else—in this world.'

The captain started. The Criffel rubies! Surely he had heard the phrase before, or read something like it, somewhere? He wrote the name and address down, and the other gave a sigh of relief as he watched him. Flett was following up the train of thought, when he heard, this time in a weak and halting whisper:

'Captain, another promise. Don't take me to England. Bury me at sea.'

'But your friends, an'—an' home,' said Hugh gently, for he saw that The Shadow had drawn closer.

The other shook his head.

'No! I've been—a—a—coward. No lofty walls of Troy for me. Promise me!' he asked, almost a command in his eyes.

'I promise,' said the captain, taking his hand. The other gave a quick glance of thanks and lay silent.

The sun was up, the wide arch of the heavens filled with it and the freshness of the morning, the floor of the sea dazzling white in the distance, nearer, changing into blue, and close at hand into clear green broken by the dark-brown tangles of seaweed in the shallows around the ship.

Dying embers of the Kokko fires wrought fitful stains on the clean air. Faint, far-off laughter of some belated revellers tinkled over the burnished bay. Birds called and called in the woods, and a couple of butterflies chased each other in a white and trembling zigzag round and round the deck, over the side, and out of sight. In the article of death, the man's gaze followed their snowy flicker, until The Shadow laid its slow, sure hand over his eyes.

In the distance the thin, formal chimes of the Swedish brigantine's bell heralded the routine of a new day.

*(To be continued.)*

# PORTLAND (MAINE), LONGFELLOW'S 'BEAUTIFUL TOWN.'

By F. C. Armstrong.

WELL might her most illustrious son sing the praises of his birthplace in verses that will live as long as the language in which they are written; for, seated amongst her hills, in her mantle of living green, and with her exquisite bay sparkling at her feet, the city of Portland is one of the fairest, as well as the most interesting, of New England towns. For America, she is a venerable town. It is nearly three hundred years since Captain John Smith—better known by his exploits in Virginia than his explorations along a coast which the early visitors thought too cold and bleak to be inhabited—found that 'west of the Kennebec River is the land of Ancocisco, at the bottom of a deep bay filled with many great islands, which divide it into many good harbours.' Recognising a fine harbour of refuge on an unfriendly coast, the brave pioneer left a few men upon the 'neck' or promontory of the mainland which jutted out into the bay, and sailed away to make further discoveries elsewhere.

If the brave sailor saw the bay as it revealed itself to more modern eyes almost three centuries afterwards it is small wonder that he was struck with its beauty, for the world has few more lovely prospects than that which lies at the feet of the fair town. Lightly resting, like great emeralds fringed with pearl upon a sea of sparkling sapphire, lie upon the waters of the bay the islands which were the 'Hesperides' of her young poet's dreams. Far away beyond them gleams the wonder and mystery of the great ocean, stretching into infinity; and when you look towards the land you see undulating hills clothed in the richest tints of varying green. The town behind you is well named 'Forest City,' for her busiest streets are fringed with tall elm-trees that cast a pleasant shade upon the crowded side-walks below, while in her demure residential avenues the splendid trees lining them give a sense of restful privacy which is very pleasant and refreshing.

When John Smith first saw the beautiful prospect mainland and islands were clothed in impenetrable forests, and amongst those dark shadows lurked a foe so cruel and relentless that the bravest hearts sank at the very mention of the Red Men. One of the larger islands, now a crowded summer resort, was a favourite gathering-place of these demoniac enemies. During the terrible Indian wars in the later decades of the seventeenth century many fierce attacks were made upon the town from this vantage-point.

At first the young colony was not greatly troubled by the savages; they did not, perhaps, think the place of sufficient importance to be pillaged. It was not until 1623, nine years after John Smith had visited the 'neck,' that anything like a colony began to take form. Then an adventurer named Christopher Levett landed on the promontory and actually began to build 'stone houses.' Levett returned to London, and his comrades seem to have melted away.

Ten years later two men who appear to have had interest in high places procured from old Sir Ferdinando Gorges, about the last survivor of the earliest commission, a grant of the whole district. These men, who were named Cleve and Tucker, managed to secure this lease on very favourable terms. It is quite possible that Sir Ferdinando had no very definite idea of the vastness of the territory he was signing away for a term of two thousand years. It seems as if the very vaguest ideas of the enormous size of the new continent existed on the other side. Even within our own time ignorance of geographical distances has led to mistakes sometimes.

With that wistful yearning after home which has scattered broadcast over the face of New England the familiar names of the Old Country, the settlers on Casco Bay called the little town Falmouth, and the name still exists in the lower parts of the city, along what was then the sea-front, but which now is lined with the black wharves and the quays of her poetic son's verses.

Cleve visited London more than once in order to make sure of his rights, which he so strongly established that to this day all the lands in the large district are held under the act of settlement he then procured. But he himself did not enjoy the advantages he secured for the town. He died poor, worn out, it is said, by endless litigation.

The outbreak of what is known as the Indian war in 1670 tried the growing town sorely. The Red Indians, backed by the French, fell upon it, determined to exterminate the inhabitants and burn the houses. But, although the savages were amply supplied with arms and ammunition by their civilised allies, the resolute stand made by a mere handful of brave men within the little town held them at bay until help arrived.

Amongst that heroic band of defenders there was a man who was doomed to perish by the hands of his own countrymen. This was George Burroughs, the 'Fighting Minister,' who for some time had been 'an acceptable preacher' in Falmouth. His evil fate led him back to Salem after the splendid defence of Falmouth, and there he perished miserably when the mad delusion of witchcraft fell upon that 'saintly' town. In her sad tale of *Lois the Witch*, Mrs Oliphant has lightly outlined his splendid personality; but the historical records of his character are more striking than the fictitious.

It was during these years of strain and stress that a number of Huguenot families, driven from their homes by the Revocation of the Edict of Nantes, arrived at Falmouth to make their mark upon the civilisation of the new town. England and France were now at war, and the soldiers of the 'Most Christian King' fought side by side with the savage Red Men against the growing town. In one of their ruthless attacks it was burned to the ground, this being the first of the three conflagrations that have passed over the fair city. She speedily recovered from this catastrophe. A truce was concluded with the Indians; but when the town was rebuilt, very wisely a fine fort was also built for her protection. New immigrants from the Old Country reinforced the population, bringing fresh enterprise along with them. They saw the splendid possibilities of the town, and began to develop them. At her feet lay a magnificent waterway; behind her, woods that provided an inexhaustible supply of the finest timber in the world. Soon a shipbuilding industry sprang up, bringing in its train other auxiliary trades. Her ropewalks have been made classical by her sweet singer, who has also ennobled her potteries by his genius; but a great provision trade, fisheries, and, above all, her overseas commerce with the West Indian Islands brought to her busy quays a flowing tide of wealth. Strange that a city almost fanatically prohibitionist should owe so much of her wealth to the manufacture of strong drink, but such is the unquestionable fact. It was through the tons of molasses carried to her port from the great sugar-producing islands of the west that the famous New England rum of our ancestors was produced, and the distilleries of Portland were the chief source of her prosperity for many long years.

Revolutionary troubles sorely interfered with her prosperity for a time. Curiously enough, she had amongst her burgesses men who stood for the king, and suffered for their loyalty. But, indeed, the good town had her justifiable reasons for turning her back upon King George. A certain Commodore Mowat, of the Royal Navy, upon what appears to have been very slight provocation, shelled the town, burning it to the ground, at a loss, it is said, of fifty thousand pounds to the citizens. This was in 1775.

But once the troubles were overpast, Portland, now a chartered city, with Falmouth for a suburb, forged ahead. New houses were erected, new markets were opened, with fresh enterprise to bring still greater wealth into her hands, and the world went very well with the newly built city.

In 1785 General Peleg Wadsworth, a distinguished citizen, who had covered himself with glory during the war, began to build for himself upon the extreme outskirts of the city the comfortable red-brick house that is now set apart as a memorial of his famous grandson and namesake, Henry Wadsworth Longfellow. At that time the substantial mansion stood apart amongst its sheltering trees in a wide garden. To-day it is in the heart of the city. The old trees still stand in the small court-yard in front; but the wide garden is covered with houses, and the quiet country road upon which it stood is a street filled with busy traffic. There is something very quaint and suggestive about the house. The bricks of which it is composed have acquired a wonderful richness of colour in the passing of the years. It is exactly as it was when the poet lived under its roof-tree, and the pride of the city is to keep intact everything connected with him it has gathered into the old rooms. He was not born here; but he was only eight months old when, twenty years after the house was built, General Wadsworth moved to an estate conferred upon him by a grateful country for his services during the war, and Stephen Longfellow, who had married his fair and wise daughter Zilpa, moved into the town-house, bringing with them the infant who was to be the most illustrious of that town's sons.

Stephen Longfellow, the poet's father, handsome, brilliant, and a rising lawyer, came of a good old English stock improved by generations of strenuous colonial life. He did well for himself when he took to wife the mother of his poet-son. You can see their portraits on the walls of the house in which they lived and died. Personal beauty was one of Nature's gifts to the family. Even the stiff, old-fashioned local painters who left their presentments to us have not failed to give us the impression of a gifted family. General Wadsworth looks like a handsome, debonair old gentleman of a courtly school, and his son-in-law must have been a more than commonly 'personable' man. The ladies' likenesses are not so successful; still, you can understand a good deal that the painters have left to the imagination.

In 1825, when the poet was still a dreamy boy, Mr Longfellow found the house too small for his large family — there were eight children and a maiden aunt residing in the house, with its original four rooms on each floor — so a third story was added. In this addition to the home you can see the room in which the poet slept. The house is almost austere in its simplicity; the furniture solid, simple, good of its kind, but absolutely devoid of ornament. Most interesting is the old, ink-stained desk in the little back parlour where the poet wrote several of his well-known verses, including 'The Rainy Day.' You cannot help feeling a thrill as you touch the severely plain bit of old furniture, and think of the visionary lad who wandered about the 'beautiful town' when its reviving trade was at its busiest. Because the embargo of 1807–12 had played havoc with the trade of the town, her ships lay idle at her wharves or rotted in the bay; her seamen sought other ports or else took to evil ways; her industries languished; her population decreased; her gallant captains were flung idle upon the world, which seemed to have no room for them. But when the war of 1812 broke out the city seemed to leap back to life. Her ships awoke from their long

sleep, and sailed familiar waters once more in all their olden pride; the city revived, renewing her youth; and in its midst walked a little child whose young eyes were seeing and whose ears were listening to all that went on round him, to be stored in memory and transmuted into golden verse when the time for singing arrived. He was only an infant of five when the thunder of battle resounded over the town, and a fierce fight raged at her very gates. In the bay at her feet was fought all through a summer morning the sea-fight of Casco Bay, when the English brig *Boxer* met the United States frigate *Enterprise* in deadly combat. How the thunder of those guns must have impressed itself upon the child's brain, when in after-life—indeed, in the end of his splendid career—he tells us how he

> Remembered the sea-fight far away,
> How it thundered o'er the tide;
> And the dead captains as they lay
> In their graves o'erlooking the tranquil bay,
> Where they in battle died.

For the result of the fight was the death of the two commanders, and a noble funeral, and an honoured resting-place in the fine old Eastern Cemetery that overlooks one of the loveliest scenes on earth.

How much the 'magic of the sea' and the 'beauty and mystery' of the ships impressed the boy's vivid imagination we who read his poems can well understand. Only a boy who had hung round the shipbuilders' yard, and noted every stage of the ship's progress from keel to crow's-nest, could as a man produce poems like his 'Building of the Ship.' Or how could any one who had not grown up in the vicinity of a ropewalk write the lovely verses he dedicated to what, after all, is a prosaic business? The sea seems to throb in his very blood and brain, and it is in his poems dealing with ocean that he is at his best, and that 'best' is very good indeed.

He knew the woods right well also. The lovely stretches of planting that lie close to the busiest parts of his beloved 'beautiful town' were haunted places to him. With tender, longing remembrance he returns to his native city to renew old impressions when his fame had spread wherever the English language was spoken; for, like many another poet-dreamer, he had lived long enough to find that 'old things were best,' and in spirit he wanders through 'Deering Woods' to find amongst their 'leafy domes' his lost youth, with all its gleams and glooms, its songs and silences, which he has translated for us into a language that stirs our inmost soul.

He wandered far from the old red-brick house; yet, as we stand under its roof, he does not seem far away. There is the cradle in which he slept the deep slumbers of infancy, the little cap that covered his baby-head, the frocks he wore while he was yet 'the baby' of the family. Later, we can read the letters he wrote home while he was wandering in the lands beyond the Hesperides of his youthful dreaming. Love for his mother was his deepest passion in those days. Happily she was left to him for many years. A letter written to her on his journey in Europe is framed upon a wall of the room where he wrote much; it shows the longing of his heart to be with her 'at thanksgiving time,' and is very touching. He saw with deep regret the last great Portland fire, that of 1866, which had no heroic beginning, but was the result of a very common accident. A small boy playing with fireworks on the Fourth of July in that year managed to kindle a blaze in a boatbuilders' workshop which spread over so much of the town that traces of the damage it wrought still remain.

But again the town has recovered herself, and now her public buildings are on a par with those of her more 'hustling' sisters. For there is a fine flavour of aristocratic feeling about Portland. She is by no means a 'smart' city. She has her old residences still inhabited by the descendants of the merchant princes who built them. The elms in State Street shelter many stately homes where old traditions are strictly preserved. Although thoroughly American, if the Forest City were on the other side of the water her politics would be termed Conservative. She is a highly respectable town. The thirsty outsider would in vain seek for a bar whereat to quench his thirst—that is, if he did not quite understand how such matters are managed in secret in a prohibition town! One of her respected citizens said proudly to a visitor that not one of certain youths he knew had ever seen a bar, an assertion which provoked the unexpected reply, 'Just imagine their delight when they do see one!' which showed that the speaker had some insight into human nature.

There is a bronze statue to Longfellow in the town; and other distinguished natives were N. P. Willis, Sara P. Parton (Fanny Fern), Commodore Preble, Neal Dow, and Thomas B. Reed.

## THE POTTER.

The wheel is whirling—let it whirl!
All the day they go and come,
Cups like sapphire, pots like pearl,
Shapen by the skilful thumb.
Cups like sapphire, pots like pearl,
All the day they spin and whirl:
For the potter knows the clay
Must his mastercraft obey.

My wheel is swaying—let it sway!
Whirling pass my pots of pearl;
Bright and dark, from day to day,
Sad and sweet, they spin and whirl.
Bright and dark from day to day
My jewel-vessels whirl and sway:
But the Potter knows His art,
While He turns and shapes my heart.

By Lettice Milne Rae.

BY the side of a grassy upland slope, such as is to be found in the shire of Oxford, stood a little wayside chapel. It had stood there for many long years—from Anglo-Saxon times, some said; while others maintained that it had been founded by a Crusader as a thank-offering for safe return from glorious victory. Whatever its age or date, it was certain no man from that country-side answered the call to battle without first lighting a candle or offering a prayer at that shrine, which was dedicated to Our Lady of Victories.

Now, the chapel, though so obscure a place, possessed a great prize. Whether bestowed by its pious founder or by some other none knew; but there, in a corner to the right of the altar, stood an old oaken reading-desk, and on it, firmly secured by chains so that none might take it away, lay a copy of the Scriptures written in Latin. But it was as a pearl before swine, for few who came to worship at that shrine could read, and fewer still could read the Latin tongue.

Our Lady of Victories lay less than two leagues from the township of Oxford. That mistress of learning was then in her childhood, and had but three colleges, the latest founded being named the College of the Queen or Queen's College, in honour of Philippa, consort of Edward III., the reigning king of England. The new college already possessed a goodly number of scholars, and was even honoured by the presence of the king's son.

One mellow October afternoon in the year 1345 a scholar of Queen's, a tall, spare youth, might have been seen making his way along the path that led to the shrine. The autumn sunshine was still warm and bright, and gilded the leaves on the trees which rustled in the cool breeze, some falling at the feet of the youth as he walked with a quick, firm step that betrayed a keener vitality than his appearance warranted. His face was pale and thin and worn with much study, but it had a look of earnest purpose; and his eyes shone with the light of an unconquerable spirit, though his back was bent, and his scholar's gown was old and threadbare, covering a poor and shabby tunic.

As he came nearer the chapel his step quickened and his eye brightened. Doffing his cap, he entered the low doorway; and, although a man of peace, he knelt at the altar and prayed that he might have victory. Then, crossing to the old reading-desk, he opened the precious manuscript and began to read. There he stood reading intently till the brief sunlight of the October day faded, sometimes copying pages of the book on to a bit of parchment which he drew from his wallet. So absorbed was he in his task that the entrance of another pilgrim to the shrine passed unnoticed.

The new-comer was a youth goodly to see, tall and handsome, somewhat younger in years than our student. His limbs were strong and lusty with the strength of boyhood; his black curling hair hung on either side of his proud, fearless face; his dark eyes flashed with ambition, and in their depths lurked both tenderness and cruelty. He also wore a scholar's gown over his rich and sumptuous tunic. His bearing was noble, but he bowed his haughty head in all humility before the altar as he knelt to pray for victory, and was full of young hopes, for he was soon to go forth to battle with life and the enemies of his country, to win his spurs, and to make or mar his name.

Long he knelt before the altar in lowly supplication. Then, as his gaze wandered from the image of Our Lady of Victories, his eye lighted on the figure at the reading-desk still bending over the pages of the great book. He watched the reader for some time. Something in the pale face attracted him. Here was another youth with hopes and dreams very different from his doubtless, but yet a seeker after victory.

But now the last rays of the sun had died away, and the chapel was almost in darkness. The reader could no longer see the closely written pages. Rolling up his parchment, he replaced it in his wallet; and, making a reverence, he left the shrine, and slowly

[*All Rights Reserved.*]

walked along the path towards the town, dreaming dreams and seeing visions.

The young worshipper remained alone for some moments; then he too passed out into the darkening night. After following the scholar for a little distance, he quickened his pace and soon overtook him. 'Good-even, friend,' said he. 'Ye go to the town? Art scholar there?'

'Ay, of Queen's,' answered the other.

'Then we be fellow-scholars. I also am of Queen's. If it displeaseth thee not I shall bear thee company, that we may beguile the way, for the moon hides her face to-night and the road be dark.'

'Right welcome are ye, Sir Stranger. I fear me I shall prove but a poor companion, being a simple scholar and not given to much speech.'

'But to much thought, Sir Scholar, and a man not without ambition, methinks, in spite of his few words,' interposed he of the fine tunic.

'Ay, sir, ye have guessed aright; I have my hopes and dreams. How came ye by that surmise?' asked the student, glancing questioningly at the youth.

'I saw ye at the shrine of Our Lady of Victories, and I read thy face, Sir Scholar. I know that hunger in your eyes, for I have felt its pangs. But the day draweth nigh when I shall be free to cast aside books and parchments, and go forth to wield a sword in defence of my country.'

'So thy desire is the glory of arms, good youth?' said the scholar gravely.

'Ay, sir; and what better desire can a man have than to couch a lance or break a spear for home and country, to uphold the right and protect the weak as a true knight?'

'Ay, Sir Warrior, 'tis a noble thing to defend the right, to uphold the oppressed and down-trodden, to fight against the enemies of England; but there be subtler weapons, good youth, than the sword and the spear, weapons that can be wielded even if the body be weak and the sword-arm feeble.'

'Speak ye of the dagger of the assassin or the powder of the poisoner?' asked the knight-aspirant with scorn and horror in his voice.

'Nay, nay, good youth, these be foul means,' answered the student. 'The stab in the dark and the poison-cup are for dastards and cravens. The weapons I think on are fair and honourable, more powerful and more far-reaching—ay, and making for more lasting peace, if wisely used, than the sword or the spear.'

'What may those weapons be, good sir?'

'The tongue and the pen,' replied the scholar quietly.

'The tongue and the pen!' laughed our warrior. 'These indeed be weapons for the scholar and the man of peace. But how defend our hearths and homes by such feeble means?'

'Good youth, no man can judge their strength; they are like arrows shot into the air, flying for great length, and then striking, man knows not always how or when or where, but ofttimes striking deep.'

'Ye liken it to an arrow, but can a pen overwhelm the enemies of our country as our trusty bowmen? Can the tongue alone redress a wrong, Sir Scholar?'

'Ay, Sir Warrior, the greatest enemies of England cannot be slain by sword or spear; for they are not corporal—they are here in our midst, within our homes and our monasteries. The corrupt life, the hardened conscience, the sins of sloth and greed, oppression and cruelty, superstition, ignorance, and error—yea, even error in the Church herself—are greater foes to our country than the armies of France.' And the scholar's voice rang out on the still night.

'Ye are bold, Sir Scholar,' cried the youth with a sudden glance at his companion's face as it gleamed in the darkness, and admiration and surprise were mingled in the glance.

'Ay, sir, for I too would serve England, and fight for truth, honour, and freedom, and I fear not to attack her enemies whatever or whoever they may be. I hope to be as bold and strong as any soldier in the king's army, for I shall fight under the banner of the King of kings.'

'Methinks, Sir Scholar, that our king loses a valiant warrior if ye remain among pens and parchments. Would ye not rather be in the battle-charge, to feel the heart beat high and the blood course swiftly through the veins? Think of the glorious onset sweeping down the foe, the shout of victory—a sound worth hearing—and the banner of England borne aloft, floating proud and free!'

'Nay, nay, good youth, such glory in warfare is only in dreams. War must ever be hard, cruel, and terrible, and should only be waged for the righteous maintenance of national justice, peace, and safety, not for the love of power and glory and self-aggrandisement. These wars with France are no national quarrel. I fear me our king seeks his own cause when he leads his armies against the French king, and not the right and might of England.'

'Methinks ye are over bold to talk thus,' cried our warrior hotly, and his haughty face looked dark. 'Ye are but a simple scholar; what can ye know of the king's wars? Cannot the cause be for moral good as well as the glory of the realm? Would ye rather that men sat at home in idleness and ease, wasting their manhood in petty quarrels and tavern brawls? Is bull-baiting or cock-fighting a better pastime than following the king, lead where he will and in what cause? Then indeed would sloth and greed rule the land, and men would be at the throats of their brother-men for lack of better sport. Nay, the king would raise a nation, strong and free, welded together in loyalty, that Englishmen may be as brothers, Norman and Saxon as one, all the old feuds forgotten in the love of country and the desire to serve her. How better can a man learn this than by following his king to battle, fighting shoulder to shoulder with his countrymen, learning endurance and hardihood, facing privation and danger, even death; and not the bowmen and

yeomen only, but the knight and the squire, lord and retainer, nobles, princes, king, all striving for the same end and for the love of the same Motherland?'

'Ay, good youth, ye speak well,' returned the scholar gently. 'May ye be the noble warrior of your dreams, and serve your king and country with valour and with victory. England hath need of both the sword and the pen, and her soldiers must be fearless and dauntless, strong to attack evil and error, whether in king or people, pope or prelate. And God defend the right!'

'And grant ye your victory, Sir Scholar, for ye have a warrior's heart beneath your scholar's gown. We are now within the town, and I must bid ye farewell and seek my lodging. I thank thee for thy company, and shall remember thy words. Tell me thy name, that I may know it when the fame of thy conquests by pen and tongue are spread abroad.'

'John Wycliffe,' was the answer.

'Then, John Wycliffe, farewell. If ever ye would wield the sword rather than the pen, seek out Edward Plantagenet and remind him of this walk from Our Lady of Victories on St Crispin's Eve;' and, having spoken, our warrior disappeared into the darkness.

'My lord the Prince!' gasped our scholar, amazed, as he peered through the black night and heard the retreating footsteps.

John Wycliffe, first translator of the Scriptures into the mother-tongue, and first English reformer; Edward the Black Prince, the great soldier, the hero of Crécy and Poitiers—both loved and served their country, and was not victory theirs? Let England, mighty and Protestant England, say!

---

# LAURISTONS.

## CHAPTER IX.—HOW THE MARQUIS LOOKED TO HIS ARMOUR.

IN his own apartment in the small house in Queen Street, M. le Marquis de Montessonne, habited in a very ancient dressing-gown, with a coloured silk kerchief twisted like a turban round his little, bald head, was deep in his preparations for the evening.

On various pegs about the walls hung his black velvet coat, his knee-breeches, his beautifully worked waistcoat. On the bed were his lace ruffles and neckcloth. Below it, his silver-buckled shoes shone like mirrors. On the plain chest of drawers, from which he had just carefully extracted all these things, stood his dress-wig, on a stand by the small looking-glass. He was going over each article with critical care, as a knight of old inspected the armour on which his life might depend in the coming fray.

It was the top front room of the house, and boasted two small windows. Etienne's room at the back and the staircase occupied all the rest of the storey. Monsieur's room was not large, and contained no superfluity of furniture. Etienne's was smaller still, and contained still less. Both rooms were, however, scrupulously clean and neat. It did not take very long of a morning to put them to rights.

M. le Marquis's thoughts were concentrated on some of life's problems. His face showed it, and his lips. When he examined the long black velvet coat, with its great flapped pockets, you might have thought the trouble lay there. But it did not. The coat was immaculate, and the waistcoat, and the breeches. The beautiful lace ruffles, indeed, presented something of a problem, and might sufficiently account for the pinched brow and pursed lips, for here and there the critical eyes had detected a tiny lapsus. And yet, so exquisitely delicate was their texture, and of so intricate a nature, that to the ordinary—and certainly to the general masculine—eye they must have remained undiscovered. But the marquis knew that lace as he knew his family tree—with which, indeed, and the family fortunes, it had been somewhat intimately associated. And the flaws annoyed him, even though they might be known to none but himself; for in lace, as in the more important departments of life, a stitch in time may save much labour later on.

He produced from the top drawer of the bureau a needle and thread; from a tiny corner-cupboard a small glass containing a spoonful of coffee, which he proceeded to dilute more and more, with careful comparison with the lace, until it was no more than tinged water. Then he threaded his needle deftly, as one to whom the delicate operation was no novelty, drew his thread through the attenuated decoction, and left it to dry for a few minutes, while he gave a fresh twist here and there to the flowing curls of the wig with his long white fingers; discovered a tiny hole in one of his black silk stockings, and darned it neatly; gave a final polish to the silver buckles of his shoes; found a slight abrasion on one shoe, and healed it with an application from a tiny blacking-pot and gentle rubbing; and then washed his hands and set to work on his discrepant laces.

Judging by his face, the task was no easy one; but in fact he was looking a long way past it. The holes in his laces were not the only ones that would be visibly none the worse for some careful patching, and at times these more serious shortcomings and their possible reparation held him contemplative, and the long fingers would dally and the needle remain suspended, or prick lightly here and there inconsequently, as though probing possibilities and endeavouring to gauge whither they might lead.

Ludicrous enough the little gentleman looked, perched on the side of his bed, with his fantastic

head nodding now and again like a china mandarin, and now fixed in steady introspective stare.

The loose ends of his turban had broken loose, and flapped when he nodded like the ears of a prize rabbit; but his thoughts were too deep for diversion by matters extraneous, and the comicality of his appearance would not have disturbed him in the least had he known it.

His task satisfactorily ended, he assumed his ordinary workaday coat and wig, and went downstairs to drink a dish of tea with Mr Sax, of whose arrival home from the bank the front-door knocker had just given unmistakable warning.

His chair was waiting for him at the side of the table nearest the fire. Mrs Sax had placed him there that first January day when he came in from the bank with John, looking small and shrivelled with the cold, and he had occupied that place ever since. When the boys were there they sat opposite him, and the table was not of such a size as to make Mr and Mrs Sax at the head and the foot feel very far apart.

'Ah, *mon ami*, you tear yourself from the great affairs to waste the time that is money in feasting and revelry. But it is marvellous!' was the marquis's jovial broadside as he bowed elegantly and sat down.

'I have known great affairs carried through even in such places, M. le Marquis,' said John Sax soberly.

'Ah, ha!' chuckled the marquis with a quick glance at him. 'You men of affairs are never satisfied.—What a race it is! Does he not also dream affairs all night long, madame?'

'I have known him do that, mussure,' said Mrs Sax with a smile. And if the sharp eyes of the little Frenchman had been on the lookout they might have noticed a momentary tightening of John Sax's jaw, and the look of relief that eased it as she added, 'But not for a long time now, I'm glad to say. I think he comes home too tired to do anything but sleep sound all through the night.'

'And the bank is still there?' joked M. le Marquis.

'Still there, monsieur, or was half-an-hour ago.'

'And I wager, in the press of greater matters, you forgot to order the chairs.'

'How much?' asked John Sax, to humour him.

'Ah, then, I withdraw. You are not a safe man to wager with.'

'I never made a wager in my life.'

'*Parbleu!* to think of it!' with an expressive shrug. 'But, in truth, one can live without when one has to. But, yes,' he said with a reminiscent nod, 'it is extraordinary what one can do without when one has to.'

Had he not proved it in his own person, he—Marquis of France, with half-a-dozen great châteaux in various 'departments,' as they called them now, with servants innumerable and lordly revenues—five years ago? And since—and now! Still, it was impossible for him not to remember at times that there was one thing he had not had to do without, as so many of his friends had had to do—and that was the power to remember at all, the power to think, even to themselves; the power to keep their heads on their shoulders.

'Won't you eat something, mussure?' urged Mrs Sax, seeing that he only sipped his tea.

'Nay, madame, I thank you. But it were waste at both ends to eat now, and again at the banquet. 'Twould be but wasting your substance and my opportunity. With your permission I will hold myself in reserve, in justice to Sir George's *chef*, with whose quality I am well acquainted.—You expect some bright particular stars to-night, Mr Sax, is it not?'

'The Governor of the Bank of England is to be there,' in a tone of mingled pride and awe, 'and Mr Fox, and the Lord Mayor of course, and possibly Mr Pitt.'

'Ah, ha! But we are highly honoured! Well, honour where honour is due. And when does our good Sir George become My Lord?'

'Ah!' said John Sax with a non-committal nod which might equally cover knowledge or ignorance.

'And our hostess to-night? Is it mademoiselle or madame?'

'Miss Lauriston has come up from the country. I have just taken her her jewels from the bank. Mrs Charles's health has not permitted of her coming.'

'The pity!' and yet there was a savour of satisfaction about M. le Marquis's acceptance of the news. 'So sweet a lady! It is grievous to have such poor health.'

'It is that,' said Mrs Sax. 'And so good and beautiful a lady, too. If ever any one deserved the very best of everything, it is our Mrs Charles.'

'Truly!'

'And Mr Charles, he's another that deserves as good. There's not many like him.'

'If only blind Fortune gave us all our deserts!' murmured monsieur regretfully.

'We'd not have had the pleasure of knowing you, mussure, maybe,' said Mrs Sax complimentarily.

'The loss would have been equally mine, madame. One learns in adversity what good fortune never succeeds in teaching one. When the wheel turns once more in our favour some of us may have learned our lessons, and, for such, life will have the keener flavour by reason of abstinence.'

'I'm sure I wish you'd take a bite before you go, mussure,' said Mrs Sax with concern. 'It'll be quite eight o'clock before you get anything, and may be half-past if any of the big people are late of getting there.'

'I will pay Sir George the greater compliment of bringing to his table an absolutely unblemished appetite. In anticipation I already enjoy the masterpieces of his *cordon bleu*. Sometimes,' he moralised, 'the pleasures of anticipation are greater than the actual realisation.'

'You're sure of a good dinner,' said Mrs Sax. 'Sir George spares no expense. His dinners are quite the talk of the town.' And then to her husband: 'Remember to unscrew the knocker before you go, John, or maybe it won't be there when you come back!' Not that the knocker was in any way unique, unless perhaps in the extreme brilliance of its polish. But knockers, even of modest pretensions, cost money, and long and sad experience of the ways of young men about town had taught Mrs Sax that, after dark, a knocker unscrewed and lying in the passage was worth many knockers on the outsides of doors.

Mrs Sax, as you will have perceived from the foregoing, was of a kindly, matter-of-fact turn of mind, and M. le Marquis rather enjoyed his discussions with her, in which she kept safely on solid ground while he played airily round their subject in a lighter atmosphere. And John Sax, as a rule, sat listening quietly, with no more than just a word now and again to show that he was of their company.

And sober enough the little house would have been at times lacking M. le Marquis and the boys. Monsieur, indeed, was inclined to think it had grown even more sober this last year or two, and that in spite of his efforts at enlivenment. And from that he deduced the fact that, in middle-class life in England, after a certain age the wine of life loses its sparkle and becomes flat and insipid; so different from France, where, *ma foi!* it is when the follies and cares of youth are past that life waxes to its fullest, and increase of years and knowledge but add a finer edge to one's enjoyments and a broader base to one's privileges.

---

### CHAPTER X.—HOW CAPTAIN CHARLES WAS GOOD TO LOOK UPON.

ITH most polite punctuality, M. le Marquis and Mr Sax descended from their chairs in Grosvenor Place a few minutes before eight o'clock, and were greeted at the head of the great staircase by Sir George and Miss Lauriston, who stood there in state to receive their guests.

And a very good specimen of a fine old English—British, one should say, since he was of Scottish descent, though the distinction was not at that time so minutely insisted on as it is now—gentleman was Sir George. He was well over man's allotted span, and in his five-and-seventy years had seen some trying times in the financial world. But he was tall and stately still, and if a slight bowing of the broad shoulders told of burdens stoutly borne, his genial smile and strong, alert face seemed to discount any undue pressure from them. A man of immense financial knowledge and resource; a man who had known how to turn to advantage even the lean years that had resulted disastrously at times to others; a man whose unblemished business career inspired universal confidence and was now enjoying its well-earned honours and its very solid rewards. So said all the world, and when all the world says a thing there is generally some foundation for it.

And Miss Lauriston seconded him to perfection. Her tall, full figure, sumptuously arrayed and blazing in her mother's jewels, her face animated and gracious beyond its wont, Aunt Charlotte, thoughtful of her position as hostess and for the time being stirred out of herself, was good to look upon. She had come safely through the dangers of the road. In spite of Master Charles and Jerry MacClootie, no highwayman had molested her, though she had been on the anxious lookout for him from the moment they crossed Ealing Haven and took the high-road by the Common.

There was in her face still a sense of successful enterprise; in her manner and bearing the conscious satisfaction of sumptuous attire and ample means. On an occasion such as this Miss Lauriston never forgot that she was a wealthy woman in her own right. Her mother's fortune had grown immensely, and was still growing, for she never spent anything like her income.

More than one who came up the wide staircase, and saw her beaming above him, said to himself, 'Gad, but it might be worth while having a shot at her yet! She don't look her age, and she's rolling in money.'

John Sax received a friendly nod and smile from host and hostess, M. de Montessonne the more impressive welcome suited to his rank in life and very agreeable to his present circumstances.

'M. le Marquis, you honour us with your presence,' said Sir George, with a warm shake of the thin white hand in its priceless laces.

'The honour and the pleasure are mine,' said M. le Marquis, raising the tips of Aunt Charlotte's fingers to his lips with inimitable grace, and passed on with a touch of elation in his face at the gentle pressure that had rewarded him.

In the room beyond he became immediately the sparkling centre of a lively circle, through which, and from which, jokes and laughter flashed and coruscated like sparks in a November bonfire.

It was Mr Fox who took him by the arm just before dinner was announced, saying, 'Of a truth, M. le Marquis, it seems to me that you grow younger every time I see you.'

'It is a faculty we cultivate in France, monsieur.'

'Among other things! What is your latest news from—shall I say home?'

'Home assuredly,' said the marquis quickly, 'though for the moment in the hands of the Philistines. My news is not good. The night is still dark over there.'

'General Bonaparte carries all before him. He is a mighty warrior.'

'As a warrior I cannot but admire him. As a revolutionary I detest him. He is the devil. But he will pass like the rest.'

'You hope to see the end of him?'

'Assuredly. Our turn will come again. It is only a question of time.'

'You teach one faith and hope, M. le Marquis, and, damme, one needs all one can carry in these times! He is a wonderful man, is General Bonaparte.'

It was a very grand dinner, and there were some very great people there. For the house of the wealthy banker, whom all delighted to honour, was neutral ground, where political opponents could drop their masks and foils for a time, and meet in such fellowship as their temperaments and the ardour of the game had left them. There the mighty lions of the two Houses could purr soft nothings into opposition ladies' ears, and even greet one another with a lack of resentment restorative of faith in human nature, if somewhat productive of doubt as to the genuineness of their roarings elsewhere. There their mates could restore the balance of parties, quite to their own satisfaction, in ways not observed or understanded of men. And there the younger members of their families could watch with awe the familiar intercourse of the Olympians whose names were household words with them, and between times could make eyes at one another and form intimacies which sometimes ripened into closer fellowships and odd combinations. It used to be said that more matches were made at Sir George Lauriston's than at any house in London, and I suppose it was true.

That night, by reason of the Princess Royal's wedding a few days before, the rooms were thronged with an unusually brilliant crowd. The Ladies Frances Somerset, and Mary Bentinck, and Caroline Damer, and Mary Howe were there in their bride's-maids' dresses, all very gay and by no means unconscious of their supreme social importance. And there were Ministers and ex-Ministers, and future Ministers, and foreign Ministers galore. For this was a house where all liked to visit, and the operations of the greater house, of which it was but an ornamental adjunct, were far-reaching and wide-spreading.

Strolling quietly among the gay throng, with a smiling welcome for and from every man he met, and for the ladies, young and not so young, a graceful word of greeting which left a trail of bright faces in his wake, Captain Lauriston was doing his part as usual in making his father's guests feel most comfortably at home. He was tall, square-shouldered, and of most distinguished bearing, and still carried with him more of the soldier than the banker. His strong, clean-cut face, however, readily as it broke into smiles, had in these last five years taken on somewhat of the sober control of the man of affairs. And that was a look that became it well, for it was the face of a man born to win the confidence of his fellows, from the steady, deep-set eyes to the firm, tranquil mouth; the face of a man to whom, in times of trouble, other men would turn instinctively with full assurance of such wise advice and assistance as its owner had to give, and with the certainty that, end the matter well or ill, the course recommended was without doubt the one he himself would have taken. A strong, high face, full of quiet determination; the face of a man who, having decided his course, would go through with it to the end, though the end were death itself; the face of a man who would carry his burden without complaint, and would show no sign though his way should lie through the valley of shadows.

Look at him well, and rejoice in him for a moment if you can, with the high light in his eyes and never a shadow in his path; for hereafter we shall see him in very different case.

*(To be continued.)*

---

# THE DECAY OF THE SUGAR-INDUSTRY.

By C. M. Hale.

IT is hard for those whose duties keep them at home, and compel them to gain their knowledge of the progress of events through the medium of the printed article, to realise the evil days on which the once flourishing sugar-industry of Demerara has fallen. Brown sugar is not quite such a common article upon our tables as it was twenty years ago; but, if any thought is given to the matter at all, it is concluded that the reason is to be found in the popular preference for the whiter and apparently purer product, and, in a measure of course, this is perfectly true. But if any one with a taste for statistics were to discover what percentage of the sugar consumed to-day is cane-sugar from British colonies, and what percentage is subsidised foreign beet-sugar, he would probably begin to get some dim conception of the state of affairs.

Before going farther afield, let us consider the state of affairs at home in one town only. Thirty years ago there were three sugar-refineries in the port of Bristol. Three years ago there were none. It might interest our political economists to calculate how much labour, directly and indirectly, a refinery employs, multiply it by three, and see how the total compares with Bristol's unemployed. The result would probably suggest more than one reflection.

But to go to the source and seat of the decay, the colony of British Guiana, better known by the name of its principal county, Demerara, alone presents us with facts at which to pause. In the whole colony there are not more than forty sugar-

factories. Within the memory of living colonists there were at least double the number. Amalgamations have accounted for some, but by no means all. Early in 1909 one of the largest and most important, Plantation Windsor Forest, on the west coast of Demerara, was abandoned because there was not the money forthcoming to keep the sea-defences in repair. In June, Plantation Het Vergenoegen, on the same coast, was sold at auction, and turned by its purchaser into rice-land. Shortly afterwards Plantation Skeldon, on the Corentyn River, distributed three allotments of its indentured coolies among neighbouring estates because it was found necessary to cut down expenses.

It is not as if these estates, which are only selected as typical of many others—Springlands, Highbury, Zeelandia, New Forest, among them—were new ventures or the property of bubble companies. Far from it. Het Vergenoegen, as its name shows, dates from the days of the Dutch possession, while the others were all properties of over forty years' standing, to make a very conservative estimate. Their failure was due to no sharp finance or questionable stockbroking; they simply perished under the general blight that is rapidly destroying the whole industry.

Wherever one goes one sees the obvious and deplorable signs. Villages are built on what, to trained eyes, are the unmistakable drainage systems of cane-pieces. The very place-names are the titles of dead and forgotten estates. Land believed to be virgin soil, grown over with bush and jungle, time and time again on being cleared reveals the rows of parallel drains and fourfoots, side-lines, and middle walks that speak eloquently of a departed prosperity.

Over the whole colony is the same stamp of decadence. On the island of Wakenaam, on the Essequibo River, there were at one time eleven sugar-factories. One remains, and the chimney of another serves as a landmark and guide to the somewhat uncertain river-navigation. Again, as one drives or rides along the west coast road from Vreed-en-Hoop to Tushen de Vrieden, there is to be seen one of the most eloquent testimonies to the general decay. Just as the road turns into the village of Meten-meer-Zorg, there lies, by the weed-choked remains of what was once a mill-dock, a complete cane-mill, with three rollers and a beam-engine, all grown over with corilla-vine and creepers. It marks the site of a closed factory, and is, though perhaps the most conspicuous, by no means the only one of its kind. There are other similar remains at Canefield and Adelphi. Had there been any shred of vitality in the industry the mill would have been sold long ago. As it is, no one even bothers to steal it piecemeal.

These, then, are the outward signs of the inward decadence. Some of its results are even more deplorable, but we shall only touch upon one before going on to the cause and the prospects of recovery, and that one the most terrible of them all.

The sugar-industry employs a considerable number of white overseers, chiefly Scotsmen. In the days of its bygone prosperity, when situations as managers, deputy-managers, and head-overseers were plentiful, this industry held many fine prospects; but now that, with the yearly shutting down of estates, these openings become proportionately scarcer and overseers' salaries smaller, the chances of marrying and settling down become less also. The attendant social evil would be inevitable in any country; very little reflection will be necessary to perceive the stages to which it has grown in a colony where Europeans are placed in a position of peculiar power over two-thirds of the inhabitants.

Apart from the sugar-industry, British Guiana is a colony of immense, and at present scarcely developed, resources. The soil is unusually fertile, and is, according to the analysis of the consulting chemist at Plantation Albion, richer in sulphates and phosphates than that of Louisiana and similar districts. The minor industries, the production of rice, rubber, citrate of lime, and sisal-hemp, and cattle-farming, only require capital to spring into prosperity. At present what capital there is is mainly American, aided by the indefatigable industry of those invaluable colonists, the Creole Asiatic Indians; and herein lies the great danger, that of American dominance, which it is the interest of every imperial-minded Briton to combat when it threatens a British colony. Indeed, the prospects and future of the Demerara sugar-industry, on which the colony depends at present for its existence, should occupy the attention of all Britons, from whatever point of view they choose to look at it. Patriotic and imperial motives apart, the colony is far too valuable to lose. Half-developed though its minor resources are, and in spite of the decadence of its mainstay, the sugar-industry, it is quite prosperous enough to be self-governing. How long it will remain so, or even remain a part of the Empire, depends very much on the measure of assistance which the mother-country is prepared to extend to its main industry, on which, as before stated, its continued existence hangs.

What, then, are the causes of the decay? One main factor, on which two minor factors hang: first and foremost, the competition of foreign beet-sugars in the English market, which has driven Demerara sugar to America; secondly, the juggling with market prices in America, which compels the planters to sell at the price that is offered, and not always for what the sugar is worth; and, thirdly, the well-meant efforts of the internal Government of the colony to stamp out the social evils consequent, as before explained, on the decadence of the sugar-industry.

To take each in order, foreign beet-sugars have driven Demerara sugar from the English market and closed the Bristol refineries. These sugars, the manufacture of which in France and Germany is subsidised by Government, have an unfair advantage over the colonial article, which cannot be manufactured and shipped to Britain cheaply enough to compete successfully with the foreign sugars.

Here some may observe that though it is possible to take measures against the competition of the foreign sugars, the new home beet-sugar industry recently begun at Sleaford, in Lincoln, would prove an equally dangerous rival, and one which no man short of a fanatic would desire to see crippled. The reply is that it is not beet-sugar that has been fatal to the Demerara article, but subsidised beet-sugar. When it comes to fair competition between the two, cane-sugar has nothing to fear. There is room for both industries so long as the one is not subsidised against the other. Let the foreign competitor be excluded, and the two British products may vie with each other on equal terms.

Demerara sugar, then, is driven to the American and Canadian markets. Now, sugar, like every other product of the soil, has its seasons. The long grinding, as it is termed, lasts from September to the end of December; the short crop is taken off in June. Consequently the Wall Street financier and his Canadian counterpart can anticipate the entry of the sugar into the market, and, by methods only too well known to recapitulate, practically control its price, to their own gain and the planters' detriment. Lastly, the internal Government of the colony, by its stringent penalising of the combined outcome of low salaries and human weakness, is effectually and rapidly, if unintentionally, causing the disappearance of the experienced planters and the substitution of new, almost untried hands in their places; all of which things combine together to produce the closed estates and ruined factories that are a blot on the land, and engender the talk about reciprocal relations with Canada that is only a disguised disavowal of the mother-country.

These, then, being the causes, what is the cure? In stating our unshaken belief that the only cure is a smart protective duty on foreign sugars, we are conscious that we are treading contested ground, and running the risk of raising a storm of controversy; but a little quiet reflection will show that it is nevertheless the case.

If Demerara sugar could re-enter the British market the decadence would be arrested, a period of renewed prosperity be inaugurated, and a stop put to the wavering loyalty to the homeland at present disguised under 'Canadian reciprocity;' and if it is to compete successfully with the subsidised beet-sugar, it can only do so by means of a protective duty.

Immediately the cry arises, 'Dearer sugar for the working-man.' Perhaps it might be a halfpenny a pound dearer. But with all due deference to the great and far-seeing minds of political economists—who badly want to catch the working-man's vote—we beg to suggest that a protective duty would also mean more prosperity, less unemployment, and higher wages for the working-man, under which circumstances he could afford his slightly dearer sugar with a little more readiness perhaps than he affords his dearer tobacco at present.

The prosperity of the Demerara sugar-industry means the importation of more machinery, which means employment for the working-man. It also means more money in circulation and more luxuries purchased in the colony, hence more luxuries imported, from which it is not a very far step to more work in Britain. It also means the revival of the Bristol refineries, whose relation to unemployment has already been hinted at; and last, but not least, the almost automatic disappearance of the social evils which are making the colony a cesspool and a disgrace to European civilisation.

The writer will never forget the impression made on him on one occasion over a year ago, when his duties took him about a mile into the interior of the bush and jungle known as the New Forest. The main irrigation-canal of Plantation Rose Hall, an estate some seven miles distant, receives its waters from the Canje Creek at a little village called Zorg, about eleven miles from New Amsterdam; the reason for going this distance being the necessity of obtaining fresh water, not salt, for irrigating the canes. A narrow footpath, technically termed a 'dam,' ran along the side of the canal, which was bordered on both sides by almost impenetrable jungle, consisting mostly of chinchilla or sand box-trees, with now and then a sand-cocoa or a longjohn. Here and there the path widened to a little clearing sometimes as much as a dozen acres in extent, where were a few coolie *benabs* and mud huts roofed with straw obtained from the rice cultivated around them. The whole gave the impression of virgin soil laboriously wrung from the tenacious forest.

A twist in the path brought other and less hopeful evidence, however. The material underfoot had changed from earth to some gritty substance in which brick predominated. A few rusty molasses-tanks, the remains of an old punt, and the skeleton of a multitubular boiler showed their somewhat gaunt outlines from beneath the veil of ever-flourishing verdure that half-concealed them. But it was not this scene which chiefly arrested the eye, significant though it was. On the opposite side of the canal was a most magnificent forest, nearly sixty acres in extent, of tall, feathery cabbage-palms shooting up in some instances to nearly seventy feet. At the water's edge were the dim traces of a sanded path. And then came realisation. That splendid forest, which looked as if it had stood in its serenity for generations, had grown out of the line of palms that, not a generation ago, had bordered the carriage-drive to the manager's house at Plantation New Forest. There was something about the stately, silent grandeur of the trees that seemed to suggest a fitting monument over the grave of a departed greatness, and they served far more than desolate, weed-grown cane-pieces or rusting factories had done to give me an impression of what the colony once had been—an impression which has never been eradicated.

# THE FORGOTTEN ROCK.

## CHAPTER V.

Instead of shores where ocean beats,
I hear the ebb and flow of streets.

IT was blowing great guns in the North Sea when the captain kept his promise and gave Westwater to the deep, amid a waste of broken waters, canopied by hurrying clouds. The driving rain still whipped the decks. The baffled sea panted, chasing the *Covesea*, in hungry packs; but the crashing of her bows to their onslaught, the clamour of the wind, the cries of the tackle and sheathing, and the hundred hidden voices of shipboard were dying down. The *Covesea* had met the full strength of a Nor'-West gale; not the first nor the fiftieth that her skipper and she had weathered. Now she steamed, drenched, shaken, but safe, amid the lees of the storm, the gale half-spent and the sun plucking up courage again behind travelling banks of slate.

Flett wore the precious belt buckled round him. It had never left him since the moment when he took it from the unconscious Westwater on the Forgotten Rock. After the other man's death, the captain pretended to cast about for some solution of the scene on Midsummer's Eve other than the one that was forcing itself upon him. There were a hundred possibilities, he argued. The jewels might have been honestly there, the result of some legitimate joint adventure. Lord Criffel would have some simple explanation. Of course he would! Westwater's brain must have been overwrought. If the jewels had been stolen, why so much concern about their delivery to Lord Criffel? And so forth. Thus spake Charity, hoping all things.

Then the captain remembered, unwillingly, the cleft on the Forgotten Rock, the hungry, delirious glare in the man's eyes as he handled the jewels, the refrain of 'Eighty thousand pounds! Eighty thousand pounds!' the last scene on the *Covesea's* deck—the little tragedy, the unspoken cry for forgiveness. So Doubt fenced with Charity, until the call to arms of the rising wind in the rigging and a menacing sea had crowded all theories, all speculations, all thoughts out of the captain's mind other than those for the safety of his ship and crew.

Now, after he had been a couple of days in his oilskins, the *Covesea* safe and nearing the estuary of the Thames, his thoughts began to circle again round his mission with the jewels. What manner of man was Lord Criffel? he often wondered; until one evening, when the engineer and he had been discussing home affairs and Morayshire, a chance byway in their talk gave him a ray of information.

'Ye come from Speyside, Mac,' the captain had said. 'D'ye get some fishin' when ye're hame?'

'Whiles. I get a cast when the finnock are runnin'. The laird 's no' greedy,' replied Mac.

'Whose water is it?'

'Lord Criffel's; but my folk have had a croft there under three o' them.' There was a subtle suggestion, never very far below the surface of his type, that somehow he ought to have a right to the fishing as well as the laird.

'Lord Criffel!' and Flett could not avoid a slight start. He went on in an elaborate unconcern: 'Man, it runs in my head that I saw somethin' aboot him in the papers—was it last year?—somethin' aboot a jewel-robbery.'

'Ay, like enough you would. Her ladyship's rubies. I forget the ins an' outs o 't, but they were cleverly stolen on a railway journey. A bonny fortune in them! Scotland Yard was never in the hunt, an' I 'm thinkin' the Earl will never see the rubies again.'

The captain thought diametrically opposite, but deemed it unnecessary to say so.

'Maybe no',' he replied abstractedly; 'maybe no',' as Mac went below to the noisy beloved companionship of his engines.

The storm died, and in due course the *Covesea* took her modest place in the procession up the Thames. The captain saw her in dock, cleared his papers, and after engaging a room at the Baltic Hotel, had his stereotyped interview with his owner's agents. There with a boy's delight he learned that he would have ten days free before he sailed again, and therefore time to run home to Findburgh. This was Saturday. He would go home to-morrow—after his meeting with Lord Criffel. So he thought as he descended the steps of the agent's offices and stood for a moment framed in the solid commercial doorway, in a street swept by fierce currents, about him the enveloping roar of London.

Flett watched the stream. Those in the current were all in a deafening, monotonous hurry; most of them anxious, many of them callous, many sad-looking, as though their eyes said, 'We must hurry! We must live, mustn't we? We must keep afloat somehow, anyhow. We are part of a System.' Full-blooded, sleek ogres, top-hatted, pig-jowled; white slips of starved typewriters; hunted-looking clerks; low schemers; pitiless, razor-faced trackers; a poaching hansom on the prowl; a multitude of frock-coated, lunch-in-a-hurry, old-eyed youngsters; a millionaire playing for huge counters; a creature near him in abject rags, one-armed, hawking matches on the kerb for a perilous profit of a few coppers a day, exchanging a mirthless jest with the lady of the orange-stall—all of them, cabman, plutocrat, tatterdemalion, owning a common denominator in the wary and considering

eye of commerce. An arresting yet colourless medley, this pitiless welter, this gray, everyday tide-roost of humanity, where broken men and women, in the awful parlance of the System, 'go under,' and are forgotten. The captain, glowering at them with his clear eye, his voyage-tanned face, his big square figure on the steps above the ruck, looked by comparison like some defiant Incarnation of the Open Air. His eyes swept the crowd, and he instinctively felt for the belt round his waist. It was safe.

'Hugh!' He was startled by a slap on his shoulder. 'This is lucky! I heard ye were here, this mornin'.'

Flett turned, to see a genial Aberdeen skipper.

'Hallo, Duncan! Glad to see ye! Where 's your ship?' said Flett, and shook hands heartily. The two drifted at once into sailormen's talk; and Duncan, at a loose end, promptly suggested an adjournment for a whisky-and-soda.

'Na, man, I canna,' said Flett, remembering his mission and Lord Criffel. 'I've somethin' to do this very afternoon, an' I 'm off north to-morrow.'

'Ye're surely in a desperate hurry,' quoth the Aberdonian, and urged that they had not met for a year or two; there were three or four old friends who would rejoice to see him at 'Andrew's,' a Scottish hostelry in Aldgate then well known to the North Sea captains; the Sunday train north, after Edinburgh, was a slow one. Why not wait till to-morrow, unless, of course, he had an appointment to-day?

Flett hesitated. After all, he reflected, he had no appointment. There was something in what his friend said. There was no great hurry. He had not been in London for years. The meeting would do well enough to-morrow. He would call at Cromdale Square next day, tell his story, hand over the rubies, and then Northward Ho! to-morrow.

Yes! He would put it off until to-morrow; but as he changed his mind he instantly became aware of a slackening of his mental cables. A shadow of disloyalty to Westwater's trust touched him. He could not define it. Unused to self-analysis as he was, his mind tuned in the main to open and simple issues, the ripples of less than uneasiness more than inquisitiveness on his mental surface stirred him curiously. Introspection was novel and disquieting to him, raising a subcutaneous tingle of irritation. There was no reason, he said to himself, why he should gallop post-haste to Lord Criffel with the rubies. After all, his trusteeship was self-imposed, at least voluntary. He might have refused it. At any rate, he was doing his lordship a favour.

'All right, Duncan, I 'm your man! It will do to-morrow,' he said suddenly. Still, as he sauntered along, trying to listen to the Aberdonian's gossip, he was absorbed, almost querulous, conscious of some vague self-indictment. However, he would certainly go to Cromdale Square to-morrow.

Ah, to-morrow! Procrastination may be the Thief of Time, but he is the mildest-mannered vice that ever scuttled man. He presumes a deal on his far-out poor relationship to the virtue of Good-Nature. And he has a way with him! So has a cumulative poison. None so insinuating as he. Recklessness takes your arm in summer for a pleasant bit of the road, till he suddenly leaves you lying bludgeoned in midwinter, and you hate him. Pleasure is a crafty usurer. You know that some day he will refuse to renew his bill, after robbing the clear eye, the hard muscle, the quiet mind, and you hate him. Love-of-Money beckons always a yard or two in front, until, near the end of the trail, you discover that you have no other company, and that, as one who has travelled by night, you have seen nothing of the scenery. But Procrastination, the smiling, ubiquitous vagrant, steals into your blood, and anticipates your mood. 'To-morrow the sun will shine,' you and he sing. 'Let us to great things to-morrow.' So you hob-nob with him only half-unwillingly, as one listens to an agreeable knave. Ah, to-morrow!

The two friends arrived at 'Andrew's,' and there met some of the masters of the Firth Line of Aberdeen, the Baltic and East Coast Line of Leith, and half-a-dozen other bronzed comrades. There was the good filling talk between sailormen of common interests and rare meetings: of freights and their vagaries, wages, the loading-line, German competition, the prices of bunker-coal, the prospects of promotion, p.p.i. policies, and how poor So-and-So went down with his ship last month in the Bay. There was also old single-malt 'Spey Royal' whisky, sound measure of it too, no degenerate London thimblefuls dispensed by haughty sirens crowned by peroxide in gilded buffets, but stalwart brown drams, ten 'under proof,' the veritable juice of the barley, fit libations for the strong heads and strong bodies of these sons of the red ensign. The hum of conversation, the company of his friends, and the 'Spey Royal' proved first aids to the twinge of the captain's conscience, and he joined in the talk and laughter until the bells of St Dunstan's boomed out a reminder that it was time for him to return to the 'Baltic.'

There he found two letters waiting him, one from his wife, full of local news and items of domestic politics; the other short, to the point, appallingly definite. It was from the agent of the Highland Bank at Findburgh. Thus it ran:

'Dear Sir,—I have to draw your attention to the fact that the period for which the cash-credit in favour of Mr John Main was authorised expired on the 15th inst. The bank's efforts to obtain payment or reduction of the amount by Mr Main have been unsuccessful, and I am instructed by my Directors to call upon you, as the co-obligant, to make arrangements for the payment of the advance within one month. The total amount, with interest, is £317, 16s. 2d.'

And the agent wound up with the polite but incredible statement that he was the captain's obedient servant.

The captain read and re-read the letter in a thickening mist of perturbation. Fights with the sea, the clutch of physical danger, held no terrors for him. He knew and understood them; but this new, unfaced, barely considered peril of the land fairly staggered him. He had become, for the credit of the family, security for his brother-in-law in a bad fishing year. One bad year succeeded another, and this bombshell of hard fact was the result. He dropped to a seat and read the frigid phrases over again, his big frame shaking. Three hundred and seventeen pounds sixteen shillings and twopence, within one month! That meant his whole savings and a little over. Not a great deal of money, perhaps, but his all, the outcome hardly gleaned from the toiling years, a barrier-reef between the hungry seas of anxiety and his islet of home, between bare, dull necessities, cramping parsimony, and a few bright luxuries for his wife and bairns. He sat stolidly for half-an-hour, scarcely moving, his numbed wits in a coil of perplexity, his thoughts moving in impotent, fruitless circles, back, always back, to the letter in his hand.

He was no fatalist. No instinct to take any reverse 'lying down,' to acquiesce and accept or blame Providence, had its dangerous root in him; but the money-world was to him an uncharted sea, known only in the beaten track of doing his best, drawing his pay, husbanding his money, and avoiding cross-currents and the unknown. His wits travelled slowly round and round the warning in the letter.

A nimbler mind would have conjured up possible ways and means, a more sanguine and resourceful one, some optimistic vision, some magic door out; but the sudden blunt issue deadened him. He could see no other road than the plain one, the devouring of his savings by the bank, the borrowing of a little more to save his own and his brother-in-law's name, at best a jury-mast to try to carry his maimed craft along into better weather. An hour passed, as he sat silently brooding, too unhappy to curse, listening to the callous ticking of the clock. Twenty city chimes tossed melodious answers to each other. Eleven o'clock! He remembered that he must go back to his ship and see that everything was all right on board for the night. He put the letter in his pocket, and after a half-an-hour's walk was once more on the *Covesea's* deck.

A hundred tremulous images of the lights of the shipping lit up the brown face of the hurrying river. Sudden voices rose on the night from belated boats threading their way through the craft; a police-boat on swift patrol answered another's hoarse call; the towering bulk of a liner moved slowly down-stream, vague and tremendous in the darkness. The captain watched her pass, and as he saw her lights gradually shrink and vanish, a sudden yearning gripped him, a yearning to put to open sea, to feel his foot on the bridge, to taste the satisfying urgencies of ordered thought and clear action; to hear the faithful heart-beat of the ship in her singing engines, watch her forefoot lift to the ocean; to fill his day with work and duty, and lay the ghosts of his unquiet mind. He paced the deck automatically. The blaze of the countless electric lights had gradually gone out, and their reflected night-glare lowered in the heavens, as though an Invisible Hand had swept the vast slate of the sky, leaving behind a powder of stars.

Sleep was refused him. The thought of it was as distant and impossible as though his ship lay blinded in the stealthy folds of a sea-fog instead of safe at her moorings in the Thames. He looked for a moment at the whisky-bottle, then moved away from some subtle danger, for he was in doubtful weather, and his sailor's instinct forbade the counter-brace.

The chimes notched another hour of Time. Sleep he must, he thought, and determined to tire himself out by walking. He bade good-night to the second-mate, stepped across the gangway, and stood for a moment or two listening to the voice of the night orchestra of London.

It was at the climax of its symphony, in a multitude of chords, continuous, vivid, challenging, contrasting, blending; in the rolling drums of the late 'buses; the near staccato notes of clipping hansoms; jingling harness; the sudden rush of unseen passing trains; the hum in many octaves of skimming automobiles; the whistles of tugs fussing homewards; owls of sirens hooting far off in melancholy minor wails; the mellow clangour of the bells chiming midnight; the voluble river; the rustle of a myriad footfalls; the flexible multitudinous murmur of human voices running counterpoints to the sense of majestic harmony struck in the rich full bass, the deep masterful undertone of the roaring surf of humanity threshing and beating in and around the great city.

He plunged into the more crowded streets, and strode steadily on for a couple of hours or more. The deep chords of sound gradually died down in the gathering quiet of the tired city before the first few tentative notes of the prelude to another day. He stopped at a coffee-stall, one of the exchanges for creatures of the night, hooligans, thieves, night-hawks, and gulped down a cup of coffee, evil eyes watching him, a policeman watching them. Then he set off again, covering the ground aimlessly, doggedly, swiftly; but Black Care was in better training, and walked close behind him with mocking, easy step.

Chance led him, tired but still sleepless, to the Embankment. The crackle of a few early carts punctuated the silence. The street-lamps were beginning to look tawdry before the first faint glimmer of day as he sat down on an empty seat, where the plane-trees whisper and shudder in their grave scrutiny of the homeless. Green bright torches of the gray city by day, the plane-trees of the Embankment by night—near them tragic human shapes, around them the unseen

phantom legions of the vanquished—are the Duletrees of London. Tyburn never saw grimmer sights than they see in the darkness. In their shadows range as many fanged prowlers as in the jungle; broken gentlemen, their boots agape, sleep there, clutching their last shilling; novices, wide-eyed, stonily awake; callous habitués, hands in pockets, lean shoulders hunched, snoring bundles of rags that had once been bright-eyed men and women, herded there by hunger, homelessness, drink, poverty, despair; some still watching the dying embers of hope; the majority with dull, defeated eyes; old, young, the wicked, the weak, the unlucky, the incapable, jetsam, flotsam, battered men, and the women who only smile by night beneath the gas. So near the river. Part of the System! A notable corner, one of the condemned cells of the earth; and above this human scrap-heap, through the bright open windows of a luxurious caravanserai, a cruel string band streamed the measured ecstasy of a valse.

An evil-eyed, unshaven wolf came, apparently out of nowhere, looking stealthily at the new-comer as Flett sat down, and drew closer until a night-policeman appeared, when the human beast of ravin slouched off with an uneasy grin. Then a little old man seated himself at the other end of the bench, sucking an empty pipe. He looked, and as a matter of fact was, a harmless sponger, with a garrulous tongue. The skipper looked at his battered rags and his mockery of a smoke, and listened to him good-temperedly.

It wasn't always the benches in the park with 'im. No, guv'nor! (It never is.) The old story, it was. To be honest, it was easy come, easy go. 'Ad the gen'l'man such a thing as a pipeful o' tobacco abaht 'im? No. That was a pity. Yes! 'E was saying, it was easy come, easy go. But once dahn on your luck, the world 's a rum plice. Crool 'ard for money. Crool 'ard! Toffs over there—he nodded vaguely at the City—with loads of it, an' 'ere was 'e without the price of 'is blank breakfast. Money was rotten badly divided in this world. Why should one man 'ave thousan's, an' 'im not a blank copper? Tell 'im that!

Hugh could not, but he gave him a sixpence. The creature thanked Flett, and vanished in the twinkling of an eye. The policeman ran an experienced eye over the captain and stopped opposite him.

'Mornin',' said he. 'None o' my business, in a manner o' speakin'; but if I was you I wouldn't chuck any money about here. Some o' 'em'—he jerked a thumb at the seats—'are orl right, but the most o' 'em are toughs. Toughs!'

'Thank ye,' said Flett. 'I was just thinkin' o' gettin' back to the "Baltic." How far?'

The constable gave him crisp directions, chatting with him for a hundred yards, as far as his beat took him.

'Yes,' he wound up, 'rum place the Embankment. I'm about fed-up with it sometimes. Though the most o' 'em are toughs, yer can't 'elp spottin' the real dead-beats and out-o'-works; *and* the women, my Gawd! I sometimes think there 's suthin' out o' gear in the luck, or the division o' the cash, in this world. But it ain't no good grumblin'. Well, well! Mornin'.' The good fellow turned on his beat to put in his fifty-six hours of the night per week, to earn his four shillings a day.

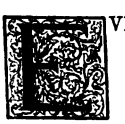
Flett strode off again, reaching the hotel thought-weary and tired in body after his long tramp on the London pavements, to fall asleep just as the sun's first arrows glanced in on the Thames in a thousand silver ricochets.

*(To be continued.)*

---

# MORE TRAMPS WHOM I HAVE MET.

By the Rev. THOMAS HANNAN, M.A.



EVEN when I go abroad I cannot get away from tramps. Of course, I am a bit of a tramp myself, and I suppose there is a kind of telepathy which brings kindred spirits together—as the German expressed our old proverb, 'Birds mit one fedder always go by demselves.' On one occasion I was taking a photograph in a quiet street of the ancient French city of Amiens, when suddenly a tramp 'materialised' in front of me. He did not seem to come from anywhere—he just got there. He waltzed round me, as the Americans express it, and he spoke French which sounded the same as Scotch when spoken under the same spirituous influences. He was so intoxicated that I have no doubt he thought I was waltzing round him; but he wanted his photograph taken. He was a tramp of the first water—if that expression may be used of a class which avoids water in any form, except rain. But he did not want money—he was too happy for that; and I was so pleased to get off that I took his photograph. But this amiability on my part caused him to glue himself to me, and I got clear of him at last by sprinting up a side street known as the Rue des Tripes. He could not weather the corner in time to pursue me.

I visited Ireland once. I was tramping along the road from Boyle to Sligo, knapsack on back, when I met a female tramp who belonged to the tinker class. She begged, and I shook my head. She passed on cheerily, with her baby on her back, and I soon saw another of the same company approaching. When the second lady got near me, the one whom I had refused turned round and called out, 'Arrah, Bridget, now, don't be proud, but take

the penny the gintleman's goin' to give ye to buy tay!' Of course, after that piece of wit I could not refuse. This incident reminded me of the story of a witty Irish beggar-woman and an old gentleman, who was hobbling along with his gouty toe wrapped in flannel and encased in a large carpet-slipper. He was not feeling amiable enough or chastened enough to throw a penny at a beggar, and he growled a refusal, to which she promptly answered, 'Throth, it's the hard-hearted ould sinner ye are indade, indade; but it's no harm I'll be afther wishin' ye at all, at all. Shure it's mesilf'll be prayin' to the holy saints to make yer ould heart as tinder as yer poor fut.'

It is very curious, when one goes in for the kind of philanthropy involved in giving employment to tramps, how seldom the kind of tramp you want turns up just when you want him. Two years ago a distressed but cultured foreigner came to me, anxious to do translation work. He would be quite useful now, as I happen to have some papers to translate; but I had none then. He was a German, and was too superior for me to think of offering him garden-work. In addition, he was surprised that his sister, who was coming over to be a governess somewhere, had not called on me to inquire about him. His one desire now was to get back to the Fatherland. So I gave him a shilling to help towards the accomplishment of that laudable object. It is quite wonderful what a shilling can do in the hands of a competent financier; but my friend did not get far on his way to Germany. In fact, that shilling only carried him half a mile; and I propound this for the reader who is fond of solving riddles: that although it was spent in less than two hours, it supported him for three days. Of course, the answer is that he was 'run in' a little farther along the road in the early afternoon for being 'drunk and disorderly'—on my shilling—and was placed next day on the horns of the dilemma expressed in the formula, 'ten and six-pence or three days.'

I think the most really pathetic case which I ever came across was that of a man who was evidently a gentleman. He called on a Saturday afternoon, and was so clearly a man of good breeding that he was shown into my drawing-room. He was a tramp, a highly experienced tramp, and probably will remain so; but his clothes, though old, were of good make, and he wore them as one who had been accustomed to good clothes. His fluency was extraordinary; and his English was that of a cultured man, with no provincial taint in it. He professed to be the grandson of a famous poet, and he called my attention to the resemblance between himself and the poet, especially in the arching of the forehead, which was remarkably high. He recounted a history which was sad, unfortunate, and, in one particular, blameworthy. I have never seen reason to doubt the main features of his story. I knew that there must, however, be a lot behind it in the way of help given to him by friends to put the broken pieces of his life together again. It happened that the only small change in my possession was twopence-halfpenny, and I felt ashamed to offer the grandson of one of the sweet singers of England the insult of such a sum. But I did; and he took it cheerfully, as if he had often been insulted that way before. Then he trudged away, trousers strapped round his ankles as if he meant to go long and far. And I meditated sadly on the faithlessness of heredity, the grief which would be felt by the poet who supported a fellow-poet's family, could he see how far his descendant had descended, and my own good fortune in having had only twopence-halfpenny in my possession. Not long afterwards I read of a man with the same appearance and the same story being sent to prison for begging in the Lake Country, so I assume that it was my unfortunate friend.

To associate with tramps is, in reality, a liberal education. They represent most of the professions. I remember seeing a cheery quartette chopping wood in a Church Army shelter in London; they were a parson, a lawyer, a schoolmaster, and an old soldier. But they had all got to the same level; they were tramps, and it is a most difficult problem to all the agencies which exist for the elevation of the downfallen to get them to be anything else.

The profession which uses the definite article as the Highland chief uses it with his name is often represented—namely, the theatrical profession. Its members are probably the most sympathetic people in the world, and the great ones of the profession are most liberal in helping their less fortunate brethren. But sometimes they get tired, and then the 'chronic' starts out for the parson. One of these got me very badly once. He arrived on a Sunday evening as I was about to start for church. The rain was pouring—a fact which ought to have suggested caution to me. He was extremely gentlemanly—quite as much so as the grandson of the poet. He furnished me with both his theatrical and his real name. The latter was a family name which would command respect anywhere. He was carefully dressed, and had come to me after an unsuccessful effort to obtain an engagement at the local theatre, which is a very 'one-horse' affair. He illustrated Shakespeare's words that 'one man in his time plays many parts.' He told me that he had attained the highest ambition of every actor, and had played the character of Hamlet. But he fell in my esteem when he told me that he had also, at a later period, taken the part of the Ghost in the same play. Apparently there was a sort of slump in dramatic talent at this time, for he had been reduced to the humble level of delivering shop-bills announcing the details of a kinematograph show in Edinburgh. His visit to me was prompted by the desire to obtain comforts for his wife, who had just broken her leg. On this occasion I happened to have half-a-crown in my pocket,

and I parted company with it, which worried me during the whole service.

But this incident had a sequel. In a few days a lady called. She was an actress, and had very coquettish manners. She had her head swathed in bandages, and she informed me that she was the wife of Hamlet, whom I knew '*so* well.' It appeared that it was not her leg but her head which was broken, as the result of an attack of giddiness, which had caused her to fall downstairs. Ah, those horrid attacks of giddiness! They are the cause of most of the failure and poverty and misery and crime in this civilised country of ours! I was so annoyed at her husband's anatomical ignorance that I forgot to be gallant, and turned the lady out at once. I learned afterwards that Hamlet had made a good thing out of a series of well-timed visits, and had then reverted to his successful representation of the Ghost.

The glamour which surrounds the stage in the eyes of young people would soon disappear if they could penetrate the mysteries of 'doing the smalls,' and see the faces of the company when 'treasury-day' has arrived and the manager has departed. 'Treasury-day' is pay-day, usually Friday; and 'doing the smalls' is touring the small towns, in most cases only stopping one night in each place. Business is very often bad, and when Friday comes the manager sometimes suffers from total loss of memory and cannot be found. Then the unfortunate players become veritable tramps, and I have on various occasions had to help quite nice people in this difficulty.

A tramp once told me the truth, and it gave me such a surprise that I completely lost control of myself and encouraged him in his evil ways. He was an old soldier, a jolly fellow who had left the army with the rank of colour-sergeant. He was a handsome man, with a laughing face, curling hair, a fine moustache (well turned and curling upward), and a fine soldierly air. He gave me a magnificent salute, and I demanded to see his papers. They were all in order, and showed that he had a good pension. Instead of asking him how he came to be on the road, I said, 'Suppose I give you a shilling, what will you do with it?' His answer came like a crack, 'Oh, probably drink it!' I gave him a shilling at once, forgot that I had a garden, let him go without a lecture, and retired to my study in a dazed kind of way. Talk about truth being at the bottom of a well! When it gets up and hits you in the face like that, you do not know where you are.

When you help a tramp, he always believes that he deserves it. At least, if he does not, he is very good at pretending. Only a few days ago a tramp who was charged at Workington with being a vagrant indignantly protested that he was a respectable working-man. He was asked what he did for a living, and replied stoutly, 'I walk for a living.' That is the pride of the free-born Briton! I have found myself up against it more than once, but particularly on a certain occasion when I was working in my front garden. An alleged ship's engineer came sauntering up to me. He had called the previous year, and was taking the journey again. His garments were oily, and he wore the usual peaked cap of the sailor. I knew him, but he did not recognise me. 'Is the master in?' he inquired familiarly of me. Knowing that he was a humbug, I answered gruffly, 'What do you want?' With great dignity he responded, 'That is no business of yours; tell your master I want to see him.' That was simply 'asking for it,' and I 'riz' on him. Then he recognised me, and his disappearance was rapid. I am sure he has put me off his visiting-list.

If you want to keep tramps off the premises you must keep a tame one on them. A tramp is about as difficult to tame as a golden eagle; but when once tamed, he keeps other tramps off better than a bulldog. I possess one now. Other tramps come along, see him working like a nigger in the garden, and shy off as if they had been bitten. It is not fear of work, but simple, downright loyalty; they will not poach upon another man's preserve—when the other man is a brother-traveller. I first caught mine three years ago, and taught him the elements of gardening. Then he disappeared and toured in England. From the time which elapsed, I have a suspicion that he was searching for the North Pole. He has been working steadily with me, when the garden requires him, since last April, and has now formed a working connection in the neighbourhood. He arrives punctually, works hard and steadily, and can be relied upon to do the work allotted to him as thoroughly when left alone as when under my watchful eye. And he has always been thoroughly sober. He seems to have largely forgotten that he was once a wild man of the wide, wide world; for, in discussing certain aspects of gardening work the other day, he informed me that he had been brought up to it, although I know that I taught him. It is a pleasant sight to see that a man has acquired a feeling of having a place in the economy of industry. How good it would be if our army of tramps could be made to do profitable work, and to set themselves to the task of restoring 'the years that the locust hath eaten'!

# THE SOLITARY GUEST.

## CHAPTER III.

CAPTAIN COMPTON passed through the heavy iron gates of Grangemuir and up the drive. As he walked he stopped now and then to look around him. It would have been difficult to find a more beautiful and peaceful scene. The afternoon sun shone through the great beeches and firs, and made long shadows on the bracken and grass. A few rabbits ran hither and thither, and an occasional squirrel scuttled up a tree. As he approached the house there was the gleam of flower-beds under the windows, and he heard the happy laughter of children playing under the trees.

When he rang the bell and asked for Sir Leslie Howard, the butler looked a little askance at the somewhat shabby-looking individual before him; but when Captain Compton produced his card with name and regiment he relented, and said that he would make inquiries. Captain Compton was shown into a comfortable, spacious library, where a fine-looking old man rose to receive him.

'How do you do, sir?' said Captain Compton. 'It is long since I have seen any of your family, and you probably do not know my name; but I was interested in seeing your daughter-in-law drive past this afternoon, for I very well remember being the solitary guest at her wedding in Yokohama.'

'Oh, indeed?' exclaimed Sir Leslie. 'How very interesting! I have often heard my son's wife speak of her lonely wedding in Japan, and I recollect that she has always said that there was one guest.'

Captain Compton proceeded to relate the circumstances of how he had been invited by Miss Moreton to her wedding, and then, after a little desultory conversation, he pulled a newspaper cutting out of his pocket.

'I am afraid that what I am about to say will be very disagreeable to you, Sir Leslie,' he said; 'but you will have to face the matter sooner or later. In fact, if it had not been for your son's absence in South Africa you would probably already have heard of this unfortunate business.'

'Unfortunate business!' broke in Sir Leslie. 'What are you talking about?'

'I think you will understand it best if you read this,' said Captain Compton, handing him the newspaper cutting.

Sir Leslie proceeded to fix a pair of glasses on his nose, and then took the paper from Captain Compton's hand. He read it over more than once, and then, looking up, he said sharply, 'What has this to do with me?'

'Ah,' said Captain Compton, 'I see that you do not realise the full bearing of this statement. Allow me to explain a little. It was understood in Yokohama that a certain church was licensed for marriages, and that no ceremony was needed at the Consulate. But a clause in the treaty revision deprived the church of this license. The matter was not understood at the time, and marriages continued to be performed under the impression that they constituted fully legal ceremonies. As a matter of fact, they were not; and parties who were married in church ought to have proceeded afterwards to the Consulate for the legal ceremony after the religious ceremony.

'Now, Sir Leslie, as I happened to be present at your son's marriage I know for certain that he did not have a consular ceremony. On what day does your daughter-in-law celebrate her wedding-day? The 1st of June? Just so, the day on which Mr George Moreton and I saw her drive off after the church ceremony. I recollect that Miss Moreton particularly disliked the idea of going before a consul. Do you now realise the importance of what I have told you? I can see by your face that it is quite new to you.'

Sir Leslie rose from his seat and walked up and down the room. 'New to me!' he said with a groan. 'Good heavens, I never heard such an awful thing! But no, it is impossible. Do you mean to tell me, sir'—and he turned in a fury upon Captain Compton—'do you mean to tell me that my son's marriage was not properly legal?'

'Really,' laughed Captain Compton, 'one would think, Sir Leslie, that your son's marriage was not correct through some fault of mine, whereas I am only the bearer of an unwelcome piece of news.'

'I apologise,' said Sir Leslie, sitting down with a groan; 'but such a piece of news as this is enough to make a man forget himself. I don't yet realise what it means.'

'I can tell you exactly what it means,' said Captain Compton; 'for before coming to bring the unfortunate fact to your notice I wished to be quite sure of its bearing, so I asked a lawyer what were the exact changes that it would make in your family circumstances. According to a lawyer—a lawyer, remember, who is not likely to make any mistake—your son's marriage cannot count as a legal ceremony, and in that case these charming children'—here Captain Compton pointed out of the window to a little group under the trees—'these children, I regret to say, are illegitimate.'

Sir Leslie started from his chair. 'No, no,' he exclaimed, 'that is impossible!'

'Pardon me, my dear sir,' said Captain Compton. 'Once it is proved that the marriage is null and void the children must be illegitimate; there can be no question as to that. And I fear that as the matter stands at present the next heir to your property, in the event of anything happening to your son, is not that charming little fellow I see playing in the park, but your cousin, Captain Montague Howard, who, I imagine, is not a favourite relative of yours.'

Sir Leslie's face darkened at the mention of his cousin's name. 'He is forbidden this house,' he muttered.

'Quite so,' said Captain Compton. 'His reputation is such that I am sure no one would wish a beautiful property like this to pass into his hands, for it would not remain there long; it would be in the hands of the Jews. But in the meantime we need not contemplate any such melancholy event. Your son is a strong man, and in no danger. When he comes home, which I understand will be in about two months, the matter can be put in the hands of the lawyers, and redress will soon be obtained. However, the position is distinctly a painful one for your daughter-in-law. She is now passing for Mrs Leslie Howard when she is legally only Miss Sibyl Moreton.'

'Surely,' said Sir Leslie anxiously, 'there is no need for my daughter to know till my son comes home? Does any one know of the matter but yourself?'

'I believe not,' said Captain Compton. 'Her brother, George Moreton, who was the only other person present at the wedding, is, as you know, in New Zealand, and it is quite likely that he will not see this statement. No, as far as I know, Sir Leslie, there is absolutely no one that is acquainted with the particulars of your son's marriage but myself.'

'And you?' said Sir Leslie earnestly. 'I am sure we can trust you, my dear sir, not to let this matter be known.'

'Ah,' said Captain Compton with a smile, 'that is a matter for considerable thought. Here am I, a poor man. I make no secret of the fact that I have nothing beyond my small pension to live upon, and I find it very difficult to make ends meet. There comes into my possession a secret of some importance. I can go to-morrow to one of the daily papers with this very fresh little bit of news: a well-known family in trouble; the heir's eldest son found to be illegitimate; a charming society lady has no legal right to her married name. News is scarce just now, Sir Leslie. If I go up to town to-morrow it might appear with headlines in *The Daily* on Monday. What a sensation it would cause in your village!'

Sir Leslie rose to his feet with a look of perfect horror on his face. 'You are a fiend!' he exclaimed. 'I believe you are delighted at this misfortune.'

'No more of a fiend than other men,' said Captain Compton imperturbably. 'No poor man lets a chance of making money pass unless he is a fool. But let us consider the matter calmly. All I want is some money; all you want is to keep the matter private till your son returns. Surely the arrangement is quite clear. You pay me the money, and I will give a written statement that I will not mention the matter to a soul. Let us say fifty pounds.'

Sir Leslie groaned. 'Can I trust you?' he said. 'If I give you fifty pounds, what proof have I that you won't go next day to the newspaper you speak of?'

'I give you my word of honour, Sir Leslie, that no such thing will happen. I will give you a written statement by which you can show me up as a scoundrel if I break my word. Think the matter over, Sir Leslie. The inn in the village is a delightful change from my London lodgings, and I shall spend the night there. If I receive a note from you with your cheque this evening I will send you my written promise; if not, I will consider myself free to make any use I like of my information.' So saying, Captain Compton left the room.

*(To be continued.)*

## LIFE.

God give me grace to use my hands,
In willing service day or night,
For any of life's great demands,
To soothe, to labour, or to fight;
Not counting cost of fruitless toil
Or strained to grasp unworthy meed.
Marked they may be by sodden soil,
Bruised they may be by honest need.

God give me grace to use my eyes
To watch life's issues day by day,
And see the glory of wide skies,
Azure or clouded, fair or gray.
To read the soul behind the face,
The smile disguised by fear or frown;
And if tears blind them for a space
Let me be brave to weep unknown.

God give me grace to use my heart,
Full-filled with love and strong to live,
Fearless in home or field or mart,
And with good measure glad to give.
So drink the lees of every sweet,
So hold my faith and run my race,
To sigh, content, at its last beat,
'I've worked, seen, lived by God's good grace.'

# JOHN BASKERVILLE, PRINTER.

By R. A. Gatty.

LOVERS of books and collectors of rare editions are delighted when they can meet with a 'Baskerville' classic, or any work from the press of that notable printer. It is not every one, however, who knows the curious history of this celebrated man, or his subsequent fate, which was not only extraordinary but gruesome.

John Baskerville was born at a place called Wolverley, in Gloucestershire, in the year 1706. There is no record of his having attached himself to any particular line of business, but we hear of him in 1721 keeping a writing-school at Birmingham. He also was occasionally engaged in cutting inscriptions on gravestones. In the year 1745 he had taken to a japanning business; and this was a very profitable concern, and he became a rich man. His tastes were always inclined to literature; and now that his means allowed him to indulge them, he began to try his hand at improving printing. He turned his attention to typefounding, and so successful was he that even at this day his types may be considered models. By his unceasing efforts he brought printing to a degree of perfection previously unknown in this country.

In a letter from him to Horace Walpole, dated November 2, 1762, he says he is manufacturing his own ink, presses, chases, moulds for casting, and all the apparatus for printing. There is another interesting letter bearing the date of July 15, 1760, from a Mr Derrick to the Earl of Cork, containing a description of Birmingham and the work of John Baskerville. He says: 'I need not remind your lordship that Baskerville, one of the best printers in the world, was born in this town [this was a mistake], and resides near it. His house stands at about half a mile's distance on an eminence that commands a fine prospect. I paid him a visit, and was received with great politeness, though an entire stranger. His apartments are elegant, his staircase in particular curious, and the room in which he dines, and calls a smoking-room, is very handsome. The grate and furniture belonging to it are, I think, of bright wrought-iron, and cost him a round sum. He has just completed an elegant octavo Common Prayer-Book, has a scheme for publishing a grand folio edition of the Bible, and will soon finish a beautiful collection of fables by the ingenious Mr Dodsley. He manufactures his own paper, types, and ink, and they are remarkably good. This ingenious artist carries on a great trade in the japan way, in which he showed me several useful articles, such as candlesticks, stands, salvers, waiters, bread-baskets, tea-boards, &c., elegantly designed and highly finished. Baskerville is a great cherisher of genius, which, wherever he finds it, he loses no opportunity of cultivating. One of his workmen has manifested fine talents for fruit-painting in several pieces which he showed me.'

It appears, however, that Baskerville's printing business was not really profitable. He was not supported by the book trade, and, like many men who introduce innovations, he had to wait for his success. The University of Cambridge granted him leave to print the Bible in folio and two editions of the Book of Common Prayer; but at the same time the University claimed a share of his profits to the extent of twenty pounds per thousand copies of the Bible, and twelve pounds ten shillings for each thousand of the Prayer-Book. Again, the Stationers' Company demanded thirty-two pounds for their consent to print the Psalms, without which the Prayer-Book would not have been complete.

From a passage in a letter to Horace Walpole it would appear that in 1762 he was desirous of withdrawing from the business, for we find him writing: 'This business of printing, which I am heartily tired of, and repent I ever attempted.' After 1765 little or nothing issued from his press. His most notable editions are Horace, Terence, Catullus, Lucretius, Juvenal, Sallust, and Florus in quarto-royal, Virgil in octavo, and also some of our English classics. The japanning business continued to thrive, and no doubt made some compensation for the loss in book-printing. Baskerville's heart and tastes were bound up in the latter, and apparently he

[*All Rights Reserved.*]

grudged no expense to bring out his works in the greatest perfection. It was a noble effort even if it terminated in a loss, and it has won him a fame in the book-world which he loved that he never dreamed to attain.

He was a good son to his parents, who were in poor circumstances; and he supported them to the day of their death, and they attained a good old age. He married the widow of a Mr Eaves, but had no children. Like many men of genius, he was rather eccentric, and one of his whims was to have the panels of his carriage painted to represent one of his trades. Although he became famous for his production of the Bible in folio and the Book of Common Prayer, he was not himself a Christian but a positive unbeliever. It was this, perhaps, which led him to put in his will a direction that he was to be buried in his own garden.

It happened that in his grounds were the remains of what had been at one time the base of an old windmill. He added to this structure and converted it into a kind of conical monument, with an urn at the top. He died January 8, 1775, and by his directions his body was placed in an upright position under this remarkable mausoleum. After his death his widow carried on the japanning business; and nothing more would have been heard of Baskerville, in all probability, had not the Birmingham rioters in 1791 destroyed his tomb. His body, however, was not desecrated; and it remained there until 1820, when the growth of the town and rearranging of streets led to Baskerville's garden being rooted up. It was then that some labourers came across a leaden coffin.

It is difficult at this point to trace exactly what happened; but it is on record that when the coffin was opened at that time, it was found that the body within did not present the usual features of decomposition. It had, for some reason or other, become practically a mummy. In those times, we may presume, there was not that strict investigation such as would be made at the present day; for there is pretty good evidence that the mummified body passed into the hands of a glazier, who dressed it up in Court clothes and showed it in a room at the price of one penny to all who cared to look. No doubt it was a source of income to the glazier, and the authorities apparently did not interfere.

The widow must have been long since dead, and there were no relatives to come forward and claim the corpse. How long this exhibition lasted it is impossible to say; but as so many people had seen the ghastly show at the glazier's, the fact was well known in Birmingham, and has been handed down from generation to generation. Then follows a long period of oblivion as to Baskerville's fate, and nobody knew what had become of him—whether he had been eventually buried, or was still put aside as an anatomical specimen. Probably the mystery would never have been solved until the end of time but for quite an accidental circumstance. Under the Birmingham Churches Act, leave was given to pull down Christ Church; and under this building were some vaults—or, rather, niches—five hundred or more, all labelled with the names of those laid within them. There was one which had no name, and as all the bodies were to be removed and reburied, it was thought necessary by the authorities to make an inspection of this vault. It was accordingly opened, and within it was found a lead coffin, with the words 'John Baskerville,' in large-sized printer's types, soldered on to the lead.

There had been so much uncertainty about the final resting-place of poor Baskerville that, to set everybody's mind at rest, the authorities ordered the coffin to be opened. Little more than a skeleton was found inside; but the entire body was there, and the remains of a shroud could be seen round it. An examination was made of the head, and curiously this betrayed the evidence that the body had been in a glazier's hands. In order, no doubt, to fix the jaws, putty had been inserted, and by the side of the head lay a glazier's putty-knife. The coffin was removed with the others to a final resting-place.

One hundred and twenty or more years had elapsed since the great printer's death, and but for the unhappy directions of his will the terrible fate which befell his body after death would have been averted. It would seem that the leaden coffin in which he was found was the original one in which he was buried under the mausoleum, as his own types were soldered on the lid. The glazier, therefore, must have preserved this with a view of eventually burying him when the disgraceful show terminated. In soldering the types, the letter 'J' had been put upside-down; but this may have fallen off and been replaced carelessly, for it is unlikely that his own workmen would make such a mistake.

Baskerville's house and garden have long since disappeared, and streets and houses cover the ground; but it is curious that printing-works exist on the old site at the present day. The work of Baskerville will be better appreciated when it is remembered that, from the time of Caxton up to 1720, the types used in England were mostly imported from Holland. In that year a man named William Caslon, originally an engraver of ornamental devices, turned his attention to letter-cutting, and soon obtained such a reputation for his work that he not only stopped the importation of foreign types into England, but his own were frequently sent into Continental countries. The foundry established by Caslon in London has continued up to the present day, and is represented by the flourishing firm of Messrs H. W. Caslon & Co. Next to the name of Caslon, that of Baskerville must be placed in the history of the art in England.

# LAURISTONS.

## CHAPTER XI.—HOW THE MARQUIS GOT WHAT HE WANTED.

TWO matters only concern us greatly in connection with Sir George's dinner-party.

It was in the great drawing-room, after dinner, that Mr Pitt, who had come in late from the House, with the weight of many cares on his shoulders and plainly visible in his face, first mooted the idea of a national subscription for the defence of the country and the carrying on of the war.

Bonaparte was carrying all before him on the Continent, and fulminating direst threats against unbendable Britain; the country was groaning under its burdens and crying aloud to the King to get rid of his Ministers and make peace—reasons enough for a serious face, without a doubt.

Mr Pitt was talking with his host, surrounded by a circle of financial magnates, including the Governor of the Bank of England, which, in consequence of the unparalleled demands upon its funds by the Government for war purposes, had been compelled to suspend cash payments but a month or two before. There, also, was the Lord Mayor, who had been forced by his liverymen in the City to present a petition to the King begging him to get rid of Mr Pitt. And there, keenly interested in it all, was John Sax.

'Money we must have,' said the Minister gravely, 'or England may go the way of Austria and Italy. No sacrifices then will atone for lack of them now. The sacrifices would be infinitely greater, but they would be too late to be of service. It is easier to keep up than to get up if once we are thrown. What would be your idea, Sir George, of a national subscription? Would the City and the country respond?' And the grave, keen eyes rested with searching inquiry on the banker's face.

'I can answer for one, Mr Chancellor,' said Sir George heartily. 'Lauristons will consider it an honour to head the list with ten thousand pounds. I think you may count on others not being backward. General Bonaparte on British soil would be the worst investment Britain ever made.'

'I will never forget this,' said Mr Pitt, moved out of himself, and he gripped his old friend's hand impulsively.

On the outer circumference of that weighty circle old John Sax had been revolving like a comet of broken orbits, in order to see and hear all he could; and when he heard his chief's words his mouth tightened momentarily as though his economic spirit protested at such munificence of patriotism. But before Mr Pitt left the room that night he was assured of the success of his suggestion, and that the City would rise to the occasion.

And the other matter of moment that night!

'I have known great affairs carried through, even in such places, M. le Marquis,' John Sax had said but an hour or two before; and M. le Marquis had chuckled and cast a quick glance at him, in search of personal application in the remark, and had found none.

All the evening M. le Marquis had been enjoying to the full this return to his natural state in life; though, *parbleu!* this assembly was not within measurable distance of what he had been accustomed to at Versailles. Still, it was an approach thereto, and decidedly a pleasant break in the monotony of life in Queen Street.

It was after dinner, when the buzz of talk in the great drawing-room was at its height, that chance—which in skilful hands is but a deft control of circumstance—brought him alongside his hostess.

She was chatting with Lady Mary Howe, who had been dilating on the delights and terrors of the Royal wedding—the heat, the crush, the faintings, the lovely music, the dresses—when M. le Marquis joined them, with a gallant, 'Ah, mademoiselle, and who is to be the next? For one such wedding always preludes more. Is it not so?'

'Let us hope so, at all events, M. le Marquis. But who will be first it is hard to say,' laughed Lady Mary.

'Ah, ha! All the same, little birds whisper in the trees, and the passing breeze picks up the pretty whisper and carries it along. And why wait? Time flies, and we shall none of us ever be as young again as we are to-day.'

'That is true,' said Lady Mary, with a pretty blush and a quick *riposte*. 'But we—we—M. le Marquis? Am I to congratulate you also, then? Ah, pardon! There is my mother wanting me. All luck to you, monsieur!' and with a laughing nod she was gone, and for a moment Miss Lauriston and the marquis were alone.

There was a great inquiry in his eyes as he looked at her.

'Mademoiselle has done me the honour to consider the proposal made in my letter?' he asked quietly.

'I have, M. le Marquis;' and her face was as Lady Mary's a moment before.

'And'——

'*Soit!*' she said softly, and M. le Marquis gently squeezed the hand that hung by her side.

'I will call upon Sir George to-morrow,' he whispered.

'Very well. But, remember, I am my own mistress.'

'You think he will object, then?'

'One never knows,' said Aunt Charlotte, with a shrug that would have graced even the shoulders of a Marquise de Montessonne.

### CHAPTER XII.—HOW AUNT CHARLOTTE LOOKED TO THE FUTURE.

'WELL, well!' said Sir George, with his eyes fixed musingly on Aunt Charlotte's face. 'If you have quite made up your mind'——

'I have quite made up my mind, sir.'

It was the evening after the dinner—a Saturday—and they were sitting in Sir George's small room where he sat and smoked and thought things out. Captain Lauriston had ridden over to Ealing, to spend the Sunday there with his wife and the children.

'It will be a great change for you. What may happen over there it is impossible to say. But there are one or two things I would suggest—nay, I would most strongly urge upon you—in your own interest. We may take it that one of the attractions to M. de Montessonne in the matter is your money. You are wealthy. Your money should be settled on yourself.'

Aunt Charlotte nodded. She had thought of that herself.

'And if you will take my advice, you will keep the control of it in your own hands. It means power. You may need it to hold your own if you should ever return to France.'

Aunt Charlotte nodded again. The common-sense of that appealed to her.

'And, in the last place, I would beg of you to see to it that none of it follows the remnant of M. de Montessonne's own fortune in futile efforts to rehabilitate the Bourbons—unless, and until, France shows plainly that she wants them. Madame de Montessonne with one hundred and eighty thousand pounds absolutely under her own control may become a personage—either here or in Paris. Madame with nothing but a pocketful of Bourbon promises, and her husband teaching French, would be a very different person indeed. You understand?'

'I quite understand, sir, and I quite agree. Perhaps you will arrange all that for me. It would hardly be seemly in me to discuss such matters with the marquis.'

'Will you leave it to me to make matters as safe for you as I can?'

'If you will be so good, sir.'

'Then I will put the whole matter into Pennefeather's hands, and he will see to it all for you.'

'I thank you, sir. Is there anything else?'

'Nothing, I think. You will be getting married at once, I presume. M. le Marquis, at all events, will not wish to dally over the matter.'

'Nothing is fixed, of course; but, as you say, there is no reason for waiting.'

'And afterwards? You will take a house, I suppose?'

'We will settle all that now that everything else is arranged. We shall want a house, of course, until'——

'That may be a very long time of coming,' said Sir George, with a dubious shake of the head. 'I doubt if some of us will live to see it.'

'M. de Montessonne seems hopeful.'

'Hope is long of dying. When a man gives up hope it is time for him to go.'

---

### CHAPTER XIII.—HOW THEY MADE HOLIDAY WHEN ALL THE WORLD WAS YOUNG.

H the rapturous delight of those rare days when, as now, Captain Lauriston came cantering up the drive, and caught first a flash of the eager child-faces at the window as they sprang up to look, and then their cannon-ball exit from the front door as they captured him and dragged him, a laughing prisoner, to the waiting mother upstairs!

And how her eyes shone and her face kindled at the sight of him! Captain Charles found her sweeter and fairer each time he came, and the sight of her great joy in him more than compensated for the career he had given up. For it had been no light matter to snap all his hopes at a moment's notice, and to check the tide of his military fortunes just as it was rising to the flood. He was a born soldier, and had looked to die one. It was only sternest necessity, and a high sense of duty, and a will that knew no turning when sense of duty had once fixed it, that tamed his spirit to the banking stool. But there, beyond all question, his duty lay. For his father, though wonderfully hale and vigorous, was getting on in years—had even shown signs of the weight of them at times, Captain Charles thought; and the welfare of the bank required that a Lauriston should be ready to take the helm whenever necessity called.

For these five years he had worked manfully at his new calling, fitting himself for the headship by patient and careful mastery of all that lay behind. He had, of course, all the advantages of guidance and instruction that could be afforded him, so to compass in as short a time as possible the knowledge that another might spend half a lifetime in acquiring. And these five strenuous years had taught him almost all that even John Sax knew of banking matters—without, however, the hard practical experience which only the years could bring. Ay, he knew almost all that even John Sax knew of banking matters—almost all, almost all, but not quite!

Sir George still held the reins firmly in his own hands, and John Sax held the slack ends. There were inner mysteries of high finance to which Captain Charles had not yet penetrated; but if he, as a unit, was a born soldier, the Lauristons as a race were born bankers, and he was no whit behind the rule in his assimilation of knowledge and grasp of commercial principles. He was universally liked for his genial bearing and quiet courtesy, and the wide and influential clientèle of the bank—West End drones and City bees alike—were satisfied that

Lauristons was in safe hands in spite of Sir George's years.

When the opportunity of release from matters financial offered, Captain Charles welcomed it as a schoolboy an unexpected holiday, and he behaved as such. His horse would be waiting for him the moment his last stroke of work was done, and every beat of its hoofs struck something off his years and as much off his mind. And so by the time he reached the Red House on Castle Bear Hill he was young enough to cope with the wildest demands of the annihilators of Redskins, and just the right age to set the love-sparks glowing in Mrs Charles's eyes and to fill her face with the radiant joy of his presence. Then it was holiday-time for them all, and every moment of his stay must yield its precious honey.

When the weather and Mrs Lauriston's health would permit, they drove far and wide over the country-side—to the Royal Gardens at Kew; to the Royal Park at Richmond, with dinner at the quaint old 'Star and Garter,' and an exploration by boat of the winding reaches of the river; to Windsor and a possible sight of the King and Queen and the Princesses on the terrace, and even a possible graciously exalting word from them.

On days when their mother found more enjoyment in the thought of their pleasure than in active participation in it, they roamed afoot, laughing, chattering, leaping ditches, scrambling through hedges, eating at any wayside inn that took their fancy; lying for rest in hillside nooks, or in some glad new discovery of woodland dell, carpeted with bracken and pine-needles and acorns, and roofed with shimmering green, where tricksy, bright-eyed original inhabitants played at hide-and-seek with them among the branches. And, but for the lack of the sweet-faced, radiant-eyed mother, these were the days they enjoyed the most.

Over the dinner-table that day Captain Charles gave them very full and particular information about the great doings in Grosvenor Place the night before; described the ladies' dresses to the best of his powers for Mrs Lauriston's and Mavie's benefit, and got drowned in bursts of merry laughter at times by reason of his obvious mistakes; told them some of the stories he had heard about the royal wedding; and discoursed lightly on some of the best-known people who had been there.

'M. de Montessonne was there,' he said, with a nod to Etienne, 'to touch our English manners to the standard of Versailles. And John Sax of course'—at which little Jack's honest face flushed with ingenuous pride, and still more when Captain Charles added, 'Whatever should we do without John Sax?'

Then he must hear all they had been doing since he saw them, and Etienne's hair began to feel creepy-crawly about the back of his neck when Charles launched instantly into a voluble description of their meeting with the soldiers by the little church.

But Captain Charles quite understood how impossible it would have been for them not to follow so vast an attraction, and he was greatly interested in all they had to tell about his old regiment. He simply reminded them of the need for caution and the observance of the bounds that direful experience had set for them, and left the matter to their goodwill and common-sense.

'And what shall it be to-day now?' he asked, as exuberantly as a schoolboy planning the brief scheme of his holiday. 'The Princesses are at Windsor. Shall we go and peep at them through the railings? Or shall we drive to Richmond and take the river there? Or what would you like best, my dear?'

'The thought of your enjoyment will be quite enough for me to-day,' said Mrs Lauriston gently.

'Oh mother!' from Mavie and Charles.

'Really, Mary?' with a look of concern from Captain Charles.

'Yes, dear. I am sorry; but journeying of any kind to-day would be no pleasure to me, but the reverse. Why not do the walk to Harrow and Stanmore you have been talking so much about? You have none of you been this year yet, and Etienne here has never been at all, and the country is just at its best.'

Captain Charles looked doubtful, but she knew his thought, and said quickly, 'Do take them, Charles. I know they are all aching for that walk. It will do me more good than anything to think of you all enjoying yourselves, and you shall tell me all about it when you get back;' and she smiled on them as sweetly as though pain and weariness were absolute strangers to her.

And so, since he knew her so well, and what would please her best, Captain Charles gave the word, and presently they were streaming away through the sloping meadows to the Brent.

Just a glance into the frontier fort and an excited explanation of the advantages of the tunnels through the thicket, and they crossed the stream by the plank.

And the plank, of course, recalled the fox and the hounds, and Mavie's irrepressible tongue was in the middle of the incident almost before she knew it.

'It's a good thing none of you got bitten,' said Captain Charles off-handedly.

'Oh, but I did!' chirped Mavie.

'You got bitten! Where, child? A dog's bite is not a thing to trifle with,' he said with concern.

'She's all right,' said Charles weightily.

'Yes, really, it's nearly quite all right now, daddie. It's got back almost to its proper shape and colour, and we didn't tell mother, lest it should worry her.'

'Let me see it;' and Mavie began to turn up her sleeve, chattering all the while.

'It was only a teeny, tiny hole the dog made, and he didn't mean to,' as Captain Charles examined the arm and felt it carefully. 'And it doesn't hurt

the least little bit. It was John Sax sucked it all out of shape, and made it look like a plum, and three times as bad as it really was, and then Hepsy put some stuff on and tied it up.'

'That was very clever of John Sax, and we are very much indebted to him;' and the kindly pats he bestowed on little Jack's shoulder covered that young man with confusion and made his face warm again.

'And I won't go mad, will I, father?'

'Not a bit madder than you are now, I hope, Mav. I don't think we could stand it. Who's been making game of you, child?'

'Charlie brought a great big mug of water to me before I was out of bed this morning, and stood watching me like a—like a baslik—till I'd drunk it all up.'

'She didn't kick a bit, so that shows she's not going mad,' said Charles complacently. 'You see, I'd been thinking of it all night, 'cept when I was asleep; and it was horrid to think of, and I wanted to make sure.'

'Well, I wouldn't think any more about it, either of you, if I were you. It'll be all right in a day or two, and I'm glad it's no worse. I've had heaps of bites, and I'm not mad yet,' said Captain Charles.

'There! I told you so, Mav, and you needn't have cried,' said Charles triumphantly.

'It was being wakened up all of a sudden, and made to drink all that cold water, and your great big, horrid, staring eyes. I declare I'm all cold and swimmy inside yet. And you're a nasty, horrid thing, Charles Lauriston, so there!'

'Just think of all the changes this little church has seen,' said Captain Charles, by way of diversion, as they passed under the shadow of the little Norman tower. 'Who was King of England in the year 1200, John Sax?'

And little Jack drew his wits together with a start at so searching a question, and sent them off hurriedly in quest of the answer. 'Would it be John?' he asked doubtfully. 'There were such a lot of them just about then, sir.'

'Yes, they were lively times those in some respects, and deadly dull in others. Some young knight may have kept his vigil in this tiny place, and mail-clad Crusaders may have knelt here before setting out for Palestine. If old walls could speak what tales they might tell!'

'Old houses would be horrid!' said Mavie with decision. 'The only way to do would be to pull them down as soon as any one died in them.'

'Then the stones would be used for other houses, and they'd all be telling bits of tales without beginnings or endings, and that would be worse,' said Charles. 'The only way would be to burn 'em all up and build with new stones every time.—Has there ever been any fighting round here, father?'

'Over at Brentford there was some hot work between Prince Rupert and the Roundheads.'

'Which won?'

'Rupert won, and cleaned the town of its last crust. Ealing was cleaned out too.'

'Which side would you have been on, father, if you'd been there?' asked Mavie anxiously.

'Ah, now, I wonder! Which side would you have been, Mavie?'

'Oh, a Cavalier, of course. They looked so splendid, with their big hats and curls.'

'I'd have been with Prince Rupert. He was a dasher!' said Charlie.

'And you, John Sax? Etienne would have been for the King, of course.'

'The Montessonnes have always stood by their King, monsieur.'

'John Sax would have been a Roundhead, and worn a tin pot on his head,' scoffed Mavie.

'I think I would have been a Roundhead,' said John Sax, with a warm face again. 'And an iron cap was more use in a fight than feathers and curls. Besides'——

'Roundhead! Roundhead!' chirped Mavie, dancing in front of him.

'Besides what, John?' asked Captain Charles, with a friendly hand on his shoulder.

'Well, I'm always sorry for the King, and his head having to be chopped off, but he was in the wrong, you know.'

'Roundhead! Roundhead!' and Mavie danced scornfully about him.

'Never mind her, John. She's a minx,' said her father, laughing at her excitement. 'Always stick up for your principles, my boy, and don't be led astray by curls and feathers.'

They scrambled over hedges and ditches into the dark little wood, because, as Mavie said, woods were 'so 'maginative,' then crossed the new canal and climbed Horsington Hill, because—according to mademoiselle once more—'hills always make you feel wider and bigger,' and so through Sudbury End to Harrow, talking, talking all the way, and unconsciously revealing themselves to the watchful eye which seemed given wholly to laughter and enjoyment.

Charles and Mavie, indeed, did most of the talking, for to them the presence of Captain Charles was a rare delight, and their spirits were out of bounds with their bodies. Etienne was always inclined to reserve in the presence of the powers that be—one of the results of his training; and John Sax's modesty ever set him more towards thought than speech.

*(To be continued.)*

# TRADE TRICKERIES.

By Algernon Warren.

'IF an angel were to come down and offer him drugs from elsewhere he would say, "I get all mine from London."' Such was the rejoinder of a commercial traveller for a much-respected provincial firm of wholesale druggists, when asked how it was that he could never succeed in securing a drug-order from a certain pharmacist. Keen competition nowadays has modified the old conservative tendency towards restricting purchases to one locality under all circumstances; but to this day numbers of merchants and traders are prepared to 'pay for trust' where drugs and chemicals for medicaments are concerned. They will take no chances. Another firm's goods may be all right; but the house that they have dealt with for years has their confidence, and they will not risk peace of mind by changing, their mental attitude being that the possible saving of a few shillings in a purchase from a new source may be more than counterbalanced should there be the slightest inferiority connected with it which might possibly affect their reputation for supplying the best of everything only.

The standard of purity of drugs and chemicals as supplied both by metropolitan and provincial British wholesale firms to retail pharmacists is now immeasurably—this is no exaggerated term—higher than was that of fifty years ago. But importers of foreign commodities have still to walk warily on occasion, as certain cases of adulteration and sophistication which have come under personal notice within the last twenty years should serve to evidence. 'That's the first time I have ever known it occur,' said a merchant when his warehouseman reported that a large piece of stone had been found in the centre of a barrel of imported cakes of African beeswax. 'I must say I've been a bit surprised not to have had a case of the kind before, after reading so much about the dodges that the natives out there are up to.'

In a few years' time, however, he had a more vexatious experience, which savoured of those 'gold brick' tricks that were recorded as having been played upon the 'greenhorn' in Uncle Sam's country. He was supplied, through a firm of London wholesale druggists bearing a well-merited reputation for scrupulous honesty and high-mindedness, with a parcel of what was understood by both consigner and consignee to be 'guaranteed genuine beeswax.' There was not a cake thereof which lacked the proper flavour and outward appearance. It was being disposed of to retailers in the regular way, when there came the surprising intelligence that one of these recipients had been summoned under the Food and Drugs Adulteration Act for selling impure beeswax. A very interesting contention arose out of this as to whether beeswax could properly be denominated a 'drug' or not. The merchant immediately had some slices cut off one or more of the cakes and tested. He found these cuttings were perfectly free from adulteration. But, alas! the indictment proved only too true; the impurity lay in the centre. Blocks of composite paraffin-wax had been thickly coated with perfectly genuine beeswax, so that neither the tell-tale odour nor the different consistency of the adulterant was perceptible until more than an inch of the surface wax was cut through. Thus the importer, the wholesale dealer, and the retailer were alike taken in for the time being.

The Oriental exporter of the odoriferous musk-pod not infrequently causes the British purchaser to discover that he has bought a pig in a poke, for on cutting the pods open to extract the grains of musk for various medicinal and perfumery requirements, it is no uncommon thing—the writer has seen cases of it repeatedly—for him to find that pieces of flannel have been stitched into the insides to add to the weight of the pods. Were anything heavy introduced the fraud would be detected by the first experienced handler; but a little flannel just adds pleasantly to the manipulator's profit. To be fair to such sophisticators, their customary practice is not to scoop out the grains of musk embedded in the pod, so the buyer is usually only swindled to an extent calculated to make him 'smile a hard, set smile,' and then feel thankful that it is no worse.

'I know,' said a trader, holding up a bottle of otto of roses to the light, 'what is said about there being no really pure otto on the market. But when I pay the price for the article classified as "virgin" I don't expect to get something with spermaceti in it like this. I wonder at them being such fools as to put in an article that takes so much higher a temperature to liquefy. They had better have stuck to geranium-oil' (a common otto of roses adulterant).

Sometimes unfounded accusations of adulteration are made by tradesmen whom fears of possible prosecution have made nervously suspicious. The following instance is rather a laughable one. A new-blown young chemist and druggist wrote to a methylated spirit manufacturer in a strain of virtuous indignation, saying: 'Your spirit is abominably adulterated with naphtha; it simply reeks of it.' Whereon he had to be informed that the methylator had not the slightest interest in putting in one drop more naphtha than the Excise officials compelled him to utilise under their inspection to meet the Board of Inland Revenue's requirements; inasmuch as the value of this article was at the moment something like three times that of the

spirit into which it was required to be mixed so as to produce an unpalatable liquor.

On the other hand, there are cases where sophistication has been resorted to deliberately as a means of 'getting even.' 'How do you get on with F. & Co.?' said a merchant to a traveller for a firm of colour manufacturers. 'Oh,' he replied, 'they are mean scamps. They screwed me down to give them special terms for a parcel of goods, and then, when I called on them for settlement, instead of paying by cash or cheque they said, "Draw on us at two months." But I did them,' he added triumphantly. 'When they gave us their next whitelead order we put a lot more whiting into it.' His face glowed with pride at the thought of his Roland for an Oliver. Whiting is known to be an adulterant of whitelead; and sellers of the latter commodity ground in oil for painters' purposes are wont to offer a guaranteed genuine quality to those who will pay the price, and a No. 1, No. 2, and so on, not so guaranteed, to others who want something cheaper. But in the case referred to it was evident that the buyers did not know what they were getting.

Sicily is the chief source of exports of lemon-oil, more generally termed 'essence of lemon.' At one time this was seldom shipped in coppers containing less than seventy or a hundred pounds avoirdupois. In course of years, however, smaller packages, such as thirty to forty pound coppers, were adopted. Then followed twelve-pound coppers, and subsequently five, two, and one pound coppers came to be sold. These smaller packages somewhat facilitated fraud and adulteration, for they could be handled and perforated more readily, and required closer supervision on account of their number. A consular official, who drew attention to the increased Sicilian imports of lemon terpenes and turpentine for this purpose, stated that the lemon-growers customarily passed on genuine expressed essence of lemon to dealers, who in some cases were guilty of adulterating it. But sometimes it was the fault of neither the grower nor the exporter—save that the latter exercised insufficient supervision before actual shipment—that the essence reached the consignee in an impure condition. Cunning thieves were in the habit of boring tiny holes in the bottoms of the coppers (the present writer has noted many a trace thereof), withdrawing a quantity of the lemon-oil, replacing the same by introducing a terpene substitute, and then soldering up the apertures. He recommended purchasers to be cautious as to how they passed coppers which bore marks of soldered-up holes at the base, and not to assume that these were so treated before the completion of the original filling.

Essence of lemon itself used frequently to be employed as an adulterant of the at one time very much dearer citrus product of essence of bergamot. In like manner, many a consignment of the best foreign oil of lavender which comes from southern France, and is termed *sans tiges* as a guarantee that it is derived from lavender-flower distillation only, is blended for cheapening purposes with commoner lavender-oils such as are now much in demand for soap-perfume.

It is recorded that some persons were burned alive at Nuremberg in the fifteenth century for the crime of adulterating saffron, then more used in edible consumption than now; it has to some extent been superseded by aniline colouring, although the saffron-bun is still a speciality in some parts of Devon and Cornwall. Had the penalty been revived in this twentieth century a good many roastings must necessarily have ensued; for, according to an abstract of current work which appeared in the *Pharmaceutical Journal*, October 21, 1905, German authorities found that of one hundred and twenty-six saffron samples submitted to analysis during the last five and a half years, only 56·35 per cent. (not much more than half of the total number) were genuine; 34·13 per cent. were weighted with barium sulphate; 1·59 per cent. with barium sulphate, borax, and nitre; and 3·97 per cent. with borax and nitre. A British pharmacist reported to the same journal some two months later that he had examined samples of saffron which were evidently adulterated with the old-fashioned remedy Rochelle salts.

It is a common saying that the shoemaker's wife goes the worst shod, and to some extent this applies to olive-oil in Italy. What is ordinarily met with on hotel dining-tables there—the writer can speak with more than a year's experience—is far more adulterated than, and inferior to, the better qualities which are shipped in casks to England from Bari and various other ports for distribution through the customers of wholesale druggists and high-class oil-merchants. The latter hear from their customers of zealous inspectors' seizures of samples with equanimity rather than otherwise, knowing that the result will act as an indirect advertisement of the excellence of their shipments; and they are pleased but not surprised when, after receiving a first letter in high-strung tone warning them that they will be held liable for the consequences should any trouble arise out of a recent official analysis of samples which had been taken, they get a second one begging them to be sure to supply a precisely similar article in future, because (this is no supposititious case) the inspector says that 'it is the best quality oil that he has met with in his twenty years' experience.' Still, it cannot be denied that much of the so-called olive-oil which is imported in small flasks, packed ordinarily to the number of thirty in what are termed half-chests, is sadly adulterated, as unlucky housekeepers find, to their cost, when, having ordered oil for salad-dressing, they chance to get served with common flask-oil of a coarseness and odour which ruin the best culinary effort.

Forty or fifty years ago there were many pharmacists who declined to buy olive-oil in any package except the imported earthenware jar or half-jar, containing twenty and ten gallons respectively. Twenty years later importers were wont to say that the jar-purchasers could be counted on their fingers,

so universally had the convenient cask superseded the more picturesque receptacle which druggists of the older school long associated with superiority of contents.

Scientific investigation and testing facilities are now so perfected that the sophisticator may well tremble at the reflection, 'Be sure the analyst will find you out.' This year the centenary of that public safeguard Mr Jacob Bell, founder of the Pharmaceutical Society, will merit celebration; for ever since the formation of that association there have been strenuous and effective workers for the suppression of neglect and carelessness where the handling of poisons is concerned, and the accepted standards of chemical purity are totally different from those which were tolerated formerly.

# THE FORGOTTEN ROCK.

## CHAPTER VI.

We spend our lives in learning pilotage.

HEN he awoke, the sense of rest and a mercifully bright morning clarified his mood and lifted the gray vapours from his mind for an hour; but the day wore on, and the letter from the Bank loomed up again, its sentences in black half-text. By midday the dreary refrain sang again in his mind, 'Three hundred and seventeen pounds within one month! within one month!'

He could see no way out of it. He must start for the North as soon as he had interviewed Lord Criffel. It was curious and characteristic of him that no thought of reward for returning the jewels to their owner occurred to him. He had a trust to carry out. There was an end of it. He must hasten to Cromdale Square, and then get away North as soon as possible. Feeling the now familiar clutch of the belt, he thought ruefully of the irony of the position. Here was a fortune in little, shining stones in close embrace to him, yet the want of money was darkening the horizon, souring the wine of life. 'Twas a strange and difficult world, he thought with a sigh, as he set out on his mission to Lord Criffel. Two out of three of the passers-by had the same thought.

He turned into the Park, slackening his speed as he joined the stream of Sunday idlers. Loud voices of orators with infallible recipes for the housekeeping of humanity reached him, the most of them apostles of revolt against existing affairs, discussing science, the creeds, unbelief, politics, the sexes, peace and war, the millennium, taxation, labour, capital; all sorts and conditions of men listening, some idly langhing at interruptions and their counters, others hanging earnestly on every word. Flett walked on, until a chance phrase, flung over the heads of the crowd, hit him, and he stopped to listen. 'Let us be done with parties of plunder and promises and electoral carrots. The Unionists show their teeth, an' the Liberals slobber over us, but they both 'ate us and are afride of us, and we 're sick—sick—sick of 'em both! Comrades, what we want for every one is the 'old of production and exchange. Then, and not till then, we 'll 'ave a fair division of money, and to-day's rotten system swept away.'

The words came from a gaunt man in a red tie. Here it was cropping up again; the same thought, 'a fair division of money,' voiced at his two casual meetings with the sponger on the Embankment and the friendly policeman. The speaker went on, his raucous tones and unfinished gestures redeemed by the certain savage sincerity in his voice, the passionate conviction in his glowing eye. He rated the crowd, bullying and cajoling them, now calling them comrades, now blind fools, traitors to themselves and their children, harking back and emphasising again and again the millennium for the masses, the control of production and exchange.

A great deal of it was unintelligible to Flett, and indeed to the majority of the crowd; but he listened until the man finished his harangue. It was true, he reflected dully as he went on. There was something wrong with the distribution of wealth. The fallacy that money means happiness was creeping into his blood. The phrases tingled in his ears. Why, the value of even two or three of the rubies in the belt would alone be sufficient for an ordinary man, for himself, for instance, to—— He suddenly stopped, as though some secret pain touched him, a slow pallor mounting in his face. The voices suddenly seemed far away, the crowd blurred and unreal moving figures.

He went slowly forward to a seat, and the thought he was half-afraid of came stealthily nearer. He remembered Westwater's voice: 'Eighty thousand pounds—Amsterdam,' where the jewels could be easily sold. The sweat ran down his face. Instantly he felt a racing ebb-tide in his blood. Two or three of the rubies would mean to him independence, education, prospects for his children. So whispered the velvet-pawed thought, still creeping closer. He saw the vulture of the Bank hopping nearer, his savings gone, the black, uneasy future. He sat staring at the ground, his breathing laboured.

A policeman hurried past with a handcuffed pickpocket, and the sight struck him like a blow between the eyes. He rose quickly, wiping a wet brow, and squared his shoulders. He would go straight to Lord Criffel and fulfil his trust.

He hailed a hansom, and ordered the driver to drive anywhere for ten minutes, and then to Cromdale Square. He would compose his nerves before his interview. Still, there would be no harm in looking again at the rubies, to see if they were safe. Indeed, rightly regarded, it was his

duty. So he convinced himself. Inside the cab, cautiously, vaguely angry with himself, he unloosened the belt, his pulse galloping, and counted the gems. They were safe.

He held the last of them, five bright little devils, in his hand for a moment. So small and trifling they seemed, so—so easily carried. He hurriedly signalled the driver to stop near Cromdale Square, got out, and dismissed him. He was deathly pale, and his face that of one suddenly grown old, for the five rubies were not now in the belt. They were in his pocket. In a dreadful second of time, swift and as sudden as the stroke of an adder, he had stolen them. Even as he rang at the door of No. 9 in the Square a wild, futile desire to replace them in the belt seized him, but it was too late. The door opened, and he found himself inside. He was shown into a waiting-room by a bored-looking footman, and shortly afterwards told that his lordship would see him in a few minutes.

'Captain Whiffler, or some sich nyme, so 'e said, though 'e suttingly didn't appear to me to be a military man; you cawn't tell nowadays. There might 'ave been a touch of the third battalion about 'im,' so the first footman loftily summed up afterwards amid the respectful admiration of the females below-stairs. 'Leastways,' he added tolerantly, 'that's 'ow 'e struck me;' and having thus delivered himself, took up his interrupted study of starting-prices in *Paddock Snips*, while Hugh waited, his heart drumming, until he was shown into Lord Criffel's room.

Gavin John Louis Philip Beaufin, fifth Earl of Criffel, Secretary of State, sportsman, traveller, humanist, owned a rectangular mind, and a soft heart carefully entrenched behind the habit of silence and a horror of advertisement. He also owned half a Scottish county, and wished that he didn't. He raced a little, and worked a great deal. Paradox, epigrams, and grace-notes were absent from his few public speeches, but no human being could read more than one meaning into anything he ever said or wrote. 'As clear as Criffel' said his friends; and the phrase, ringing true, passed into the coined speech of the British public, who believed in the man, his aims, and his horses. The Order of the Thistle was his, and a famous salmon-fly was christened after him. It is doubtful which of these guerdons he valued the higher.

Hugh found himself beside a man of about his own age. The captain was pale and unnerved, and the room spun round once and back again before it steadied. Lord Criffel looked at his visitor kindly, curiously. He liked his looks, but a child could have seen that the man was under the heel of some masterful emotion. Hugh, for the first time in his life, was in the agony of trying to avoid another man's look. He failed, but the other man's kindly brown eyes eased his taut nerves a little. The gentleman whom he intended to cheat motioned him to a chair and sat down beside him. At the sound of his well-bred, friendly voice Hugh breathed more freely, and his tongue no longer felt one with his parched mouth. Then his native instinct for direct speech came to his rescue.

'My name is Hugh Flett, my lord,' he began—'master o' the steamship *Covesea* of Findburgh. I have a—a message to deliver.'

There was a pause. Lord Criffel was a man of few words. He nodded. 'From?' his eyes asked.

'I don't know his real name, but he gave me for you what I've good reason to think are your lost rubies.'

Lord Criffel was, and very nearly looked, astounded; but he said nothing, searching the other's face. The light from the window fell full on Flett. Lord Criffel looked at him steadily. A monomaniac? A thieves' emissary? A commonplace, easily dealt with blackmailer? The man looked none of them.

At last the Earl broke the silence. 'This is an extraordinary statement,' he said.

'No doubt, my lord; but I've brought them wi' me. They're here,' blurted out Hugh, and slapped his side. 'I'll show them to ye.'

He unbuckled the belt with a sigh of relief, his hands trembling, then took it off, unlaced it, and held it up by one end. A bright trickle of gems ran out, settling into a glowing pool in the light, sparkling joyously in their freedom.

Their owner looked at them incredulously. Then he turned them over, one by one, as though he feared that his senses were playing him a trick, and that the twinkling points of fire would vanish to join their fairy comrades in the sunbeams. But they were real, and he recognised them. They were his. At last he laid them down, and turned again to the captain.

'This is an amazing piece of good fortune,' he said. 'We had given up hope of them. My wife will be delighted! Delighted! I wish she had been at home, but she is in the country. Tell me the whole story. We shall not be interrupted.'

Flett began to tell him the story from the beginning of Westwater's coming to Findburgh, his sailing for Finland, the scene down the cleft on the lonely isle, and the dying man's message. The Earl listened intently, taking a few notes, breaking in with a salient question here and there. Flett's voice steadied as he talked, and the story was soon told, down to the last scene in the wild North Sea. Lord Criffel rose and held out his hand.

'I cannot thank you in words, captain. Fortunate for us that they fell into such good and honest hands.'

Hugh winced and allowed his hand to be shaken. He was perhaps at that moment as miserable a man as there was in all London. But he had to dree his weird, and went on hurriedly, scarcely believing his own ears.

'So, my lord, there they all are, just as I got them from him. And—I nearly forgot—he asked

me to give you this.' He handed the Earl the little book. The other man looked at it for a moment, and opened it. It was a well-worn pocket Horace, and on the inside of the cover, in his own boyish writing of twenty years before, the words: '*To Larry. "All rising to great place is by a winding stair." Christmas, 1887.*'

'He said you would know who sent it, and that no one else would,' said Hugh.

'I do,' said the Earl, an infinite sadness in his voice. He rose and looked out of the window, the book in his hand. The dusty Square vanished, memory winging back to the shouts of the playing-fields, a boy-comrade, and the cloudless skies of youth. After a long silence he turned round again to Hugh.

'I do not give you his name, and I ask you not to try to discover it. Let us keep this to ourselves. You are a man in ten thousand, and I trust you. He was, as he said, my friend once; but—he steered first recklessly, then badly, then drifted to the forgotten rock.'

'The Forgotten Rock!' exclaimed the captain. The other looked at him.

'My lord, that was the very name in Finnish of the island that I found him on.'

'A coincidence. Curious enough. I used it figuratively of course. Most of us think we know our charts, and leave out of account some forgotten rock until we graze it or crash on to it,' the Earl went on musingly. 'Who knows? Ambition. A pair of bright eyes. A horse. Who knows? Ah, a voyage is never over until one's foot is on shore.'

He unlocked a drawer in a cabinet and brought out some papers.

'This is the description given to Scotland Yard, and a jeweller's sketch of the settings,' said he. 'The settings are not there, of course.' He counted the stones. 'Only five missing. Well, I cannot grumble; I'm lucky to have had such an upright man as yourself as trustee for me.'

Poor Flett winced again. It was well that the Earl, bending over the paper, could not see the other man's face.

'I shall give you an acknowledgment for the rubies, and a little—souvenir of to-day. By the way, captain, another coincidence. This is the Fourth of July. A great many people call it "Independence Day." I hope and think that you will.'

He sat down again at his table for two or three minutes, put what he had written in an envelope, and sealed it. Hugh took the envelope mechanically. He was scarcely conscious of the other's voice. A wild desire to get away from the kind brown eyes seized him. The very presence, wholesome and transparent, of the other man, the sense of sincerity in his fibre, stung Flett like a quiet, accusing voice. 'Good and honest hands!' 'A man in ten thousand, and to be trusted!' 'Upright man as a trustee!' the words rang within him, searing his heart. *His* word, his worthless, lying word, had been taken! He had been honoured at sight.

Lord Criffel saw his face working. He put it down to embarrassment at the hint of reward conveyed in 'Independence Day,' some admirable delicacy of organisation in the captain, and thought it kinder to shorten the interview.

'You're a little overwrought now, captain. You must have felt the strain of carrying the rubies about for so long; but come back and see me next time you are in London.'

He shook hands heartily, and in another minute Hugh was out into the misty brightness of the streets.

It was a warm summer day, but he shivered, a cold rain in his blood. He quickened his steps, hastening away, anywhere away from the neighbourhood of the kind voice and the steady brown eyes that had lit up when their owner called him an honest man. Crowds passed him, with the Londoners' quick, interested glances at every one and everything; and to his mind, sensitive as a weather-glass in its misery, their careless, cheerful voices jarred on him—almost, he thought, questioned him. He felt desolately alone, yet pointed at, in a world of imagined mocking faces; a man apart, in the midst of his brethren. The new strange chains of his shame rattled. He almost hoped they would soon become mercifully intimate. His shoulders gradually lowered, and a sulky, cowed voice, his own, whined within him. Why had Fate thrown him in the way of temptation? It was scarcely his fault, was his bitter thought, as he reviewed his life, in a pathetic last salute to his murdered self-respect.

Till then he had been so happy, so unconscious of it. Till then no one could accuse him. Till then he had been loyal to his employers, to his home, to himself. He had been more upright than the average man, said the hidden Pharisee in him. He had been tempted unfairly. The value of the jewels, a bagatelle to their owner, meant freedom to him. No one would know, and it would be his one and only stumble. He would swear that.

So he temporised; and even as he trifled with these poor mental anæsthetics he felt the burden of his shame settling like lead on him. He strangled a cry. It was an unjust and monstrous world. The sponger on the Embankment, the policeman, the man with the red tie in the Park, were right. They were right, he repeated, jaws and hands clenched. Ease, power, money for a few; care, temptation, poverty for millions. Wounded at the heart by himself, he cursed the universe. A flower-girl, offering shining blossoms, looked on his face and shrank back afraid.

Suddenly he remembered the unopened letter in his pocket, and as he took it out there slowly came to him the remembrance of Lord Criffel's words: 'Independence Day.' He had not thought of them at the time; indeed, his wits had been benumbed, but now the sudden truth flashed on him. The gentleman whom he had cheated believed him, trusted him, rewarded him. Here, in his hand, was doubtless the evidence. He saw black ingrati-

tude marching along with his cowardice, as he looked at the unopened letter, and at the thought he stopped dead, slowly shedding the thin rags of his self-deception, his soul hanging in the balance.

Comes there sooner or later to every one (except the complete and unlimited fool) at least one swift moment in his life when there is revealed to him as in an uncompromising awful mirror his own startling image. The vast majority of men shut their eyes or flee from the sight. Hugh saw himself, and as he looked there was borne to him on a freshet of memory Westwater's sudden question on a white northern evening: 'Do you find it easy to be honest?' His self-sufficiency became a breaking wreck, his poor sophistries scurrying like rats before a sudden light. A wave of humility, shame, and understanding surged over him. His manhood triumphed.

He put the letter back in his pocket unopened, turned on the instant, and walked without hesitation, drunk with resolve, straight back to Lord Criffel's. He would weather this black day, come what might.

The bored-looking footman admitted him again, and looked at his face curiously. 'Drinking,' he thought, with the glib verdict of his class.

Lord Criffel was busy over some papers when the captain entered, but looked up quickly on hearing Hugh's changed voice.

'I've come back,' said Flett grimly, almost in a whisper. 'I've come back to tell ye somethin'. First of all, my lord, ye must take back this envelope and whatever it holds. I have not opened it.'

He put his hand into his pocket, brought out the envelope, and along with it a little twist of paper, and laid them both on the table. His hand shook, but his voice was under control, and his eye, too bright, met the other man's steadily. Lord Criffel waited, wondering at the trouble in his voice. Hugh pointed to the twist of paper.

'There are the missing five stones, my lord,' he gulped. 'I—took them—I took them. I 'm a'—— He sank into a chair, his face in his hands.

'And you came back with them!' said the Earl.

Flett nodded, without looking up.

There was silence for a minute. 'I suppose,' Lord Criffel soliloquised—'I suppose I ought to send for the police.' He looked again at the crushed man. 'The Forgotten Rock again,' he thought.

There was a long pause, then the touch of his hand on the captain's shoulder, and his voice near him.

The two men sat for long together.

. . . . . .

At the end, 'Good-bye, captain,' said the Earl. 'I called you an honest man before, and I do so now.'

He held out his hand. The other man grasped it without words, went out again to the London streets, but with sunlight in his heart, head and shoulders erect, and the light of struggle and achievement in his eye. Hugh carried with him, in addition to the blessed sense of duty done, a cheque that spelled 'Independence Day' for him and his. Lord Criffel, looking out of the window, watched him stride across the Square.

'Few men could have done it,' he said to himself.

He took up the little Horace, and looked at it, then locked it in the cabinet with a sigh, and plunged into his day's work.

. . . . . .

Next day, speeding northwards in the Highland train climbing the steep slope of the Grampians, Hugh watched gratefully the stately unfolding of the hills. The warm, wild scent of the peats reached him as the train stopped at little wayside stations; and hard accents fell on his ear, sweet and friendly. He was at peace with the world. The first glimpses of the early heather (so dear to the returning Scot); the song of hill-burns pelting in changing flashes, white, tawny, crystal; the popping rabbits in the bracken; the careering, chasing cloud-shadows sailing on the green rollers of the hills; the climbing terraces of woods; remembered sounds, remembered landmarks, wardens of the Northland welcomed him, and saluted his entry. 'Pass, friend; all's well!' This was 'his ain countrie.'

Farther north, and here were the bright shields of Loch Garry and Loch Ericht, there the dark, swift dots of a covey of grouse skimming along the line of empty butts on the hill. The familiar snow-fence ran along beside him, bordering the brown stretches of the moors. Still north, and the Spey sang a song of old glens; then down through the leafy western gate of the Garden of Scotland, until he saw, in a quick lift of the green arras of the pines, waving battalions of barley, a bright, gleaming scarf of sand, and beyond, the blue welcoming eye of the Firth, red sails, and the moving neighbourhood of home.

. . . . . .

He bound his wife to secrecy, and told her the story, except the part of it relating to his dark hour in London. His courage had limits. Jean had listened to the narrative in a maze of astonishment and joy, tempered by her vow of secrecy, that barred her from a royal progress with the news among her neighbours. Their own good fortune had been discussed, appraised, and duly wept over by her; and now, two or three days afterwards, the first excitement over, Hugh and she were in the garden.

'I hope the siller winna be a snare, Hugh,' she said.

'I'll risk that,' answered Hugh promptly; 'the want o' money is a worse snare, I'm thinkin', than a bank account.'

'Isn't it a providence that the jewels got into sic safe hands as your ain, my man?' she went on.

Hugh was silent. There was a pause. He looked

seawards, his mind speeding back to a white northern evening, then to a man's wide resting-place in the North Sea.

'Lord rest his soul!' he said.

'Hugh!' broke in his wife, following his thought, 'that's surely prayin' for the deid. Forbye, he was a bad man!'

'He'll be the mair in need o' prayers maybe. I canna tell. An' ye'll obsairve, Jean,' he continued with a hint of authority, 'that I'm on my ain hearth-stane. There's worse faults than prayin' for the deid. Keep a lookout for the Forgotten Rocks.'

'Forgotten rocks?' said Jean.

'Ay! they're whiles one danger, whiles anither. They're often blind Conceit o' oorsels, and Want o' Charity for our neighbours, my lass.'

He went forward alone to the brow of the hill. Something huge, ceaseless, and inevitable in the regular crunch of the waves on the beach beat on his senses, marking off in the mystery of its escapement the relentless passing seconds of Time. Below him lay the mean place, raucous wrangling voices rising from it; the kirks staring sullenly at each other, smoke hanging like a miasma over the featureless streets.

But beyond them stood the strong, abiding hills; the bright, white column of the lighthouse arose straight and definite in the sun; and far above the snarling town the top-gallant yards of an anchored schooner engraved a Cross on the clean skyline, where the great wheel of the heavens met the sea.

THE END.

---

# PHOTOGRAPHING THE HEART-BEAT.

We have become so accustomed to the wonders which modern science has been enabled to accomplish by means of photography that we are no longer surprised when some new and important discovery is announced. The service which photography has rendered by its application to science within recent years has proved so invaluable that one may now with truth say that photography is become the handmaiden of science. However useful photography may be as a pastime or as an art, there can be no doubt that in conjunction with science it has rendered such invaluable service to mankind as to have become practically indispensable; and in no other branch has it proved more valuable than in medical science. In this field it has added considerably to the lot of human happiness, since by its means operations have been made possible which were once considered impracticable, and it has been of considerable help in the alleviation of suffering. In this connection one need only mention the discovery of the Röntgen rays and the various inventions to which it has led. The latest of these is a contrivance for photographing the beating of the human heart, which is in itself almost as astounding as was the original invention. Although the new contrivance is of quite recent date, its practicability is proved by the fact that it has already been introduced into most of the important physical laboratories on the Continent. Before proceeding to describe the method of photographing the heart-beat, it may be as well to initiate the reader into some of the mysteries of the invention. The patient whose heart is to be examined is ushered into a pitch-dark room from which every ray of light is excluded. Without removing his clothes or making any other preliminary preparation, he is invited to sit down on an ordinary chair before a large glass bulb. Then the operator switches on the current, and in response the electric sparks hiss in the glass bulb, filling it with a pale-green light. Then the operator holds in front of the patient a plate which has previously been prepared with a compound of barium platinum. On to this is thrown a clearly defined image of the heart, and the electric rays are so arranged that the shadow of the rib-bones is scarcely perceptible, and does not in any way interfere with the examination of the fleshy mass forming the heart. So distinct is the image that one can clearly observe the opening and closing of the valve as the blood is being pumped through it. Needless to say, the patient feels nothing whatever during this operation. So far no photographic emulsion has been discovered which is sufficiently sensitive to record the movements of the heart as seen on the barium platinum screen, though it is expected that before long it will be possible to transfer this action on to a cinematograph film. Because of this difficulty another means has had to be adopted, and the movement of the heart as seen on the screen is recorded on what is called an electro-cardiagram. In order that this may be obtained the patient has to place his bare arms in two large vessels filled with water. Into each of these vessels a copper wire is led which is charged with electricity. Where these wires meet a very thin platinum wire is attached to them, resting within a highly charged magnetic field. As soon as the contact is completed this platinum needle begins to move, its movement being regulated according to the strength of the electric current passing through it. Since the human body is a conductor of electricity, the contact-circuit is made whenever the patient places his arms in the vessels of water into which the wires are led. It naturally follows that the movement of the needle follows the contraction and expansion of the heart, impelled by the electricity generated by the action of the muscles of that organ whilst performing its function. When these contractions are strong the swing of the needle is much greater than when the contractions are weak. Under

this moving needle a photographic film is slowly passed, and the light above it so arranged that a faithful imprint of the beating of the heart is recorded on the electro-cardiagram. It is hoped that this new discovery will afford doctors the means of studying more carefully and closely the heart and its action, enabling them to treat more exactly the various diseases of the heart which have until now been more or less a mystery to them.

## THE SOLITARY GUEST.

### CHAPTER IV.

THE Boar's Head Inn was a very comfortable place, and, as Captain Compton had said, it formed a delightful contrast to his grimy London lodgings. He was sitting in its garden smoking his pipe in great contentment when a footman from Grangemuir brought him a note.

Captain Compton saw the man coming along the village street, and guessed who it was. 'Here comes the money,' he said to himself with a chuckle. 'What a precious ass I was not to say a cool hundred pounds while I was about it!'

The note requested Captain Compton to send the written statement he had promised, and enclosed a cheque for fifty pounds. Captain Compton called for pen and paper and sat down to write.

'What an innocent the old man is!' he said to himself. 'I suppose it never struck him that I might just take the money and go off. I might send a line of acknowledgment, and by the time this stately flunkey was back at Grangemuir I would be on my way to London. But I am not such a cad as all that. He says that I am to promise to be absolutely silent on the matter of his son's marriage until his son's return. No, no, Sir Leslie, I never said that. All I said was for two months, in which time his son was expected to return; but these Government Commissions have a way of exceeding their time, and I may quite hope to be having another interview with Sir Leslie at the end of two months.'

The unsuspicious old Sir Leslie locked away Captain Compton's note in the most secret recess of his safe, and felt that he had for the time averted the blow which was to fall on his beloved daughter-in-law.

Fifty pounds is not a very vast sum of money; indeed there are many thousands of people in the world to whom it would seem a mere bagatelle. On the other hand, there are many millions of people to whom an unexpected fifty pounds would give a feeling of absolute prosperity. Captain Compton was one of the millions, and this unexpected fifty pounds did great things for him. He astonished his landlady by placing a ten-pound note in her hands; he bought himself a new suit of clothes, in which he sallied forth to pay visits in hopes of picking up a few invitations to dinner; he began to wish that windfalls of this description would come a little oftener; and before the two months were over he was debating in his own mind whether or not the piece of paper with his written promise had any real binding effect.

'Supposing I broke the promise, what would happen? Could I be had up? I wish to goodness that I could find out. It would, of course, be a pretty caddish thing to do; but when a man is hard-up he can't afford to be particular. How much would Montague Howard give for this information?'

Captain Compton was careful to keep himself well posted in the movements of the South African Commission, and great was his joy when a small paragraph in the papers mentioned that, as the work of the Commission had turned out to be more complicated than was at first anticipated, they would be a month later than the original date fixed for their return. Captain Compton rubbed his hands and walked up and down his room, whistling in the exuberance of his joy.

'This makes it plain sailing,' he said. 'Having paid for silence during two months, Sir Leslie won't want the matter to come out at the last moment before his son's return. He will be all the more ready to pay down the money now that he sees he can really trust me. He paid his money, I kept my promise. If he pays again I keep it again; if he won't pay he takes the consequences.'

It was two months to a day from the time that Captain Compton had first visited the 'Boar's Head' when he again arrived there from London. The fact of the footman from Grangemuir having brought him a note the last time that he was there entitled him to greater respect on the part of the landlady, who began to relate the news of the place as she put an appetising lunch before him.

'You will perhaps be going to Grangemuir, sir; but you will find things sadly changed there, as perhaps you may have heard.'

'Changed!' said Captain Compton. 'In what way?'

'Poor old Sir Leslie is sadly changed, sir. A couple of months ago he was as hale and hearty a gentleman as you could find in the whole county, and now he is as haggard and white as ever you did see a man. The doctors they do keep saying that there is nothing wrong with him; but they can see that he is fading away. And his own man, who drops in here now and again, tells me that he seems to have something on his mind that keeps him from sleep, and he used to be such a good sleeper too, was Sir Leslie.'

'And young Mr Howard is not back yet?' asked Captain Compton.

'No, sir. It was a terrible blow to the old gentleman when he heard that his son was to be another month away. They say as how he took on terrible when the letter came with the news. And that poor, sweet young lady, she is fairly distracted, what with her husband away and Sir Leslie in such a sad state, and even the doctors not knowing what to do.'

Captain Compton set out to walk to Grangemuir, feeling a little guilty, but still determined to do what he could for himself without much consideration for any one else. When he had last passed through the heavy iron gates it had been summertime. The surroundings had been very beautiful then; but they were still more beautiful now, for the autumn leaves of the beeches seemed absolutely to flame under the bright sunshine, and the bracken formed a yellow carpet beneath the firs. The old house, with its rich covering of Virginia creeper, lay very still as Captain Compton approached and aroused the echoes by ringing the bell.

He was at once admitted, and when he entered the library he saw that the statements of the landlady of the 'Boar's Head' were no exaggeration. Sir Leslie was indeed sadly changed. Instead of the ruddy, stalwart old man he had seen before, a wan-looking, bent figure stood up to receive him.

'How are you, Sir Leslie?' said Captain Compton. 'I am afraid you are not very well.'

'Not well!' said Sir Leslie somewhat bitterly. 'How could any man be well after hearing such news as you brought me?'

'Oh, come, you take it too hardly, Sir Leslie,' said Captain Compton. 'I have kept my ears and eyes open, and assure you that there has not been the slightest whisper in any quarter of what you and I know. I need hardly say that I have been absolutely silent on the matter.'

'But the fact remains all the same,' said Sir Leslie—'the hideous fact! Would to heaven that I had summoned my son home by telegram immediately on seeing you! But his work was important, and it might seriously have affected his future career had he suddenly thrown it up; and I did not wish to upset his mind by telling him of what had transpired.'

'Oh, well,' said Captain Compton, 'your suspense will now soon be at an end; there are but four weeks before Mr Howard will be home. Have you spoken of the matter to any one?'

'To no one but my family lawyer, and that of course in the strictest confidence. To tell the truth, I was in hopes that he might be able to tell me that it was a false alarm; but I regret to say that he only confirmed your information. There appears to be no doubt that the marriages performed at that church at that particular date did not constitute legal ceremonies.'

'Of course not; you might have rested assured that I would not have alarmed you without making myself quite certain of the facts. Now, Sir Leslie, what about the future? The two months for which I promised to keep silence are at an end.'

'At an end!' exclaimed Sir Leslie. 'Surely you promised to keep silence till my son returned?'

'No, no, not at all,' said Captain Compton quickly. 'If you will read the written promise I sent you, you will see that it is clearly stated that I was not to mention the matter until the end of two months, when Mr Howard was expected to return. If Mr Howard does not return, that is his affair; the two months are at an end.'

Sir Leslie sank back in his chair. 'Do you mean to tell me,' he said, 'that you consider yourself no longer bound to silence?'

'I am certainly no longer bound, and, as I told you before, some newspaper will pay me for this bit of society gossip. Your son is becoming a prominent man, and the public will be interested to hear of the curious state of his family affairs—his son not his legal heir, his wife not his legal wife.'

'You scoundrel!' burst from Sir Leslie.

The two men were so intent on their conversation that they never noticed that the heavy *portière* which hung over the library door had slightly moved, and was being held aside by a woman's hand.

---

## CHAPTER V.

'YOU are pleased to call me a scoundrel, Sir Leslie,' sneered Captain Compton; 'but if you were in the circumstances that I am in you would probably act in just the same manner.'

'No, I would not,' said Sir Leslie hotly. 'No man with the slightest claim to being a gentleman would try to make money in such a way. What is it you want now?'

'Same terms as before,' said Captain Compton; 'fifty pounds, or I go to the Press to see what they will pay—not so much as that, I grant you; but you are a rich man, and it is worth your while to pay well to keep your family affairs from being dragged before the public.'

'You mean that you want another fifty?' asked Sir Leslie.

'Yes,' said Captain Compton; 'and you are getting off cheap with that. Most men would have made you pay up a hundred. I advise you to give me the money, Sir Leslie; it would be a poor home-coming for your son to find his wife's name in the papers.'

Sir Leslie sat for some moments with his face in his hands. 'You shall have it,' he said slowly, rising to his feet.

'No, you shall not; not one single penny shall you have,' said an angry voice from the end of the room.

Both the men turned hastily with faces of blank

amazement, and by the door they saw standing Sibyl Howard. She advanced into the room, the face that was generally so smiling and happy now set and angry.

Captain Compton was the first to recover himself. 'Delighted to see you, Mrs Howard,' he said; 'though I fear you have heard what must be painful to you.'

She took no notice of him, but going up to where Sir Leslie had dropped on to his chair, overcome with surprise, she laid her hand on his head. 'You poor, dear old dad!' she said; 'I understand it all now. While we were consulting doctors and trying to find out what was wrong with you there was nothing whatever the matter except that this wretched man had been worrying you. Why did you not tell me, instead of fretting over the matter yourself? You really should have told me, dear.'

'Sir Leslie and I have been most anxious to keep this painful matter from you, Mrs Howard. I have been very careful that no hint of it should escape from me.'

'You have been careful of nothing but your own pocket,' she said haughtily.

'Well, well,' said Captain Compton, 'we naturally look at the matter from different sides.—Now, what is it to be? Do I have that fifty pounds or not, Sir Leslie?'

'Not!' broke in Mrs Howard. 'Certainly not.'

'Then you must not be surprised if you see your own name in the papers in a day or two. I don't know how much you overheard of our conversation. Permit me to state the position to you in a few words. It is clear that your marriage was not a binding ceremony; therefore you are not Mr Howard's legal wife, and your children in the eyes of the law are bastards.'

Mrs Howard grew scarlet. 'How dare you?' she said. 'For that I shall send for the police and have you taken up.' Crossing the room, she laid her hand on the bell.

'Taken up!' laughed Captain Compton. 'Because I tell you an unpleasant fact you think that I am a criminal! But we all know that logic is not a strong point with ladies. I suppose you think that the law will make an exception on your behalf.'

'I want no exception made for me,' she replied hotly.

Captain Compton felt a little surprise at her attitude.

'May I ask you a question, Mrs Howard? I saw you married in the church at Yokohama, but were you afterwards married at the Yokohama Consulate?'

'No,' said Sibyl Howard, 'we were not married at the Yokohama Consulate.'

'Then,' said Captain Compton with a smile, 'I am afraid that I was quite correct when I said that the law would look upon your children as bastards.'

When Mrs Howard rang the bell the butler had appeared at once at the door, where he stood with a face like a stone image, but eagerly listening to the remarkable conversation, which was indeed a tit-bit for him to relate in the servants' hall.

Mrs Howard now turned to him. 'Forrest,' she said, 'send a groom on horseback to the village, and ask the constable to come up here at once.'

Sir Leslie, who had been listening in a dazed sort of way to the conversation, now roused himself.

'Stop, Sibyl, my dear,' he said.—'Stop, Forrest, stop!—There is nothing that can bring Captain Compton under the law. He has taken advantage of his knowledge of a painful fact.'

'Painful fact!' she interrupted. 'There is no painful fact at all.'

'I am afraid that there is,' said Sir Leslie, 'for I went and laid the matter before our lawyer, and he confessed that Captain Compton's information was quite correct, and he is waiting as impatiently as I am for Leslie's return.'

'There is no painful fact at all,' she repeated positively; 'and I want this man taken up, for he has given you no end of unnecessary suffering.'

'My dear,' said Sir Leslie, 'don't keep me in suspense. I am not able for this strain. Is there something about the matter, that I don't know, that alters it?'

'Yes,' she said, 'there is. But I did not mean to tell you the facts of the case before Captain Compton; but since you wish it I will tell you now. After our marriage Leslie received a note from the clergyman to say that though he believed the church to be properly licensed for marriages, yet he considered that it was better for us to avoid any difficulties by going to the Consulate. We did not wish to go back to Yokohama, but we gave proper notice and were married at Kobe Consulate. We have always considered that our church marriage was our real marriage, so there was no need to speak to any one of the other ceremony; but in case of any question Leslie has the papers.'

Sir Leslie gave a great sigh.

'Oh you foolish old dad!' said Mrs Howard, 'why did you not come to me instead of going to lawyers?'

Captain Compton stepped quickly to the door.

'Shall I stop him, ma'am?' said the butler, who was still stationed like a carven image at the door.

'No,' said Mrs Howard with a laugh; 'he is not worth it. Let him go.'

He went.

THE END.

# BOY SCOUTS.

## HOW GENERAL SIR BADEN-POWELL'S SCHEME MAY BENEFIT THE NATION.

By Basil Tozer.

'THE nation that loses self-control,' President Roosevelt remarked recently, 'is lost.' Though not an original observation, this statement of the President's was widely quoted by the American newspaper press, owing probably to its being one of those platitudes which, almost forgotten, sound like philosophical utterances when suddenly revived. There is no reason, however, to suppose that President Roosevelt had the British Empire in his thoughts when he repeated it. On the contrary, he had, according to the newspapers, just made complimentary comments concerning the British nation. Several of the Continental journals, nevertheless, at once made the President's statement a peg upon which to hang adverse criticism of Britain and her ways. They compared those events which immediately preceded the fall of Greece and Rome with events that have occurred in Britain in this century. Such criticism is, of course, not pleasant to listen to; for, say what we will, we cannot deny that a vast section of this nation has for years been steadily degenerating, and that through the very causes that brought about the Roman Empire's fall. Rome, led by Cicero, it will be remembered, grew from being a nation composed of practical men of action into a nation that merely talked. Can it be denied that we appear to be, by a similar course of evolution, developing into a race that talks rather than acts? Then, one of the most remarkable occurrences that took place in Italy in Cicero's time was the sudden influx of the rural population into the cities, and the decay, in consequence, of the agricultural industry. We read that 'the vigour of the country people seemed all at once to depart from them;' also, that 'in place of taking part themselves in the sports popular at the time, the people of Rome quickly acquired the habit of becoming spectators only.'

We in Britain to-day have not far to seek to find instances almost similar among our own people. An eye-witness has stated that he saw 'a dozen men of the Guards Brigade fall out during a review at Aldershot when their duty consisted merely in standing at attention for rather a long period'—reference to this incident is made by Mr Elliott E. Mills, the well-known authority and writer upon questions relating to sociology; and many similar instances of physical degeneracy could be given. Indeed, but few years have passed since the standard height and chest-measurement for recruits for the British army had of necessity to be lowered; and yet we know that even now many thousands of would-be soldiers are unable to reach the level of physical and mental soundness necessary to qualify them to serve their country.* Consequently it was more than time that practical and decisive steps should be taken to improve the failing stamina of the British race in Britain, first by dispelling the feeling of lethargy, lack of ambition, and disinclination for action that has been taking so firm a hold of us of late years; and, secondly, by strengthening the nation's gradually dwindling power of self-control which makes it seek in life only personal gratification and pleasure. In order to bring about this change it was necessary, in the first place, that the youth of the whole country should be stirred into activity, that their moral fibre should be stiffened, their energy, mental and physical, renewed. There was but one way thoroughly to effect so radical a transformation. It lay in generating in the great mass of the youth of this country an *esprit de corps* that should make it appear to them shameful for Englishmen individually or as a body to lack either moral or physical courage, self-control, or self-respect; shameful also for them to be unenterprising, unintelligent, or discourteous, or to be wanting in patriotism, loyalty, and honour.

* The manœuvres of some weeks ago have revealed an improvement in this respect.—B. J. T.

[*All Rights Reserved.*]

Attempts to create these changes and stir up public spirit had been made by clergymen, philanthropists, and individual reformers at intervals for years past, but with inconspicuous success. Some of the schemes advanced lacked practicability. Others were too 'pronounced.' Several were hampered by what can only be termed 'religious disabilities,' while in almost every case the boys' own instincts and inclinations—'boy-nature,' if one may call it so—were not taken into consideration. We have to thank Sir Robert Baden-Powell for initiating at last a system which combines the advantages of practical secondary education with health-giving recreation, and that promises to revolutionise the youth of this country by stamping out the spirit of idleness, disinterestedness, false democracy, passive insubordination, and general hatred of anything in the least resembling authority or discipline, while at the same time fostering industry that comes of true interest in occupation, developing self-respect, self-control, consideration for the feelings of others—the truest form of courtesy—ambition, physical and moral courage, and cheerfulness.

Seven questions of importance have repeatedly been asked during the past year by persons in sympathy with the movement and seeking information prior to enrolling their sons, as well as by sceptics antagonistic to it. These questions are: (1) What is the true *raison d'être* of the scout movement? (2) Are the boys being taught only what it is desirable that they should know? (3) Is not the training they receive calculated to unsettle their minds—that is to say, make them wish to live an outdoor life, whereas the majority will never have an opportunity of doing this? (4) Does not the curriculum tend to militarism, to which so vast a section of the nation is opposed? (5) Is any thought given to the question of religion? (6) Is the information the boys receive, or any of it, of true educational value? (7) What practical good can come of the scout movement? Will its training and instruction actually prove beneficial to the boys in after-life, and consequently to the nation indirectly; or is it, when 'stripped of the talk,' only a game enjoyed by the boys but unlikely to make a lasting impression upon their characters?

For the *raison d'être* of the movement we have not far to seek. Proof has just been given that through lack of self-control, strength of character, manliness, and general intelligence, the nation's military supremacy, her leadership in commerce—in short, her greatness—are declining. The question, 'How is this decline to be arrested?' has already presented itself, and up to a point it has been answered; for the inception of the scout movement, so far as can be seen at present, seems about to solve the problem. Every boy upon being enrolled promises on oath to do three things: (1) Be loyal to God and King. (2) Help others whenever they need help. (3) Obey the scout law.

The scout law he thus solely pledges himself to observe is as follows: Never under any circumstances will he break his word. Differently put, this means that every scout trusts implicitly the word of honour of every other scout. He is to be loyal to his King, to his officers, to his country, and to his employers. His duty is to be useful, and to help others. He is to be a friend to all, no matter of what standing or social rank. He is to be courteous always. He is to be a friend to animals. He is to obey instantly, and without question, the orders of those in authority over him. He is to be cheerful under all circumstances, or strive his best to be. He is to be thrifty, but never mean. Lastly, the motto of the Boy Scout is, 'Be Prepared'—he is always to be in a state of readiness, mentally and physically, to do his duty. By being prepared mentally he will know the right thing to do in any case of emergency. By being prepared physically he will be sufficiently strong and active to do the right thing at the right moment.

Here, then, we have the true object of the scout movement. Briefly summarised, it is to raise the moral tone and increase the physical fitness of future generations by training up the boys of the present generation to be manly, honourable, loyal, patriotic, brave, intelligent, self-reliant, and courteous, and thus help materially to restore Britain's dwindling greatness. Only two years have passed since the scheme was inaugurated, and already there are in the United Kingdom alone no less than one hundred and fifty thousand scouts, while recruits continue to pour in every week. In addition, the popularity of the movement has spread by leaps and bounds, not only among the boys themselves, but among boys' parents of all classes and in other countries besides our own. The beneficial effect the movement is having upon the nation is already being felt. In our great cities, as well as in provincial towns and country districts, the scout movement is being talked about, and everywhere the manliness, the resourcefulness, the utility, and the courtesy of the lads have been observed. How useful some of these boys have proved themselves in cases of accident and emergency, the number of lives they have—thanks to their knowledge and general intelligence, and in some instances to their personal bravery—been instrumental in saving, reference to statistics filed at the scouts' headquarters will show.*

The question, 'Are the boys being taught only what it is desirable that they should know?' can be answered almost as easily. This is best answered by enumerating the principal things the boys learn. They are taught scoutcraft, which includes the art of stalking wild creatures and following their tracks, camping and outdoor life, woodcraft, the names and ways and peculiarities of animals and birds and insects, the calls of animals and birds, interesting facts about trees and plants, how to find the way by

* The number of lives saved by the Boy Scouts during the last six months has been, on an average, five a week.—B. J. T.

the sun's position during the day and by the position of the stars at night, pioneering and general resourcefulness, deduction of the kind that appealed to Sherlock Holmes, how to be observant, knot-tying, hut-making, bridging, cooking and bread-making, the right way to fell trees, how to judge heights and distances, how to identify fish and reptiles of various kinds, and many items of information of the same nature which interest most boys and that may some day quite possibly prove of use to them. In addition, the curriculum, if it may be so called, comprises instruction in life-saving and first-aid, general campaigning, signalling with flags and by Morse code, the right and the wrong way to fly British flags, how to gain health and strength and retain both; also narratives of chivalry, endurance, and bravery, instruction in the right way to harness horses, in exploring, watermanship, mountaineering, weather-wisdom, path-finding, finding the north, boat-making, how to rescue from fire and from drowning and from a runaway horse, how to tell if a dog is mad, what to do if met by a mad dog, how to treat snake-bites, how to carry an unconscious person, what to do to a person in a fit, how to stop bleeding, simple ambulance-work, marksmanship with crossbows and air-guns, boxing, and a very great deal more of the same nature.

Against this the threadbare argument has been urged that a little knowledge is a dangerous thing. In connection with these scouts and their work, however, we have proof in plenty that a little knowledge, if of the right kind, may upon occasions prove a valuable asset. Certainly the critic who can assert with conviction that boys of any class would be better left in ignorance of the information just catalogued must possess peculiar views. No mention has been made of the many outdoor and indoor games that the boys are taught, all of which, besides appealing to the lads' tastes, convey instruction or tend to increase a boy's intelligence, strengthen his memory, inspire him with self-confidence, make him patient or painstaking, or in some other way or ways help to form his character. And it must be remembered that all the time the boys are playing or working they are enjoying themselves heartily and healthily.

Bacon long ago declared play-acting to be 'one of the best means of educating children;' and apparently Sir Robert Baden-Powell, himself a clever actor, holds the same opinion, for in his volume, *Scouting for Boys*, he lays stress upon the advisability of encouraging in scouts the histrionic taste, and goes so far as to set down several simple plays eminently adapted to a caste composed of scouts. Another form of pastime that he recommends for winter evenings is debating; for, as he points out, practice in debating not only gives boys self-confidence and helps to dispel shyness and self-consciousness, but in addition it trains them to collect and concentrate their thoughts, also to argue and reason logically and rationally, while unconsciously they thus acquire general knowledge of the procedure at public meetings and in courts of law.

Whether this kind of training and secondary education is calculated to unsettle boys' minds by making them wish to live an outdoor life when in all probability they never will have an opportunity of living other than sedentary lives, it is as yet too soon to say. In some cases it may have that effect; but if, on the other hand, it should lead to more of our lads remaining in rural districts instead of settling in towns already overcrowded, future generations will benefit. In the same way, good will come if a large proportion of the lads of the rising generation, who in the ordinary course would go to swell the unwieldy population of Great Britain, are, through this novel course of training, induced to emigrate to our sparsely populated colonies. In parts of Canada, also to some extent in Australia, the idea is prevalent that an Englishman cannot or will not work, for which reason thousands of English —not Scottish or Irish—would-be settlers who are able and willing to work have been looked at askance in these colonies and refused the labour they sought. How the false impression spread the writer of this paper is in a position to state, having travelled extensively in the Dominion to inquire into the emigration question. The blame attaches solely to the body of people here in England who for years persisted in sending out to Canada their wastrel friends and relatives and turning them into 'remittance-men'—namely, men who depend for their means of subsistence upon remittances received periodically from home, and who won't attempt to work. The people of the colonies, to use the common American phrase, have 'no use' for such wasters. But now in Canada, Australia, and other of our colonies news has begun to spread that the system of secondary education introduced by the Boy Scout movement is going in the near future to create a race of young men of energy and determination, who will be equal to holding their own in any walk in life they may adopt either in the Old Country or its colonies. Already the Church Army and similar organisations have shown how quite poor lads can be trained expressly with a view to their settling abroad, and the prosperity now attending a great number of the men who as boys were sent out to our colonies and started in life by these philanthropic institutions may be held up in proof of the good work that has up to now been done in this direction. In such cases, however, the boy's career generally was carved out for him without his being seriously consulted one way or another. With Boy Scouts who may emigrate in the years to come the choice will be entirely theirs, and if they elect to settle abroad it will be owing chiefly to their having during their training grown to prefer a career in which they can themselves take the initiative. Nor can there be doubt that owing to the all-round training they will have received they will have little trouble in any colony in obtaining regular employment in the

event of their not being at first in a position to acquire land of their own.

A not unimportant fact which the scout movement is bringing home to the British boy is that lack of skill in playing cricket or football, indeed even lack of fondness for these games, does not necessarily constitute him a 'slacker' or a 'muff.' There are, for instance, hundreds of boys who at school are laughed at because they dislike cricket and football, and play it only under protest, yet who can row well, ride well, shoot well, and do plenty of other things needing fully as much skill, and calling for at least as much manliness, as are required for either football or cricket. Indeed, it would be interesting to see what would happen if some of the lads who are so ready to jeer at those among their schoolfellows who are not obsessed by a passionate devotion to these games were set astride the horses that plenty of the boys they deem to be 'muffs' and 'slackers' are able to sit with ease. It is to be regretted that even many schoolmasters consider a liking for football and cricket to be the only hall-mark of manliness in a boy. Now, at last, Sir Robert Baden-Powell has revealed to schoolmasters as well as to boys that there are pursuits in which lads who may know nothing of cricket or of football can none the less excel —pursuits needing manliness, perseverance, pluck, skill, quickness of decision, and far more intelligence in the player than cricket or football could call forth under even the most favourable conditions.

Another feature in boy scouting that constitutes a sign of the times is that boys who enrol as scouts have to undertake never to destroy life unnecessarily or cause needless suffering. Had such a rule been set for the observance of boys half a century ago, its framer would, if a civilian, have been held up to ridicule, while if a soldier had advanced such a proposal he would then and there have been pronounced to be of unsound mind. And in this connection the fact that the organiser of the scout movement is known to be a sportsman has given rise to the question, 'How, being fond of sport, can he consistently advocate the encouragement of strictly humanitarian principles amongst his scouts?' Probably, if the truth were known, it would be found that Sir Robert's views upon this question of sport and the destruction of life for amusement are, in common with the views of hundreds of modern sportsmen who at heart are serious thinkers, in a state of gradual transition. What proportion, for instance, of the men who to-day ride to hounds care in the least whether a fox that has shown good sport is killed in the end or not? In point of fact, if the vote were taken it would probably be found that the majority were in favour of a good fox being allowed to live to run again.

The next objection raised to the scout movement is that it encourages militarism, to which a vast section of the nation is opposed. Whether this section does right in condemning militarism need not be considered here. The statement may be made, however, without reservation, that the scout movement discourages militarism in every way it can. For the Boy Scouts are peace-scouts, and not war-scouts. All that they are taught, from the stalking and tracking of animals down to the ways of saving life and of rendering first-aid, comprises qualifications that are essential in the peace-scout. They receive instruction in self-defence and in the defence of their country, but not in the art of offence. No man who has witnessed the horrors of war once ever wants to witness them again; but all who have been in action are unanimous in declaring that the nation that values its safety and wants to avoid war in the future must above all else be prepared for war—'Be Prepared,' the motto of the scouts. In one respect only can the movement be rightfully charged with fostering the spirit of militarism. It does foster this spirit to the extent of enforcing discipline and obedience, the two cornerstones of successful militarism.

'Is any thought given to religion?' This inquiry has been made frequently of late, and owing to the impression having spread among a section of the clergy as well as among a body of the church-going community that the question of religion has been wholly 'shelved,' the movement is encountering mild opposition from a group of the Church party. Religion has been 'shelved' only in this way, that bigotry and prejudice are not tolerated in the ranks of the scouts. Lads of any creed or denomination may enrol, and in every case their tenets are respected. A firm believer in the dictum that Christianity alone is true religion, the founder of the scout movement is satisfied with the lads if they do their duty, fear God, serve King and country to the best of their ability whether as soldiers or civilians, are honourable in all their dealings, charitable, considerate, and straightforward. Sectarian religion does not appeal strongly to him, for he is too broad-minded to be swayed this way or that by any one particular doctrine. 'Let practical Christianity come first,' he remarked recently to the writer; 'sectarianism is a matter of individual opinion or personal conviction, and can follow later. Doctrine depends, after all, largely upon environment and upon what each lad has been brought up to believe.' Thus it is that no scout, being a Protestant, will think less of a companion if the latter be a Roman Catholic, and *vice versâ*, any more than a Churchman's son will take exception to the son of a chapel-goer, or a Protestant or a Catholic to a Jew or a Christian Scientist. To do so would be deemed bad form and irrational. All the boys are, however, expected to act up to the teachings of whatever particular creed they may belong to.

Whether the general knowledge acquired by boys enrolled as scouts is or is not of true educational value the reader will decide for himself from the list already given of subjects taught. The amount of learning acquired may not be great, and its standard may not be high, but the whole of it is practical, and no fraction of it is dull. That the

training, considered from every standpoint, must directly affect a boy's character, and so in after-life prove beneficial to him, few assuredly will gainsay. A distinguished mental specialist with whom the writer has the privilege of frequently conversing has declared emphatically that the movement is bound in the near future to lower our roll of suicides; for, in his opinion, a small proportion only of the men who take their lives are insane even temporarily. The rest commit the act through cowardice and lack of control. 'Little bravery,' he points out, 'is needed to pick up a pistol and pull the trigger if you don't wait to reflect upon what you are about to do.' More especially is the act that of a coward because the burden of which the suicide seeks to rid himself must necessarily be transferred to the shoulders of those to whom he was nearest and dearest.

It may be only natural, therefore, that under such conditions a scheme for the formation of a corps to be known as Girl Guides should already have been formulated. Some six thousand applications for enrolment have been received, and by the time these lines are published the code of rules for the Girl Guides will have been definitely drawn up. The intention of the organisers of the new movement is that the corps of Girl Guides shall be affiliated to the Boy Scouts. It will be interesting to see if this affiliation will ultimately lead to a development of the suggestion so warmly advocated by many earnest thinkers that boys and girls should be educated together. How widely this plan of educating the rising generation has been adopted in America, and how satisfactory it has proved up to the present, is well known. Indeed, when some years ago the writer visited the Leland Stanford University, in California, out of the twelve hundred students working there side by side no less than five hundred were girls or young women.

The steps to be taken to become a scout are simple. The boy, or whoever has charge of him, has only to make application in writing or personally at the scouts' headquarters in London; or the boy may directly join a patrol or troop raised by any gentleman in the neighbourhood of his home; or he may join one of the several other organisations for boys which include the Boy Scouts' scheme in their curriculum; or, with not less than five other boys of about his own age, he may form a patrol under the control of a senior boy or young man as patrol-leader. The age for joining is nominally between ten and eighteen, and boys between these ages may become patrol-leaders. Officers, called scoutmasters, must be over eighteen. It is well to remember, however, that red-tape is entirely taboo in the scout system, for which reason the exact ages are not strictly adhered to, and boys under ten are to be found enrolled among the scouts. The cost of joining is merely nominal, and there is no other compulsory expense of any kind. A hat, haversack, staff, and shoulder-knot constitute the compulsory uniform. The rest of the uniform is optional. When funds are required for any specific purpose the scouts set to work to earn them in one of the various ways that are explained to the lads in the course of their training. Thus the movement is self-supporting, and begging for subscriptions for any purpose is discountenanced. The spirit of cosmopolitanism becomes in a sense second nature to the Boy Scouts, and this has the effect of preventing the growth in their ranks of anything in the least resembling snobbery.

---

# LAURISTONS.

### CHAPTER XIV.—HOW CAPTAIN CHARLES TOLD THEM THE STORY OF DUNKIRK SANDS.

TO some of them that walk was to be a treasured memory as long as life lasted, though at the time it seemed but as the many that had gone before and as the many that might follow it. But the future lies beyond the thin, white, merciful veil which no man may lift by a hair's-breadth, and the present is past with one's thought of it, and so it is only the past that man may hold as a sure and certain possession. Thrice happy they who, by full right use of the moment, lay up certain treasure of happy memories, for these shall be their very own. And, sure, no crown of sorrows should such memories be, but rather healing balm for life's sharp wounds, and seeds of faith and hope that may take root again, and push through crust of heavy circumstance, and in God's good time bear flower and fruit once more in upper air.

Stoutly they climbed the hill on which the weathered gray church stood like a beacon, laughing and chattering with what breath they had, and flung themselves down at last on the top of the western slope, below the churchyard wall, and lay looking out over the wonder and beauty of the widespread landscape below.

'There's Windsor!' said Charles. 'I can almost see the flag.'

'Peep through the railings and you'll see the Princesses,' suggested his father; and Etienne, who was hardly yet accustomed to their flights, stared hard at the distant bump on the horizon, and cautiously at the speakers.

'Now, daddie, a story!' ordered Mavie—'a fighting story, and then we'll go down to Mother Goose's and have cherry-jam and cakes.'

Many a wild memory had Captain Charles of those final furious months of the war in America, and many the times he had held them spell-bound and breathless while he relived, and at times almost redied, them.

But this time, perhaps by reason of little John Sax being there, and because he had a great liking for the shy little lad, and mighty reason for doing him honour, he told them again the story of Dunkirk sands, and they hung on his words with fixed eyes and parted lips.

'My horse was down,' was the climax of the story, 'and I was struggling to get free of it, when the French lancers came down on us like a whirlwind. I thought of Mary—your mother, I mean—and you two little ones, and wondered quickly how you would all get on without me. I can see the long line of gleaming lance-heads joggling up and down, but all coming straight home, and the wild eyes and red nostrils of the horses, and the grim, tight faces above, and I knew that I must die there. And then—the lance that should have ended me drove into the body of a man who had flung himself suddenly in front of me; and before the Frenchman could withdraw it my sword had cleft his head right down to the chin. The rest swept on after our men, and I pulled the lance out of the body of the man who had given his life for mine, and took him in my arms and tried to stanch his wound. But he just smiled up at me and died. And that man was John Sax;' and Captain Charles put an arm round little Jack's neck and patted his shoulder gently.

'And we'll never forget it!' jerked Mavie, with a sob in her voice and a face full of tears.

And suddenly, without warning, she turned in her quick, impetuous way, and put her arms round John Sax's neck and kissed his burning cheek.

And little Jack, in the surprise of it, and the natural confusion of the moment, wiped off, with a surreptitious hand, a proud drop from his eye and Mavie's frank kiss. But he never forgot it.

'No,' said Captain Charles, in a voice that came from farther down than usual, 'we'll never forget it.'

---

### CHAPTER XV.—HOW MAVIE TOLD THE CHERRY-STONES.

'ND now,' said Mavie, when her feelings had had time to settle again, 'we'll go down to Mother Goose's and have cakes and cherry-jam.'

And down the hill they went, racing and laughing, for the emotions of childhood are short, if at times their memories are long. But Captain Charles and little John Sax went down somewhat more soberly than the others, I can imagine; certainly more soberly than Etienne, for he caught his foot in a tuft and rolled three-quarters of the way, to the tune of Mavie's delighted jeers.

Mother Goose, who dwelt at the sign of 'The Cherry-Tree,' was one of their institutions, and they never visited Harrow without a levy on her cupboards or her orchard, and a corresponding addition to the capacious pocket which she wore suspended somewhere among her very expansive petticoats. It would have needed a past-master in the art of pocket-picking to discover even the whereabouts of that pocket, and it taxed the old lady herself to lay her hands on it at times.

Mother Goose, according to Mavie, was an old dear, and Mavie knew. She lived in a dear little house embosomed in an orchard of the loveliest cherry-trees that ever were. She always wore a very large and spotlessly white mutch-cap on her head, and over her shoulders, pinned on her ample bosom by a massive gilt cameo-brooch displaying the chubby features of Queen Anne, a gaily-coloured silk handkerchief which grew more and more brilliant with every year that passed. So that each time they saw her she was more and more like a huge, soft old butterfly fluttering slowly about among her cherry-trees, every one of which she knew and loved and called by their own christened names. And here and there, on the outer edge of the orchard, were other dear little wooden houses where you could sit and eat cherries—and other fruits in their seasons, but especially cherries—all day long, if you were so minded and had the money and the natural capacity. And if, as now, you came before the fruits, you could sit in a glorious white world of cherry-blossom which now and again would come fluttering down in soft white showers, so that all above and all below was redolent of the beauty and fragrance of the cherry-trees.

Sitting there, you saw cherry, smelt cherry, felt cherry, and ate cherry in one form or another. For Mother Goose was always ready for all who came; and if they came, as now, out of season, there were still cherry-cakes and cherry-jam for the young folks, and even special mildly brandied cherries which were very delicious; and for the elders brandied cherries of a more substantial flavour, or—if their old stomachs could not stand the cherries—they could have the brandy alone and still get the flavour of them.

And since the reduction of the duty on tea Mother Goose had always been ready to brew a dish for any one who called for it. But, like the clever old financier she was, she had bricked up three windows in her little house, and for light knocked holes in the walls between the rooms. So that, when the King's gentlemen put down the tax on tea and put a tax on windows, the national Exchequer did not benefit materially by Mother Goose's contribution, for she could not rest till she had got the better of them.

She was a very old lady, for she was born in the reign of Queen Anne, and she had once seen the Duke of Marlborough, and King George the First twice, and expressed herself, on occasion, in anything but flattering terms concerning his personal appearance.

She welcomed our party with the large, motherly smile which was part of her stock-in-trade, and bustled away in front of them to the largest of the

little green wooden houses, with a duster in one hand and a clean white tablecloth in the other.

'And is it brandied cherries the little lady and the young gentlemen will have, or cherry-pizzervæ, with their cherry-cake? And will the gentleman have a dish of tea got ready, and some of the double-brandied cherries? No indeed, then, there is nothing like a cup of tea after a long walk.'

'Well, mademoiselle, give your orders!' said Captain Charles.

'Brandied cherries!' whispered Charles threateningly to the mistress of the feast, and dealt her an admonishing kick under the table.

'We'll have cherry-cakes for everybody, and cherry-pizzerve—all right, Charles, you needn't kick my leg off!—and brandied cherries for us, and double-brandied cherries for father, and tea for everybody,' announced Mavie regally.

'Bless your big little heart! You shall have the very best the house can give you, my dear! Last year's Annes and Sarahs was uncommon good, and I kep' a jar or two special for the daintiest little lady as should come. And the brandied Williams is the nuttiest ever was, and your papa shall have the double-brandied Jameses. They *have* a flaviour;' and she smacked her lips in anticipation of their enjoyment, and bustled away to prepare the feast, while the boys licked their lips hard because their mouths were watering so. And Captain Charles, after solemnly requesting mademoiselle's permission, lit a cigar and puffed the smoke up into the white firmament of cherry-blossom, through which the blue sky peeped in patches, with great enjoyment.

And presently the table was spread with bright array of twinkling little jars and bottles through which the plump little Annes and Sarahs and Williams and Jameses ogled the hungry youngsters seductively, and with golden brown cakes, out of which the fiery red-coats seemed to be bursting in their haste to see who could get eaten first.

'You boys can each have a Sarah III., and William I., II., and III. I'm going to have Anne VII. and William IV.,' said mademoiselle with decision.

'Bless her heart! Now, how did she know?' said Mother Goose admiringly.

'Anne VII. winked at me,' said Mavie solemnly, 'and William IV. I've had before, and I know they're sweet and juicy. I hope they don't mind being eaten; but those names on the bottles always make me think they've been alive and can feel.'

'Bless you, my love, they likes it! You'll hear them chirp and laugh when your little white teeth goes into them.' And so the feast proceeded merrily.

But all things come to an end, and there is a limit even to the capacity of youthful stomachs for cherry-cake and brandied cherries; and so, in due course, they were lolling replete and happy on the wooden seats in the little green house, unable to dispose of another crumb or suck another stone.

The boys showed signs of the pleasant lassitude which follows upon unusual accomplishment. Through the smoke of his cigar Captain Charles's eyes rested soothingly on the blue line of the distant Surrey hills towards which the sun was sinking.

Mavie alone was busy with her own devices. She was sitting on her hands, rocking gently to and fro, with nodding head and lips that muttered inaudible incantations. She was a firm believer in omens and white magic, and the necromantic arts in general, and in the prognostications of cherry-stones in particular. Her eyes passed slowly from plate to plate as her lips told the tale of the stones.

'Tinker—tailor—soldier—sailor—gentleman—lady—beggar man—thief!'—twice over. Then—'Tinker—tailor—SOLDIER! There, Charlie is all right!'

Charlie had thoughtfully seen to that little matter himself. He scoffed contemptuously at any belief in cherry-stone omens; but, all the same, it was as well to be on the safe side when the flick of a finger could manage it.

Another series of silent nods from Mavie, and John Sax stood indisputably labelled 'gentleman' by the record of the stones, and she counted them again to make quite sure.

Etienne by some inscrutable twist of fate came out 'beggar man.'

And she herself, in spite of all her efforts, was plainly destined to be a tailor.

Captain Charles's record was a short one.

'Oh daddie, do please eat one more,' she begged earnestly—'just one!'

'Why, then, minxie? I don't want any more.'

'But you can't stop there. Tinker—tailor—soldier—sailor—gentleman—lady—beggar man—THIEF! Do eat another one, daddie, or you'll make me mis'able! I'd ever so much sooner have you a tinker than a thief.'

'Oh, very well!' and he got out another cherry from James VII. 'But suppose this one too many makes me seriously ill?' he asked, holding it dubiously in the spoon.

'Oh, but it won't!' and Mavie watched eagerly for its disappearance and the righting of the record.

And then, to her dismay, he suddenly spat out the consummation of her hopes with a wry face.

'A grub in it, Mavie, upon my honour!' and he took a spoonful of the nutty brandy to take away the thought and taste of it.

'We'll count it, anyway,' said Mavie seriously, 'though you're not allowed to throw any of them away. I s'pose there was a stone in it?' she asked anxiously.

'I expect so, but I only got as far as the grub. I'm surprised at Mother Goose giving us grubs. James VII. sinks in my estimation.'

'That makes you a tinker—or half a tinker at all events. Charlie's a soldier. John Sax is a gentleman'——

'Hear, hear!' cried Captain Charles.

'Etienne's a—next door to a lady,' she said tactfully, as it struck her suddenly that, under the circumstances, his rightful appellation might be distasteful to him. But the other boys grinned.

'And I'm a tailor. I don't mind'—fiercely, as she caught sight of the smiling faces opposite. And then, suddenly spying stones under Charlie's seat, 'Charles Lauriston, I'm s'prised at you. You know it's not fair to throw stones away. You're a cheat!'

'Pooh!' said Charles scornfully, stamping the stones into the ground. 'It's better to make 'em come as you want 'em than to be so silly as to believe you'll be what they say.'

'Beggar man, I believe,' said Mavie when he removed his foot from the burial-place of the stones, and she was able to study the holes. 'And that's what you'll come to, no doubt, for your—your—du-plexity. I think boys are just horrid sometimes.'

'Never mind, Mavie,' said Captain Charles. 'There's something to be said for Charlie's view too. Come along and help me to settle up with Mother Goose, and then we must get home, if those boys can walk after all those cherries.'

Trifles, you say. But some of them never forgot that walk, and one of them never ate a cherry again without a pang at the heart like the thrust of a two-edged sword.

*(To be continued.)*

# THE MOA: A NEW ZEALAND PERPLEXITY.

By R. W. Reid, New Zealand.

NEW ZEALAND is troubled about its moa. Scientists and laymen are engaged debating many subtle questions touching that immense and mysterious bird. The discussion has been proceeding mainly in the Dominion newspapers; and if the facts produced have been few, slender, and shadowy, deductions and theorisings have been many, varied, and ingenious. Perhaps it may be well to state at the outset what is known with some degree of certainty respecting the moa. There are stories in plenty as to its great size and its uncanny habits. These, however, it may at once be confessed, belong largely to the category of things doubtful and debatable. The average Maori possesses a marvellously vivid imagination. Like the Japanese gentleman in the opera, he is not given to the recital of bald and uninteresting narratives.

Fortunately for the sake of sober science, the skeleton of another moa was put together not long ago in New Zealand. In October of 1908 a party of workmen, engaged in draining a swamp at a place rejoicing in the name of Sloven's Creek, in South Island, came upon a rich deposit of moa bones. From these the fairly complete skeleton was constructed. The bones conform with respect to size and state of preservation, and the present writer believes that most of them belonged to the one bird. And a bird of no mean proportions it must have been. From the ground to the head, with the neck arched, the height of the skeleton is seven feet six inches; the neck is five feet six inches in length, and the bones of the leg four feet six inches. White men who claim to possess particular knowledge of moas hold that the Sloven's Creek specimen, judging by the bones, was full-grown and perhaps aged. 'No,' reply the Maoris; 'that moa was small, not nearly full-grown.' The Maoris, you see, are always anxious to maintain the reputation of their country for things weird and wonderful.

The moa, according to my Maori friends, was dark brown in colour, and had an enormous beak; of wings it had none, and its legs were as thick as the thighs of a very big man. When standing erect it would measure, from beak to claws, a good deal more than twenty feet. The largest South African ostrich would be but a pigmy beside a full-grown moa—that is, if all I have heard in the *kaianga* and at the *pa* was in strict accordance with fact. The writer has never been able to say precisely where errors lay in Maori dissertations such as these. The colossal dimensions given may, however, be accepted in their entirety or subjected to reductions according to the ideas and tastes of the reader. Moas possessed many remarkable attributes—so say the Maoris. For example, they had 'cemeteries,' to which old and sick birds retired when they realised that their days were numbered; and, stranger still, they lived at times on wind—not the wind of hyperbole, but the real, refreshing breezes from the Pacific!

That the moa existed at some period in New Zealand, and in large numbers, has been amply demonstrated. Everybody is agreed that it was a gigantic and a fearsome bird. What remains to be settled to-day is the question, When did the moa become extinct? Here we find ourselves in a region of bewilderment. One scientific expert says with authority—all experts speak with authority—that the last moa died in New Zealand more than a thousand years ago. The writer has an impression that he has read somewhere of another scientific expert who placed the demise of the latest survivor so far back as the early days of the Christian era. But the thousand years will suffice for present purposes. Opposed to the thousand years theory are Maoris who seem to think that the bird is not yet extinct. Extremely interesting

letters have been written to the Dominion press, and from these contributions to the literature of the subject the writer takes the liberty of borrowing a few items. One correspondent, Mr H. C. Field, declares definitely that he has met Maoris who had seen and hunted the moa. When he went to live at Wanganui in 1858, he found whites and natives of opinion that stray moas were living in the larger forests and in the more isolated districts of the North Island.

Mr Field many years ago interviewed a number of Maoris respecting the moa. Apparently with confirmatory objects in view, he thoughtfully supplies the names of the principal men from whom he sought information. They included Te Marae, Kawana Paipai, Tamati Pana, Pehi Turoa, Aperahama Raniera Ngarangi; but time is limited and space is valuable. All the Maoris named—and a great many more—had hunted and had eaten the famous bird. As late as 1830 the moas seem to have been numerous, at all events near the west coast of North Island. Aperahama remembered seeing a grand and ever-to-be-remembered fight between two moas. It appears to have been a well-contested encounter. The birds, said Aperahama, did not jump at each other and tumble about as do combative roosters; they stood firmly on one leg, and with the other dealt each other terrific blows. This unique mode of giving battle, somehow, strongly appealed to the imagination of the Maori. In the earlier days the moas lived in the bush, perhaps more in the scrubby outskirts than in the dense forest, and they were strict vegetarians.

Mr Field, in the course of his investigations, further learned that about the year 1830 a Taupo chief, bearing the euphonious name of Te Heu Heu, gave a great feast at his *pa* near Tokaanu, and that the flesh of a moa on that occasion was cooked for the delectation of his many guests. A Maori who joined in the festivities said that the bird's skin was as large as the hide of a huge bullock. Maoris in the olden days, Mr Field was told, tamed the moas and kept them as pets. There is, he states, in the Wanganui Museum the skeleton of a small moa. Not only are all the bones perfect, but in addition it possesses the horny tracheal rings of the windpipe. These, it is argued, would not have been in existence had the bird been long dead. Again, some one is responsible for the information that a moa chick was captured near Moawhango in 1865. What the subsequent career of that forlorn chick was nobody in New Zealand can tell. Such are some of the facts adduced by the defenders of the recent-extinction or still-surviving theory—a theory which appears to find most favour in the North Island.

In the South Island a correspondent, who is described as 'a member of the Ngai Tahu tribe,' made a brave effort to secure the annihilation of the North Island theory. No less an authority than Sir Julius von Haast—a name which commands respect in New Zealand—once wrote an article entitled 'The Moa and Moa-Hunters,' in which he contended that the Maoris were not the moa-hunters, but that those hunters belonged to a prehistoric race which occupied the country long before the advent of the Maoris. The member of the Ngai Tahu tribe confesses that he considered that the contention of Sir Julius von Haast was not sufficiently based on truth—and people say the Maoris are not progressing!—and for that reason he examined many Maoris to enable him to decide what, with regard to moas, was fact and what was fiction. Of all the aged Maoris he met he inquired if they or their forefathers had ever seen a moa. Every answer he obtained was to the same effect: the moa had never been seen by the Ngai Tahu, by the Ngati Maamoe, or by the Waitaha tribes. It was doubtful, said the veterans of the *pa*, whether even the Haweas had seen the moa. The full significance of those averments may seem somewhat obscure to readers at home; there are people in New Zealand to whom also they are not too clear. In Maori eyes the reference to the Haweas appears to be conclusive evidence. It is satisfactory, however, to relate that the member of the Ngai Tahu tribe now considers it safe to abide by the teachings of Sir Julius von Haast.

One correspondent, who claims to have a good memory, contributes to the discussion the intelligence that 'the late Mr Alexander Murray, of Day's Bay, Wellington, heard the roar of the moa early in the 'forties, as, some years later, did the late Major Lockett at Collingwood.' 'This roaring of the moa must have been but a mere figment of the brain,' retorts a rather sarcastic letter-writer. He puts the pertinent query, 'If the roar of the moa was listened to near Wellington in the 'forties, why did the Maoris, who occupied all that district, never hear it?' The correspondent with the good memory, taking for granted that these Maoris never heard the moa exercising its voice, has not yet returned to the charge. Another occasion has likewise been alluded to when a moa—in a manner not stated—made its presence known. 'A boy,' it is alleged, 'was frightened by such a bird at Mangatipona, in the Wangaehu Valley, soon after Beard took up the sheep-run there.' But as the writer never before heard of the places mentioned, has asked no questions as to their precise location, and does not know when Beard took up the sheep-run, he is afraid that the information will fail to provide much additional enlightenment. However, like the 'cemetery' and the 'wind-eating'—the only 'peculiarities' of the moa the writer has had sufficient courage to mention—the story of the frightened boy is given with hesitation, and must be taken for just what it is worth. Meantime there is much to learn about the moa. The weight of evidence seems to be on the side of extinction; but the query remains unanswered, When did the last moa die?

# AN 'INDIFFERENT' CHARACTER.

By P. L. OLIPHANT.

PART I.

CAPTAIN JACK CUTHBERT flung himself down on the ground before the dying embers of the camp-fire.

'They 're all fairly fagged out to-night!' he exclaimed to his subaltern, who was superintending the cooking of a supper of rice and goat's flesh over the glowing faggots. 'There 's not a kick left in 'em. If it hadn't been for Clements they 'd have got no dinner. He arranged the bivouac and set the fires going whilst the cooks and the quartermaster-sergeant were sleeping like hogs under the trees.'

'Clements is a ripper!' said Dering laconically, stirring the mess in the pot.

'The very best, on service,' his captain agreed. 'The pity is he can't keep straight in barracks. He 's worth all the non-commissioned officers in the company when it comes to a pinch. Isn't that stuff about ready? I 'm famished.'

Dering took the pot off the fire and ladled out the contents into two enamelled-iron soup-plates.

'It 's not exactly "Savoy" form,' he said apologetically; 'but we 'll call it *filet de chêvre à la Irawaddy*, and here 's a *chupatty* to help it down;' and he handed him a round of unleavened dough which had been baking on a flat stone in the midst of the ashes.

For some minutes they ate in silence, as men will eat who have tasted nothing from dawn to the setting of the sun, and have herded eighty men on as many ponies, to say nothing of the transport, for five-and-forty miles through the swamps and jungles of Upper Burma.

The Burma war was over — officially. King Theebaw was a prisoner; the Burmese army had laid down its arms at Ava; to all intents and purposes Burma was already part of the British Indian Empire; but the business of the British regiments in the country was only just beginning. The defeated Burmese army melted away, and in its place sprang up bands of Dacoits led by enterprising Bohs, who terrorised the country and bid defiance to the conquerors. It was impossible to say who were peaceful inhabitants and who were not. The villages succumbed to the Dacoits or to British rule indifferently. The first in the field gained their allegiance, only to be thrown over in favour of the other when circumstances rendered a change of policy advisable. The only recourse was to capture the Bohs, and thus effectually put an end to their influence. To this end the British force was broken up into companies of infantry, mounted on the sturdy little ponies of the country, and despatched in pursuit of the various Bohs; and, as an inducement to speedy operations, rewards were set on the heads of the more mischievous members of the Boh fraternity.

Cuthbert and Dering, with their company of eighty mounted infantry, had been in pursuit of Boh Choung for six months. They had hunted him from village to village, through the dense jungles, over hill and vale; by forced marches they had endeavoured to overtake him; by ruses they had sought to trap him; by threats and promises they had striven to outwit him with the inhabitants of the country. But Boh Choung was elusive. His trail through the jungle was blazed by crucified Burmans who might have given information to his pursuers if they had been allowed to live. The villages welcomed him and his Dacoits with open arms, and passed them on as speedily as possible to their neighbours in time to obliterate all traces of their visit before the arrival of their pursuers. When Cuthbert and his company arrived, the villagers never knew anything about Boh Choung — they had never even heard of him! They were peaceful people, longing for the strong rule of the British; and the arms which were concealed beneath the floors of their picturesque habitations were, of course, kept solely for defence against the pestilent Dacoits. Time and again Cuthbert had been at the very heels of Boh Choung. He had skirmished with the Dacoit rear-guard; he had even captured two of their old bronze *jingals*, which had hurled chunks of iron and stones at his company at intervals throughout the entire rainy season. But Boh Choung and the five thousand rupees upon his head were as far off as ever.

The meal was over in a few minutes, and Cuthbert and Dering filled their pipes, whilst the soldier-servants, who had been making a bivouac for the officers of bamboo saplings covered with teak-leaves, removed the enamelled plates and cutlery. The sun was down, and already the chill night-air crept upon them, laden with the germs of fever and malaria. Dering shivered and stood up.

'I 'll go round the pickets,' he said, drawing up the buckle of his Sam Browne belt. 'Have you any special orders?'

'Tell Rogers to send out a patrol along the river-bank. They might fall in with a native. We can do nothing without information. Friend Choung may have crossed the river, or he may have held on to the village on this side. A patrol might be able to pick up his tracks. If not, I 'll send you out with a reconnoitring party to-morrow morning.'

The bivouac was unusually silent. Men and ponies, exhausted by the long march, had fallen asleep as soon as the cravings of hunger were appeased. Only at the outpost picket, a quarter of a mile

away on the rising ground overlooking the Irawaddy, was there any sign of life. Corporal Rogers, in command of the picket, was relieving his sentries when Dering visited the post. He accompanied the relief, pointing out to the new sentries the extent of ground they were to watch, and giving them instructions to make prisoners of any inhabitants who chanced to approach the line.

'You know what you are here for,' he said to the corporal—'security and information; and it is information we want most just at present. If your sentries don't get hold of any one, you must send out a patrol along the river-bank.'

The corporal saluted, and Dering turned back towards the bivouac. It was the same old story, he reflected bitterly—the hot scent, the rapid dash across country in pursuit, and at the end an empty village or the lost trail. He was beginning to be sick of it, and he was conscious that the men were sick of it too. If Boh Choung and his Dacoits would only put up a respectable fight now and then, they would have been willing to overlook his elusiveness. But Boh Choung never fought if he could possibly run away without a shot being fired. It was only when he was cornered that he showed fight, and then the angle always fell out of the corner and the Boh slipped through.

As Dering neared the bivouac and the picket-lines of tired ponies, he suddenly became aware that some one was approaching him in the darkness. He loosened his revolver and waited; and then, as two figures emerged from the trees on his right, he challenged and called to them to halt.

'It's Sergeant Clements, sir, with a prisoner,' came the answer.

Dering went to meet them, and the sergeant explained, 'Seeing that all the company was asleep, sir, and nothing doing, I thought I might as well take a turn outside the lines. I hadn't gone five hundred yards before I came across this'—he pushed the reluctant Burman forward for the inspection of the officer. 'He was skulking about in the trees, and I'm certain he was up to no good; so I just laid hold of him and brought him to camp.'

Now it is one thing to capture a prisoner, but quite a different matter to extract information from him. The reticence of the Burmans was remarkable. The terror of the Bohs was over them, and nothing would induce them to give information of the whereabouts of the Dacoits, though they suffered severely from their raids. When a prisoner was brought in he was questioned by Cuthbert, the native apothecary from Rangoon—the sole medical attendant of the company—acting as interpreter. When Cuthbert failed to extract information from him, the prisoner was handed over to the persuasive measures of the sergeants' mess; and finally, before he was dismissed, one or two of the old soldiers of the company would try their hands upon him. Altogether it was not a pleasant experience for a Burman to fall into the hands of that particular company of mounted infantry, and they generally managed to avoid it.

Cuthbert was asleep when Dering returned with Clements and the prisoner, and the native apothecary was asleep too. So Dering told the sergeant to take the prisoner away, and to find out what he could from him before midnight, when the captain always went the rounds of the picket and would be able to judge for himself the value of the prisoner's information.

Nobody knew what passed between Sergeant Clements and his prisoner during the three hours that they spent in each other's company, nor did the absence of an interpreter appear to embarrass the flow of ideas between them. The British soldier is a wonderful linguist in his own peculiar way; it is dangerous to misunderstand him, and worse than folly to be unintelligible to him. At midnight Sergeant Clements reported himself, with his prisoner, outside the captain's shelter, with information of such importance that the whole company was in the saddle before dawn, with the prisoner, mounted on a spare baggage-pony and in leading-strings, between Sergeant Clements and an old soldier of his section.

If that prisoner was worthy of belief, there was a stockaded village within a dozen miles of the bivouac, and behind the stockade was Boh Choung with his merry men. The leading-strings and the muzzle of the sergeant's Martini tilted suggestively in the prisoner's direction were not necessarily for use, but simply as a guarantee of good faith.

Cuthbert and Dering rode at the head of the column, and extolled for the hundredth time the energy and excellence of Sergeant Clements; and for the hundredth time Cuthbert regretted that the enervating influence of the barrack-square should always prove fatal to the disciplinary rectitude of so fine a man.

'If ever we get out of this cursed country and back to the cantonments of an Indian station I know what it will be,' he said mournfully—'Clements will be broke within a month. He would have been sergeant-major years ago if he could only have kept straight. Sweat him from morning to night, and he is the best non-commissioned officer that ever stepped; give him an easy billet, and he'll make a fool of himself inside a week.'

Then he went on to recount the numerous acts of folly which had resulted in the several degradations of Sergeant Clements, and the signal services for which he had been restored step by step to favour.

'He's never slack, and he's never a blackguard; but feminine influence and fermented liquor are too much for him at times. Not constantly, by any means; but every now and then a break-out and a break-down, and Sergeant Clements reverts to private until he makes himself indispensable again.'

Boh Choung was in waiting for them a few miles farther on. He had laid an ambush, which the advance-guard of the mounted infantry had passed

unnoticed, and his Dacoits opened fire from the cover of the rank grass thirty yards from the head of the column. The bullets kicked up the ground in front and whirred overhead, and one or two found a lodgment in the ponies of the leading sections. There was a momentary confusion, and then Cuthbert turned round, laughing, to the men behind him.

'How badly the beggars shoot!' he exclaimed coolly. Then the men of the leading sections laughed too; and in a trice they were dismounted and skirmishing in admirable order through the jungle, driving the unseen enemy before them.

Sergeant Clements looked ruefully at his prisoner. 'So that was your little game, was it?' he asked, unslinging his rifle. The Burman, ignorant of the charge which was brought against him, but well understanding the meaning of the sergeant's action, fell forward on his pony's neck, imploring mercy. Clements pulled down the lever and slipped a cartridge into the chamber. He was anxious to have done with his prisoner and to join in the pursuit of the retreating Dacoits.

'Get the beggar off, Ambridge,' he said to the man who was assisting as escort.

Ambridge stooped down, and taking the Burman by the leg, tipped him off, and he fell, still clinging round his pony's neck.

'Sergeant Clements!' It was the captain calling.

'Just you look after him until I come back,' Clements said, turning to answer the summons.

The captain had orders for Clements. The Dacoits had retreated behind a high stockade, which evidently surrounded a village. Sergeant Clements, with his section, was to make a detour round the stockade to see if there were a gap where an entrance could be effected.

'What about the prisoner, sir?' Clements asked when he had received his orders. 'Shall I shoot him?'

'Shoot him! Why? He has brought us up with Boh Choung.'

'But the ambush, sir? He must have known of that.'

'We will give him the benefit of the doubt. Leave Ambridge in charge of him, and take the rest of your section round the stockade.'

Now, a stockade ten feet high, loopholed for rifle-fire, and constructed of solid timber balks, is a serious obstacle to infantry unsupported by artillery. You may charge up to it valiantly; but you can't do much good when you get there, and it is more than probable that you will incur a great deal of damage. So Jack Cuthbert held three sections of his company in extended order, lying opposite to one side of the stockade, whilst Sergeant Clements with the fourth section rode round to find the weak point in the enemy's defences. Meanwhile a brisk fire was kept up on both sides, which was rendered more impressive by the loud explosions of half-a-dozen *jingals* loaded with stones from behind the stockade.

Sergeant Clements had not gone more than half-way round the fortified village before he discovered a weak spot in the defences. The stockade sank to about eight feet in height, and the loopholes were but feebly defended. Without waiting for reinforcements, Clements assaulted, and in a few minutes found himself and three of his men within the village, cut off from the rest of his section. The Dacoits defending that portion of the stockade beat a hasty retreat on the entrance of the sergeant and his three followers. On the other side a tremendous fusillade was being kept up against the main body of the company, so that Clements found himself and his little party practically unopposed.

In the middle of the village was an important-looking structure with a pagoda; it might be a palace or it might be simply a temple. But, whatever it was, it attracted Sergeant Clements's attention as he looked hurriedly around him; and without further delay he started towards it, followed by the three men who, alone of all his section, had succeeded in scaling the stockade. They reached the building unopposed, and the sergeant drove in the door with the butt of his rifle and entered. He found himself in a large apartment, decorated with heavy carved pillars, in which were about a dozen men. They were armed with swords and antiquated firearms, and in their midst was a middle-aged man, whose distinctive dress and the deference showed to him proclaimed him the leader of the party. Clements's sharp wit jumped at once to the conclusion that he was in the presence of Boh Choung and his 'general staff.' He dropped on his knee and covered the Boh with his rifle.

'You three keep the door,' he said, with his eye along the sights. 'The captain and the rest of 'em will be here directly.'

The men posted themselves at the entrance, and Clements remained alone in the great room, still covering the Dacoit leader with his rifle. Not one of the Dacoits stirred; they stood helplessly round the Boh, gazing at the tiny muzzle of the sergeant's rifle as though it possessed an irresistible attraction for them. And there, for a quarter of an hour, he held them all at bay until word was carried to Cuthbert that an entrance had been effected, and half the company came tumbling over the stockade to finish the work which Clements and his three men had begun.

With the capture of Boh Choung the troubles of Captain Cuthbert's company of mounted infantry came to an end. They rejoined the headquarters of their battalion at Mandalay, and drew the five thousand rupees which the Government had assigned for the capture of the rebel leader. Of course neither Cuthbert nor Dering touched an anna of the reward, which was divided amongst the non-commissioned officers and men, and Sergeant Clements's share of it amounted to two hundred and fifty rupees.

Then they returned to India to be quartered in a quiet little up-country station, where they could get

rid of campaigning kit and customs and settle down into a respectable unit of British infantry once more; and in due course the medal for Distinguished Conduct in the Field was presented to Sergeant Clements by the General Officer Commanding at a parade of the whole garrison, and he was held up as a shining example of soldierly qualities and intrepid coolness. Then, within a month, he was tried by court-martial and reduced to the ranks for absence without leave.

When the sergeant's stripes were off his arm, and the full significance of his degradation was borne in upon him, he sought out his captain in the seclusion of his bungalow. 'I think it's about time I retired from the service,' he said diffidently. 'My twelve years are up, and I'd thank you, sir, to get me my discharge.'

'Look here, Clements,' said Cuthbert, pushing a chair towards his old sergeant; 'take a seat and let's talk it over.'

Clements sat down on the edge of the chair, fumbling uneasily with his helmet. 'There's only myself, sir, to blame, I know,' he muttered. 'I knew better, and I ought to have acted according.'

'Never mind the past—that's paid for; I want to talk to you about the future,' said Cuthbert. 'You're a young man yet—younger that I am, and there's a future before you in the army if you will be sensible. You will be a sergeant again in a couple of years if you keep straight, and then in another five or six you can retire on a pension.'

Clements shook his head. 'There's too many "ifs" about it, sir, asking your pardon,' he said. 'I'd rather go now.'

'But what will you do when you get home?'

'I expect I'll find something to do, sir.'

'But it's not so easy. And then your discharge will stand in your way. The colonel can't give you a good character just at present. You know the rules as well as I do.'

'I've got friends at home, sir, who will help me.'

'And you have got friends out here too, Clements—friends who know you better than your people at home. You had better stay with us.'

But Clements had made up his mind, and was not to be dissuaded from it. All the arguments of his captain availed nothing, and when the trooping season came round Private Clements took his discharge and sailed for England.

---

PART II.

YEAR later Jack Cuthbert went home on leave. He had not seen England for five years, and he was filled with the emotions which home and country awake even in the dullest breast as the P. & O. steamed slowly up the river to the India Dock. Behind the veil of mist and smoke ahead lay the great enchanted city whose voice goes out to the uttermost parts of the earth, calling her sons back to her. He was returning; and the East, with all its gorgeous colours and all its glowing life, was forgotten.

The ship came alongside the quay, and the business of disembarking the passengers and their baggage began. A crowd of seedy-looking fellows surged in upon handbags and portmanteaus as they were put ashore, and bore them off to the Custom-House in the expectation of earning a shilling or two for their services. One of them plucked at Cuthbert's sleeve.

'Is this your bag, sir?'

Cuthbert started and looked round; the voice was strangely familiar. It carried him back eight thousand miles, to the swamps of the Irawaddy.

'Yes,' he answered mechanically.

'Anything else, sir?'

'Yes, Sergeant Clements, there are a lot more.'

The porter dropped the bag, stood to 'attention,' and saluted. 'Beg pardon, sir. I didn't see it was you, Captain Cuthbert.'

Cuthbert glanced at him hurriedly. He knew that Clements would not thank him for too close an inspection, for he looked half-starved and out-at-elbows. There was a hump on his shoulder, where the long planks from the Baltic shipping had brought the muscles up into a knot; his feet were bulging out of the sides of his boots, and there was a ten days' growth of beard on his chin.

'Never mind the kit. I want to have a talk with you,' said Cuthbert. He led the way to a low parapet guarding the edge of the basin and sat down upon it, out of hearing of the crowd of passengers and porters.

'Now tell me all about it,' Cuthbert demanded.

At first Clements demurred; but finally, with an outburst of confidence, he told his tale. 'I ought to have taken your advice, sir, and stopped with the regiment,' he said dismally; 'but I couldn't bear the shame of it after all the general said to me on parade. If it hadn't been for the Distinguished Conduct Medal, I'd have stayed and worked my way up again; but I couldn't face it.'

He paused, and Cuthbert threw in a question as to his doings since he had come home.

'What with my deferred pay and what was left of the reward for collaring Boh Choung, I had over fifty pounds when I got home. I thought it was a fortune, and that I was going to start in a business of my own. Then I got among friends—and it was all gone in a fortnight. After that I started to look for work. My friends couldn't help me to find that, though they had been ready enough to help me through my bit of money. I tried the agencies which lay themselves out to find employment for old soldiers; but the first thing they asked for was my discharge documents, and when they saw the word "Indifferent" against my character they told me straight that they couldn't hold out much hope of getting me a situation. After a bit I stowed away my papers, as they only seemed to stand in my way, and passed myself off as a

civilian; but of course I had no references to give, and I couldn't get steady employment. I got a job at last at the Surrey Dock as a stevedore. It's left its mark on me, as you can see, sir'—he laid his hand on the hump on his shoulder; 'that would take a drill-sergeant three months to work off. But I stuck to it for six months, and should have stuck to it for good, I suppose, only there was a slump in the timber trade, and half of us were turned off. Since then I've been trying all the docks in hopes of employment, but I can only get odd jobs.'

'Are you married?' Cuthbert asked.

'No; thank God, sir, I have only myself to provide for.'

'Look here,' said Cuthbert after a pause, 'will you come with me? I'll undertake to find you work if you will give me your word to stick to it.'

The man's face lit up with something of the old spirit, and he drew himself straight as he answered simply, 'Thank you, sir; I'll do my best to deserve your kindness.'

'Then you will have to start as my personal servant until I can make other arrangements. Go and collect my baggage and take it to the Custom-House.'

A few days later Cuthbert, with his new servant, arrived at his father's house in Warwickshire. They had both spent the interval in fitting themselves out for polite society in England, for which the fashions neither of Upper Bengal nor of the Mile End Road are appropriate.

Mr Cuthbert, senior, was a man of business and of influence—a director of extensive ironworks, a Justice of the Peace, and the proprietor of a considerable estate in the county. Jack Cuthbert waited until the fatted calf had been duly disposed of, and the aroma of tobacco wafted perfect peace and contentment to the soul of his respected parent. Then he laid the case of ex-Sergeant Clements before him.

'You see, dad,' he explained, 'I don't want the expense of a servant whilst I am at home, and in a year I shall be going back to India, and I can't take him with me. If you can find him a billet, I'll undertake to say you won't regret it. Give him a job which requires a head as well as a good pair of hands; and sweat him—sweat him hard! He is a beggar who thrives upon sixteen hours' work a day.'

Mr Cuthbert was not in a mood to refuse his son anything, and the fact that his protégé had materially contributed to his boy's success in capturing Boh Choung—a source of vast paternal pride—made it impossible for him not to accede to his request.

So ex-Sergeant Clements took up his duties in the ironfoundry at Birmingham, in a position unaffected by the restraints of trade-unionism and with freedom to work from dawn to eve. When Jack Cuthbert returned home again four years later, he found his old sergeant at the head of his department, and regarded by his employers as quite indispensable.

---

## MACHINERY IN MOROCCO.

THE Moor cuts a shallow furrow with his wooden plough and slowly moving team of oxen, trusting to a rich soil, a seldom-failing rainfall, and brilliant sunshine to mature the seed which he sows. He has secrets of tanning in yellow and in red. He can dye in fast colours and weave a carpet which is well-nigh everlasting. He can work cunningly in hammered copper, and can produce pottery. Tiles glazed in blue-and-white, with ornament in stucco, still form part of his decorative art, descendant as he is of Alhambra builders. It is his deft hand which aids him in these industries, and his muscular arm which supplies the motive-power to grind his corn, thresh his wheat, and spin wool and weave it into cloth. He knows no need of machinery.

Who that has toiled up the steep streets of Tangier has ever once sighed for a wheeled vehicle or wished that his means of locomotion were other than the willing feet of his donkey or his mule? One is safe to answer, 'No one;' for the visitor, in crossing the Strait of Gibraltar and entering Morocco, feels that he has slipped back through six centuries of time. He hardly expects to hear the whir of machinery.

Yet even Morocco begins to feel the effects of an age of steel. Here and there, on its borders which come into closest touch with a progressive world outside, mills begin to be turned by engines in place of mules, and Tangier has had its electric-lighting station these many years.

Needless to say, these evidences of the twentieth century are due to European influence, for it will be remembered that too keen an interest shown by the deposed Sultan Abd-el-Aziz in cameras and motor-cars helped to hurry him into obscurity. His successor, Moulai-el-Hafid, though believed to be at heart in favour of progression, outwardly keeps faithful to established tradition. For the Moor resents the touch of the iron finger. The Casablanca incident is still fresh in his memory. In 1907 some natives of that town took exception to the light railway which was built to transport sand and building material required for the harbour works at the port. Several Europeans were killed, and this gave the French the excuse to bombard the town. Again, the irritant in the recent rising

among the Riffians, a rising which has cost Spain dear, was a railway projected by a Spanish company, and partly completed, between Melilla and the mines of Beni-Bou Ifrouk, eighteen miles towards the interior.

In the spring of last year the Compañia Transatlantica, which owns the electric-lighting station in Tangier, purchased a gas-engine of one hundred and thirty horse-power. This engine was arranged to manufacture gas as the town required it, and worked for this purpose in conjunction with a gas-generating plant. The engine was made in Britain, and was substantial in character. For example, it required a fly-wheel weighing twelve tons, while the bed and cylinder weighed over ten tons. These were unwieldy and heavy pieces to handle when they arrived on the Morocco coast, where jetties are non-existent and cranes may be things of the future. One does not expect a jetty in Morocco; to land in pounding Atlantic surf in a boat which has dodged the waves where they broke is usual at the coast-towns. Although in Tangier better conditions exist, yet Borrow's description of his landing, in his *Bible in Spain*, is still substantially applicable. A jetty there is, but it has no equipment of cranes, and is only used for passengers embarking and disembarking by means of small boats.

The engine-parts were lowered from the ship's side on to lighters, and these were run as far up the beach as a high tide would permit. Then, when the sea receded, the fly-wheel was dragged on rollers and planks over the stretch of wet sand. Long before the parts were hauled high and dry the returning tide surrounded the wheel and heaped sand over it, so that before operations could be again begun at slack-tide the wheel had literally to be dug out. Slowly and painfully, with the aid of a band of twenty Moors pulling on rope-blocks, all the material was safely dragged beyond the reach of the waves. The confusion of packing-cases, cylinders, cooling-towers, and tanks lying on the beach formed a novel playground for tiny Moorish boys. They crawled into the cylinders and played what corresponds to 'hide-and-seek' with their fellows.

Finally, it was necessary to transport this material from the beach to the central electric-lighting station, where the foundations for the new plant had been already laid. A quarter of a mile of zigzag street had to be covered, three yards wide and paved with cobble stones, on the prevailing incline of the streets of Tangier. Again the only means to accomplish this was the muscle of the Moors and the factor of time. A band of twenty Moors, harnessed to the fall of a set of rope-blocks, hauled and invoked Allah, till after three long weeks the various parts reached the site of the installation.

So much for the difficulties of transport; but there were other ways in which trouble was met with. Hostility to innovation is deeply rooted in the patriotic Moor. On one occasion it was desired to run a pipe from a pump under the sand of the beach to a point out at sea where cold sea-water could be taken to cool the engine-parts. This work was vetoed till the consent of the Governor could be obtained. The Governor, in the hope of extracting a present from the promoters of the lighting installation, prevented the placing of a set of poles to carry the current-conductors to the houses of the consumers. Then, to crown all, when the installation was complete, the working of the plant was completely prohibited because the engine exploded rather noisily upon occasions, and the users of electric light must have had to betake themselves to their old-time rushlights.

Not always has it happened that the advent of the labour-saving device has been looked on with disfavour in Morocco. The town of Saffi has an oil-engine, and it may be called a popular institution. Saffi has a population of some six thousand inhabitants. It is a coast-town on the Atlantic seaboard, and lies, surrounded by crumbling walls and sheltered from land-winds, at the base of rugged cliffs. Inward stretches the trail to Marrakesh, two days' journey distant. This region is fertile, and its crops find their way to the sea for export through Saffi, so that the market-place or *soko* of that town is usually a busy one.

On the day of our visit an edict had just been issued by the Sultan that the Governor of the district should collect taxes. The Moor seldom has ready-money; but he has in his fields, stored in bottle-shaped cisterns, the crops which he has raised during perhaps the last two seasons. These he hastens to convert into money to pay his dues, for he knows that the edict will shortly be followed by an army to be quartered in the neighbourhood to enforce payment from the reluctant. Strings of laden camels are heading for Saffi from the country round. On the back of each is a balanced load, a double-ended sack bulging with wheat, and arranged pannier fashion. The narrow, cobble-paved streets, lined with booths, are choked with a double line of camels, mules, and donkeys, with their riders and drivers, the loaded making for the market-place, the unloaded going in the opposite direction. Let us thread our way between the steady stream of swaying, grunting camels and the booths which line the main street towards the *soko*. Arrived there, we look on a varied scene of movement. The square is six hundred yards long and about half that breadth. It is packed with moving beasts and men, yet there is room here and there for the packing-cases turned on end which serve as shops. Our interest centres round the unloading of the camels. With many complaints they have knelt down, and their drivers have deftly slit open the ends of the bulging sacks which the camels carry suspended on their backs. From both sides, falling over the camel's flanks in a golden shower, falls the grain; the animal is then coaxed to rise and stand till the last grain has trickled to the heap surrounding it. Then the unloaded camel gives place to the one that follows, till mountains of grain grow up before the eyes in

various corners of the market-place. In another part of the *soko* a merchant has bought a heap of grain. He has bought it as it lies on the ground, but will only pay for the number of quintals which the heap contains after he has winnowed it. A modern hand-turned winnowing-machine of British make swallows up the heap, full as it is of small stones, dust, and *débris* of the market-place, and gives it out again clean and measurable. At still another part of the market-place sits a row of veiled women. In front of them, stacked in piles on a board raised slightly from the ground, are the round, flat loaves of the country. There are two varieties—one coarse and baked of meal, the other lighter in colour but also coarse in texture. Round this group of silent, draped figures crowd the camel-drivers, who pick up from the piles a loaf, or tear one in half, leaving a *billon* or two in exchange.

Let us examine this bread and if possible find out where the flour of which it has been composed has been ground. We find it gritty. The stones are evidently native, and perhaps cut from those very cliffs which guard the seashore. We go to the one mill in Saffi to inquire. There we find a modern oil-engine; and it is perhaps natural that its owner, who has lately acquired it from Britain, is unable to make it go. He is a Gibraltarian, a Mr B. He explains that Mohammed's birthday and the Jews' Passover feasts are on the eve of being observed. He is losing custom, while the native mills, querns for the most part, are reaping a harvest. For milling a quintal (one hundredweight approximately) the owners of these mills are receiving one dollar (*hassani*). This is equivalent to four shillings at par value of the dollar, but to-day the exchange puts the dollar at a value of two shillings and sixpence.

We remember the grit which we had detected in the loaf during our walk, and we imagine that we now have an explanation of its presence. Probably the meal to make that loaf had been ground in a quern. It is our business to help Mr B. to start his engine. It is in perfect adjustment, except that he has screwed the admission-valve to the carburettor or vaporiser too tightly to its seat, and no charge is entering the engine. Soon the engine is exploding merrily, and great is the wonder of the community in Saffi. However, their wonder is changed to pleasure when a crier goes through the streets shouting, 'The engine now works. Bring your corn;' and at the same time the price for grinding a quintal is lowered from one dollar to three *pesetas* (*hassani*). We watch with interest the laden mules beginning to arrive. Rich men bring their grain in camel-loads; but there are those who have only a modest half-sackful. All are eager to be first, and we are besieged by men and women asking us to use our influence with the miller. One of these is the cook at the Saffi Hotel (named such, but it is only a name). She claims our aid, else we shall have no bread to eat; but yet the two millstones cannot grind one whit faster than they are doing. The crowd must chafe and even be locked out of the mill premises till such time as the first-comers have been served.

In the evening we stroll out of the town-gates, guarded by antiquated cannon, up the hill which looks down on Saffi. We enter the tiny cemetery which occupies the crest of the slope, and sit down on a tombstone. The sun is setting on the Atlantic, and we look down on the square of the city wall which encircles Saffi; on flat-roofed, white-walled houses, far enough distant to appear pure white; on narrow streets teeming with swarthy forms, the dark complexions contrasting with the whiteness of the head-dresses. Distance lends its glamour, and the filth and the odours of the streets are forgotten. All seems a picture culled from the *Thousand and One Nights* in the rosy light of the sunset, till the breeze wafts to us the noise of the rhythmic exhaust of the oil-engine. Then conscience smites us for our share in the anachronism.

## THE PHILOSOPHIC BABY.

To be sure it's rather nasty
To be put to bed at six,
To leave the nice, warm nurs'ry,
And my newest box of bricks;
But mother says that that's the time
When every baby goes;
So, after all, it must be best,
For mother always knows.

To be sure I'm getting rather tired
Of nursie when she coos
Those silly words she seems to think
Are what I ought to use;
But mother says that that's the way
A little boy's tongue grows;
So, after all, it must be best,
For mother always knows.

To be sure I'd like some other things
Than those I get to eat;
I'd like to taste a currant-bun,
And perhaps a bit of meat;
But mother says that little boys,
Who still wear ribbon bows,
Must eat just what is given them,
And mother always knows.

To be sure I'd rather not be washed
If I could have my way;
I really don't need soap at all—
At least, not every day;
But mother says unless I'm washed,
Not only where it shows,
I'd turn into a nigger boy,
And mother always knows.

And so I'm trying not to mind
What nursie makes me do;
I even kiss her now and then
(Last night I gave her two);
For mother says unless I try
Each day until its close,
I'll never be a hero-man,
And mother always knows.

# THE HEART OF THINGS.

By Henry Leach.

London, *Yesterday.*

AS the most thoughtless and indifferent people of this country have lately been made aware, we have a House of Lords, an Upper Chamber of parliamentary government which in most matters exercises a right of veto upon the legislative works of the Chamber below. Intensely interesting is this subject of the House of Lords, then; the debated questions of education, of Ireland, of the navy, and all such like are of faint colour in comparison. It is so great, so wonderful, that now when men come to approach it they seem sometimes to be afraid, and they are found asking themselves and others what the people of the past, who are dead and gone, would have done if they had been in like case with themselves, how they would have faced this most stupendous question, what line of policy they would have pursued. In particular do we find most curiously that in this present dilemma there has been some general disposition to speculate upon, or at all events to wonder, what Mr Gladstone would have done. It is as if they found some consolation for themselves in the knowledge that they are deprived of the assistance of his views, and so cannot be expected to move forward with determination and confidence. How futile must be all conjectures upon what those who have been long since dead would have done to-day, as if you could take a man of genius from his time and circumstances and his environment, and expect from him any likeness in thought and action when placed in others which are quite different! And let it be said that there is surely a greater difference between the circumstances and environments of to-day and twenty years ago than there was between that time in the eighties and a full century before. However, to some of us it will seem singular that it has been so little remembered during the violence of the recent political harangues that Mr Gladstone's very last speech in the House of Commons, this being in 1894, when he was eighty-five years of age, consisted of nothing but a vigorous assault upon the hereditary Chamber. Ten years before, in response to some fears that had been expressed by Queen Victoria, he had said that he hated the idea of organic change in the House of Lords, and would do much to avert that mischief. Time and circumstances had altered his view since then, and it was the Lords' amendments of the Parish Councils Bill which had brought him to propound the question publicly as to whether the work of the House of Lords is not merely to modify, but, as he put it, to annihilate the whole work of the House of Commons—work which had been performed at an amount of sacrifice of time, of labour, of convenience, and perhaps of health, but anyhow an amount of sacrifice totally unknown to the House of Lords. Speaking with some passion, he said: 'The differences, not of a temporary or casual nature merely, but differences of conviction, differences of prepossession, differences of mental habit, and differences of fundamental tendency, between the House of Lords and the House of Commons appear to have reached a development in the present year such as to create a state of things of which we are compelled to say that in our judgment it cannot continue. The issue which is raised between a deliberative assembly, elected by the votes of more than six millions of people, and a deliberative assembly occupied by many men of virtue, by many men of talent, of course with considerable diversities and varieties, is a controversy which, when once raised, must go forward to an issue.' Men of the Liberal way of thought had murmured against the House of Lords for long before that, but this utterance, deriving some extra force from being the subject of a valedictory speech, virtually marked the beginning of a more or less definite campaign which has slowly led up to the crisis of the present time.

* * *

Despite what has been said in high places about a 'single-Chamber conspiracy,' we may be well satisfied that there will be no ending of the Upper Chamber, although most certainly within a short

[*All Rights Reserved.*]

period of time there will be some mending of it. The manner of this mending is a subject which has not yet been debated, for the good reason that so much depends upon what party will take the initiative in the matter—the 'mountain' party, who are bent upon having their new earth, or the gentler souls to whom the old one is neither as a hell nor as a wilderness of desolation and sorrow for all that lords walk upon it and have some small share in the ordering of its arrangements. At this time, then, it is of special interest and profit to take a brief glance at some different suggestions that have been made from time to time in recent years, backed by a good weight of authority, for the improvement of the Upper House as a part of our legislative machinery. One recalls how, as far back as 1856, there was some preliminary nibbling at the idea of reform in the way of an innocent proposal that was made to give a life-peerage with a seat in the House to Sir James Parke as Baron Wensleydale, the underlying object being to strengthen the House as a judicial body. The ultimate consequences might have been of the most important character; but it failed, and the upshot was that Lord Wensleydale was given a hereditary peerage. Then, towards the end of the next decade, Earl Russell made an attempt to induce the Lords to admit life-peers, never more than twenty-eight at any one time, and to be drawn from the best classes, men distinguished in science, literature, and art, to their assembly. This scheme also failed, as did another one brought forward a year later, the object of which was to exclude the bishops from the House. Seldom have any of the lords themselves been stirred to move in the matter of reconstructing their own House. Why, indeed, should they? But it ought not to be forgotten, as it may be, that Lord Rosebery and the late Lord Salisbury both made efforts in this direction. The former, after failing in 1884 to obtain the appointment of a select committee to consider what alterations were necessary to promote the efficiency of the House, some four years later made another unsuccessful effort, and a scheme was brought forward by Lord Kenry (the Earl of Dunraven), one of the features of which was the power that it was proposed to give the County Councils to recommend one person each to the sovereign as a Lord of Parliament. Of course the scheme failed, and that of Lord Salisbury which followed it and shared the same fate proposed that from the holders of the chief offices in the Empire there should be selected by the Crown fifty life-peers. This Bill got to the second reading, but was then withdrawn. In the more recent times it has been the scheme of Lord Newton, propounded some three years ago, that attracted most attention, even though, like all others, it failed. A reduction in the number of hereditary peers was the key to this scheme, and Lord Newton proposed that the English peers should, like the Scottish and Irish, elect a proportion—placed at one-fourth—of their number as legislative peers. To these were to be added a hundred life-peers, of whom not more than ten were to be appointed every year, and a certain number of qualified peers. The suggested qualifications included, first, the holding at any time of high judicial office, of any Cabinet or Ministerial office, including both Parliamentary and Permanent Under-Secretaryships, the office of Lord-Lieutenant of Ireland, Viceroy of India, or Lieutenant-Governor of an Indian province, Governor-General, High Commissioner or Colonial Governor, Ambassador or Minister, Lord of the Admiralty or member of the Army Council, Vice-Admiral or higher rank in the navy, and Lieutenant-General or higher rank in the army. In the second place it was proposed that qualification should include election to serve in the House of Commons on at least two occasions before succeeding to the peerage. Those peers who were neither qualified nor elected were to be left free to seek election to the House of Commons. It may be remembered also that a little more than a year since Lord Wemyss propounded a scheme by which 'important national trading and other organised societies' should each name three peers in the current and each succeeding Parliament to speak and act on behalf of such societies on all questions in which they were interested, the names of the peers so nominated to be entered in the journals of the House, while the selection of them was to be left to the Lord Chancellor, the Marquis of Lansdowne, the Earl of Crewe, and the Earl of Halsbury. With such a diversity of view already expressed as to the lines upon which reform of the House of Lords might be conducted to the best purpose, it is sufficiently difficult to hazard any guess as to what is likely to happen in the near future, and parlour politicians will probably find the construction of an ideal second Chamber a subject more diverting and affording more scope for the exercise of their ingenuity than ever Cabinet-making has been. There are two interesting points that may be borne in mind. One is that only on one or two isolated occasions in recent years has there been any large muster of peers in the House, and then a considerable number of those who went forward to vote were actually unknown to the doorkeepers and officials. It is held that for all practical purposes a working rota of about one hundred and forty Unionist peers carries on the business. The other point is that almost any scheme of reform must necessarily embrace the disqualification of a large proportion of English peers from the right to sit in the House, and it has been found that when a peer ceases to possess a *de jure* right to legislate, even though he seldom or never exercises it, his rank and position tend to become a mere matter of tradition and convention. He becomes considerably less of a lord than he used to be. We have seen that happen in other countries.

* * *

During these present weeks there are few avenues of escape for the British people from this incessant talk of politics. The stranger who sits opposite to

you in the railway carriage exhibits an expansive geniality, and is moved to ask for your opinion upon the situation; the man who serves you at the shop-counter ventures hesitatingly to suggest that the results of the elections are no doubt satisfactory to many people; the waiter who attends upon you at your favourite restaurant tells you as you finish the fish that they have just got the news of a sensational Conservative gain somewhere up in Scotland; the men at your club, which is ostentatiously described in reference-books as 'non-political,' fall into the way of guessing with impartial inaccuracy as to what Free Trade and Tariff Reform really mean; the guests at your table dare to express their wonder as to what will happen to the House of Lords now; go to the theatre, and unless the words of the play enjoy the sacredness of Shakespeare, the actor will 'gag' in something about the Budget; and on Sunday, in the church or chapel, the parson in the pulpit will draw thinly veiled comparisons between Job, Peter, Judas Iscariot, and other biblical celebrities and the eminent statesmen of our time who are the ringleaders in the election business. Oh these politics, how unbearable they do become at the centres of British civilisation! Art, literature, science, finance—all things must stay in their progress while the people vote and vote, and there is a majority established for some one. The music-halls being free of politics, and the theatres providing, as we have suggested, no absolutely certain means of escape unless *Hamlet* or *Macbeth* is staged, it is happy to remember, as many of the weary do, that there is in London one form of complete relief at any rate, and one that becomes weekly more popular. Our minds may float away on music from the harassments of the hour.

* * *

We British are a dull, stodgy people of the coldest and most phlegmatic temperament, and, unlike the Latin and the Teutonic and the Gallic, and most other races, we have no instinctive love and appreciation of art, music, or some of the other things of the soul; nor do we create to any worthy effect. We are quite good commercially, and that is the best that can be said of us. These are not the opinions of the present writer, nor probably of the reader, but they are what has been stated over and over again by the higher critics in the fervour of their denunciation of their own people and their works. And yet one might challenge them to tell us of another place in the world where the musical season—speaking of the winter season—is now, or ever has been, completer, more thorough, more extensive, or better artistically or in any other way than in London at the present time. For some years past there has been a very evident increase in the desire for a critical appreciation of good music, not merely by those members of the higher classes who possess or make pretence of possession of æsthetic feelings, but by the middle classes who are commonly understood to have less soul than others. It is indeed the middle classes—and not the higher section of them either—who have forced the pace in musical matters in London. The state of things is that London now attracts and obtains unceasingly the best talent of the world, and that such talent plays or sings to audiences that could hardly be bettered. On any day of the week there is a rich variety in concerts; and, most noticeable of all, on Sundays the extensiveness of the musical entertainment is remarkable. The Sunday concert, indeed, which is held at every available hall in London, afternoon and evening, and at some of the variety theatres also, is probably, to some considerable extent, responsible for the increase of interest in music. Looking at the list of announcements of concerts for the next Sunday in the Metropolis, we find that they number more than a score. They are assisted by some good singers; but for the most part the music is instrumental, and it is of a kind that would have been unintelligible to an audience of what we might call average people ten years ago. Now the listeners pick holes in the execution, speak of composers' intentions, and compare the interpretation just submitted to one that they heard a little while since. This music is not the simple, ephemeral kind of thing that is brought along with the new comic operas, but—to glance down the programme for one particular day—is made up chiefly of the compositions of Beethoven, of Tschaikowsky, of Mendelssohn, of Wagner, of Rubinstein, Chopin, Saint-Saëns, and the others who were greatest, and we find the public decided in its tastes and insisting on their gratification, not being obligingly content with whatever may be offered to it. In these pages it has already been said how at the present time there is some kind of public passion being displayed for the work of the melancholy Tschaikowsky, whilst in the way of lighter fare it is discerned that there is hardly a composer in these days who is better liked by the ordinary people than that man of marvellous musical memory and wonderful imagination, who for nearly twenty years was master of the keys of the organ in the Madeleine in Paris, Charles Saint-Saëns. The knowledge of this great, new musical public is not deep; it extends but a little way into the mysteries and intricacies of composition and execution; but, such as it is, it is keenly intelligent and quickly improving. By some of the higher patrons of music its origin may be considered a little mean, for there can be no doubt that the invention of and rapid popularity achieved in recent years by different instruments designed for the mechanical production of music, especially the gramophone to begin with, and the mechanical piano-players as something much better afterwards, have been responsible for the awakening of a better musical instinct in the people than that which was abundantly satisfied with the repetition of the old ballads. This public now wants knowledge and more knowledge, and gains it constantly. The lives of the composers are studied, and the peculi-

arities of their temperaments, their dispositions, and their works are inquired into. Superficial as this interest and knowledge may be, and regarded with gentle contempt as it may be by the learned musicians, it will nevertheless lead on to some great results. Sir Herbert Beerbohm Tree, keen student of the spirit of the times, was among the earliest to appreciate this new feeling among the masses of the people, and he achieved a well-deserved success with his recent production of the play *Beethoven*, which, as one imagines, would hardly have been so well gained only ten years ago. All this is spoken of as being in London and of London; but the tendencies, as in all such cases, spread rapidly from the capital through the country, and the effects are already being experienced in distant places.

# LAURISTONS.

### CHAPTER XVI.—HOW THEY WENT TO CHURCH IN PEACE IN THE MORNING.

IN accordance with the wishes of Mrs Lauriston, who had been brought up a devout Presbyterian, Sunday morning in the country was always devoted to church-going.

It was not often she could go herself, indeed, for the walk was a long one, and she would not on that day make use of either Jerry MacClootie or his horses.

So Captain Charles always took the children—more, it must, I am afraid, be confessed for his wife's satisfaction than his own, since sitting still in church always wearied him.

As for Charlie, the sermon finished him completely, and the giving out of the text was the signal for him to wriggle comfortably into his own special corner of the high-backed pew and fall asleep at once.

The walk, however, was always a delight to them—down Castle Bear Hill, past the Duke's house and the General's, and across the open stretch of the Haven; across the high-road where the coaches ran to Uxbridge and Reading and Oxford; past the Green and its ponds, where the fair was held; and so into the village, with its odd little shops with their eyes all decently closed for Sunday.

When they got thus far Mavie always grew somewhat excited at the prospect of seeing the endless black stream of boys from Dr Nicholas's school, all in their Sunday tail-coats and hats, on their way to church.

They had got all the way to the butcher's shop at the corner by the church on this occasion without any sign of the boys, when Mavie, looking hopefully backwards, saw the head of the procession just coming out of the big gates.

'Oh daddie, do stop and let's see them pass! They *are* so ugly!' she cried, dancing with excitement.

So they drew in to the angle of the shop, and stood while the long, long line tramped slowly past. And the very big boys at the head only glanced carelessly at the sprightly little rosebud of a face, and scornfully at the boys, especially at Etienne, whose foreign hall-mark no residence in England could efface. But the middle-sized boys eyed her appreciatively, and some of them even looked back at her, and perhaps thought with sudden longing of similar sweet little faces at home.

The service passed off with no untoward happening. Captain Charles, in view of the strangers, no more than dozed, but Charlie slept quietly in his corner without apology or accident. John Sax found the methods of worship so different from what he was accustomed to that he was kept on the alert the whole time, and Etienne's wide black eyes rolled to and fro without ceasing at the strangeness of the whole proceedings.

When the service was over, they encountered, in the roadway just outside the church, four gentlemen who stood there laughing and talking, while the outflowing stream of worshippers parted and circled past observantly on either side.

One was tall and of a consciously fine presence, and very handsomely dressed, with a fresh, open face and short side-whiskers; the next was a thin gentleman in a straight black coat, with a heavy black stock; the third was round and stout, and of a jovial countenance; and the fourth had a foreign air about him and a somewhat subdued and less assured manner than the others.

They turned at sight of our little party and greeted Captain Lauriston warmly.

'Ah, here comes the man of wealth, with his treasures all about him,' said the tall man with the fresh face, and shook the whole party by the hand so cordially that Mavie proceeded forthwith and unblushingly to restore her fingers to their usual shape by straightening and chafing them with the other hand.

'But are these all your own, Captain?' he asked with interest on completion of the ceremony. 'Some of them seem much of a size, and the family likeness is not striking.'

'These are mine, your Highness,' said Captain Charles, indicating Mavie and Charles.

'Ah, ha! Now that we are properly introduced I must shake hands with them again,' said the Duke, and stretched a large, cordial hand to Mavie.

'Thank you, sir; if you don't mind I'd rather not. My hand is not quite better yet,' said she demurely; at which His Highness's jovial laugh waked the High Street.

'This is the grandson of the Marquis de Montessonne,' said Captain Charles, with his hand on Etienne's shoulder.

'Ah, I have met your grandfather, my boy. He is a very perfect gentleman, and sets us all an example in courtliness and manners.'

'And this is my little friend John Sax, whose father gave his life for mine at Dunkirk.'

'A noble record!' said the Duke. 'No man can do more than that. Live up to your father's memory, my lad, and you will do well,' and he shook John Sax's hand; and if the little lad's eyes twinkled quickly after it, it was perhaps not entirely due to the great man's grip.

'And here comes your regiment, Doctor,' said the Duke as the schoolboys filed past, all deferentially doffing their hats, for His Royal Highness was well known at the school, and was often round there for a game of cards with the Doctor.

'As fine a set of lads as ever I set eyes on, Doctor. If the Frenchmen come across, as they threaten, you must throw your young bulldogs at them till we are ready for them in London.'

'The young dogs have had one holiday out of me already on the strength of it,' said the Doctor with a quiet laugh. 'The smallest pretext suffices them.'

'Well, well, we were all boys once. Give 'em a whole day to-morrow from me, and tell 'em it's because they looked so well to-day.'

'A royal request is a command,' said the Doctor with a bow; 'and it will suit me very well to go to London myself to-morrow.—Captain Lauriston, it is about time your boy came to me.'

The other two, the jovial round man and the foreign-looking gentleman, had glanced quickly at one another at the mention of Etienne's name. They had reason to know it.

'How are you, Captain Lauriston?' said the round gentleman, and put the Captain's hand, after he had shaken it, into that of his companion, at the same time introducing him—'M. le Duc d'Orléans. He is living at Twickenham, but is good enough to visit me now and again at Rochester House. We were comrades in arms, you know, at'—— and he broke off abruptly, with a glance at Etienne, whose sharp black eyes were fixed suspiciously upon them, though it was not possible he could have known them.

'You find England agreeable, monsieur?' said Captain Charles.

'*Mon dieu*, monsieur, it is, at present, the only possible country—a refuge for all the distressed,' said the other quickly. 'It is good to be even permitted to live in these times.'

'Yes, the times are much out of joint over there; but perhaps they will mend.'

'Doubtless; but the people have felt their power. They will never be as they were.'

'Better, then, we will hope,' said Captain Charles, with his pleasant smile.

'Any change will be for the better, for they could not possibly be worse than they are.'

The Duke of Kent meanwhile was endeavouring to extract a promise from Mavie that she would come in one day and see his carriages and horses, of which he was very proud. But, so far, he had only been able to obtain a qualified acceptance, on the clear understanding that he would not shake hands with her again; at which his hearty laugh rang out once more along the High Street.

'At eight o'clock, then, General and M. le Duc,' said Dr Nicholas. 'His Royal Highness promises to join us in a rubber.' And he led the way towards the school-gates, while the stout gentleman and his friend went off towards Rochester House.

'Is he living with Dumouriez?' asked the Duke as they went along, Mavie dancing lightly at her father's side, and the boys discreetly in the rear.

'No; he only comes over to see him occasionally. He lives at Twickenham, and comes over here twice a week to teach my boys geography and mathematics,' said the Doctor.

'And is he a good teacher?'

'Better than he would have been five years ago, or than his father would ever have been. He has been learning in a hard school, and has taken his lessons to heart. If ever he should reach the throne'——

'*That* is not very likely,' said the Duke with conviction.

'Unlikelier things have happened,' said the old Doctor, taking a pinch of snuff, after offering his box to the Duke and Captain Charles, who both declined it. 'Life is made up of unlikely happenings. Who would ever have dreamt of a descendant of Henry of Navarre rubbing geography and mathematics into the thick heads of English boys in a school in Ealing?'

And who among them would have dreamt that the then unmarried Duke's little daughter would succeed to the British throne and see the century out? Some of them lived to see a part of it, but none of them the whole.

The Duke strolled on with them after they had parted with the Doctor, chatting pleasantly all the way, inquiring graciously for Mrs Lauriston, and discussing the late wedding, his new brother-in-law of Würtemberg's portion, and so on.

At his own gates he again offered his hand to Mavie, who curtsied very politely, but kept her own hands safely behind her, and he vowed if he had been in France he would have sent her to the Bastille for refusing the royal favours.

'There is no longer any Bastille, monsieur,' jerked Etienne dourly and half-unconsciously, so strung up was he with the gloomy thoughts that were rioting in his head.

'Well, it shall be the Tower, then,' said the Duke, laughing. 'We still have that.'

'Ah, but this is England!' said Etienne.

'And a much more comfortable country to live in than France, is it not, my little monsieur?'

'Truly, monsieur, in some respects.'

'We, at all events, wear our heads *on* our shoulders,' said the Duke, and raised his hat politely and went in through the great iron gates.

'Who was the stout gentleman, Monsieur Lauriston?' asked Etienne.

'General Dumouriez, my boy.' And the boy's face whitened and darkened. Dumouriez had commanded at Jemappes, where his father was killed.

He was too young to remember it, but he had heard.

'And M. d'Orléans—he must be the son of Egalité,' he said thoughtfully.

'Yes.'

'Egalité was a traitor. He voted for the King's death. I am glad that he was guillotined himself, and that his son has to teach in a school,' said the boy bitterly.

'It is best to judge no man too harshly,' said Captain Charles quietly. 'They were terrible times, and one never knows how much one could stand till one has been tried. In any case, Egalité paid.'

'Yes, he paid; and I am glad of it,' said the boy.

'What shall we do this afternoon, father?' asked Mavie, eager to pack every minute with delights.

'We will see what your mother says. I would like to get her out into the garden if possible. You youngsters can go for a ramble if you like.'

---

CHAPTER XVII.—HOW A MESSENGER CAME TO THEM IN THE AFTERNOON.

BUT that afternoon's arrangements were in other hands.

They were still at table, Mrs Lauriston rejoicing in their high spirits and eager chatter, when the unusual sound of a horse's hoofs on the gravel outside carried Mavie at a bound from her chair to the window.

'A man! Why, I do believe it's grandpa's John; but he's covered with dust, and his horse is all frothy!' she announced. And Captain Lauriston rose hastily, and went to meet so unusual a Sabbath messenger with a premonition of trouble; for these were troublous times, both inside the country and outside. One never knew what a day might bring forth.

'The master, sir!' was the groom's brief message; and he handed Captain Charles a letter, which he broke open hastily.

It was from Aunt Charlotte, at Grosvenor Place, and was as short as it was disturbing:

'DEAR CHARLES,—Our father has had a stroke, and Dr Berkeley fears it is serious. Please come at once. CHARLOTTE.'

'Go round and tell Jerry to saddle the Devil for me at once, John. Then go and get something to eat and drink. You have no further news than this?'

'Nothing, Mr Charles. They do seem to think he be very bad.'

'I shall go at once. You take a couple of hours' rest and come on after me. Have they sent for Mr Sax?'

'He was just coming in as I left, sir.'

And Captain Charles went in to break the bad news.

Within ten minutes the Devil was devouring the road to London with the pent-up fires which had gained him his name, but still he lagged behind Captain Charles's thoughts and fears.

His father was an old man, and life to those who held the helms of great concerns in these stormy times had been wearing and trying, however stout and hearty their faces to the world; and he had fancied more than once of late that the strong, hale face had begun to show signs of the fierceness of the struggle. God grant his worst fears unfounded, for the thought of possibly having to grip the jerking helm with such comparatively short preparation as he had had somewhat appalled him.

The toll-gate man heard his coming from afar, and knew him as he drew near, and flung the gates wide, and wondered at his speed, but found ample satisfaction in his hasty largesse.

So through Acton and Shepherd's Bush, and at last round the corner of Hyde Park and down Park Lane, and so to Grosvenor Place, in thirty-seven minutes from the time he mounted at Castle Bear Hill, and the Devil for once had run his course unchecked.

Old Simmonds the butler opened the door as he sprang down. A groom was waiting on the steps, and led the panting horse away, with a watchful eye on the champing mouth and fiery nostrils, and Charles Lauriston went quickly upstairs to what awaited him.

*(To be continued.)*

---

# REGIMENTAL PETS.

By HORACE WYNDHAM.

THE British soldier always has a soft corner in his heart for animals of all sorts, and a regiment without its complement of these would be almost like a regiment without rifles. In every barrack or camp throughout the Empire one may see numerous denizens of the fur and feather world accommodating themselves to military routine as though they were born to it. Every time the drum rolls or the stirring notes of the bugle peal out on a parade-ground there is a soldier's dog or cat or bird somewhere in the immediate vicinity. They are always treated with the utmost kindness, and often live to a good old age. At Edinburgh Castle to this day may be seen 'the dogs' cemetery,' a small plot of ground under the ramparts of the Argyle Battery, just below Mons Meg, where the canine friends of Highland regiments stationed there have been buried.

Army pets vary, naturally, with the particular quarter of the globe where the regiment to which they are attached may be stationed. In England, for example, one does not often see much beyond dogs and cats and canaries. When, however, troops

are abroad the range becomes wider, and barracks and cantonments will then be found to contain, in addition to the usual number of dogs and cats, all sorts of birds of rare and gorgeous plumage, mongooses, harmless snakes, monkeys, and even tame bears and lion-cubs. Of course, when these latter emerge from the cub-stage to something approaching maturity they have to be got rid of. As a rule they are then presented to the nearest Zoological Gardens, where their former masters visit them during their hours of leisure.

Should he be serving in the East, the soldier is almost certain to buy a monkey out of his first week's pay. He has probably heard extraordinary (and as a rule quite unfounded) tales of their ingenuity, and readily believes that with a little care and patience they can be taught to clean his rifle and equipment for him! Still, even when he discovers that this is an exaggeration on the part of the wily vendor, he is generally philosophic enough to make the best of a bad bargain, and will continue to share his rations with Jacko as though his purchase had not disappointed him. Sometimes Jacko, troubled by what may be a qualm of conscience, will seek to reward his kind benefactor by paying a surreptitious visit to the orderly-room and tearing up his defaulter-sheet! When this happens, however, a hard-hearted adjutant is apt to order poor Jacko's summary execution, or at least his confinement to a pole by means of a chain until the offence is purged. Of course the troops make a hero of the prisoner immediately, and reward him with so many tit-bits that a bilious attack is soon threatened.

After a monkey, a talking parrot is a soldier's most prized possession. He is generally sadly deceived in his bargain, for the artful native, who charges him many hard-earned rupees for such a treasure, does not hesitate to palm off upon him a bird which is no more likely to talk than to sing. However, his proud owner puts this down to natural shyness, and, having installed his new possession in a bamboo cage (procured from the nearest bazaar), patiently awaits results. Of course some parrots are great talkers—too much so at times, in the opinion of other occupants of the barrack-room—and chatter away from morning to night. But Polly, whether talkative or not, soon makes hosts of friends.

When troops are either embarking for or returning from foreign service there are apt to be a good many sad hearts among the owners of the numerous pets which the regiment has gathered together. This is especially the case where the canine contingent is concerned, for the War Office has laid it down that not more than eight dogs may be carried in any transport. Among a thousand rank and file this is naturally regarded as a very poor allowance, and great efforts are always made to smuggle a few extra ones on board. Such attempts, however, invariably fail, for the ship's officers keep a sharp lookout for canine stowaways, and closely examine kit-bags that appear too bulky. In these cases, of course, the only thing to do is for the soldier to say good-bye to his four-footed friend and hand him over to the care of a comrade who is remaining behind. Sometimes, however, the unauthorised dogs are so determined to follow their masters that nothing will stop them. A case in point occurred when the Second Battalion of the Cheshire Regiment was embarking for South Africa during the late war. As the transport began to move away from the quayside a black retriever that belonged to a sergeant jumped into the water and swam towards the vessel. A sailor lowered a noose, and, cleverly catching the poor animal, hoisted him on board.

There have been quite a number of veritable 'war-dogs' associated with the British army in many a hard-fought campaign all over the world. One of the first of which there is an authentic record was Dash, who accompanied the Royal Marines to Spain during the Carlist war of 1836. Then there was Sandy of the Royal Engineers, and Jack of the Scots Guards, each of whom barked like true British dogs at the battle of Inkerman and sustained wounds from Russian bayonets. On their return Queen Victoria presented both of them with medals.

Another old-time regimental pet was a black ram named Derby, belonging to the Ninety-fifth Foot. He was found in the streets during the assault on Kotch, in Rajputana, at the time of the Mutiny campaign. The officers' wives made him a scarlet coat embroidered with the regiment's battle-honours; and, thus apparelled, Derby marched proudly at the head of the band for the next five years. He then fell down a well at Hyderabad and was drowned.

In memory perhaps of the geese who saved Rome, the Grenadier Guards once owned a pet goose. His name was Peter, and he began his military career in Canada so long ago as the year 1838. He came back to England with the regiment, and settled down to what should have been a tranquil existence at the Tower. Unfortunately poor Peter had an adventurous disposition. This cost him dear, for one day he waddled out of the gateway and was run over by a cab. He was buried with military honours under the flagstones.

A full-grown billygoat has been associated with the Royal Welsh Fusiliers for something like two centuries. The regiment had one with them at the battle of Bunker's Hill. He seems to have been rather a warlike specimen of his tribe, for it is recorded that he killed a drummer-boy who was rash enough to ride him round a mess-table on St David's Day. In 1844 Queen Victoria presented the regiment with two goats, and since then others have come from the flock in Windsor Park as occasion required. The Seventh Hussars also adopted a goat which they found on the veldt while they were campaigning in South Africa.

The Seaforth Highlanders and the Royal Scots Fusiliers have both owned a deer as their regimental pet. Roderick, the property of the first-named corps, ended his days in the Dublin Zoological Gardens, where he had been sent for the unsoldier-like conduct of attacking a corporal. Another

regimental pet to meet with the same fate was a young tiger which the Dublin Fusiliers brought back to Ireland from India. The Seventeenth Lancers and the Nineteenth Hussars both adopted a bear-cub captured in the Himalayas. The one belonging to the former regiment was stolen by some natives, but was afterwards recovered. The military authorities are rather inclined to disapprove of wild animals as soldiers' pets. There is good reason for this, since sooner or later their natural instincts are bound to assert themselves, and they become a source of danger. When this happens they are either destroyed or else sent off to languish behind the bars of the nearest Zoological Gardens.

## WHO IS THE OLDEST READER OF 'CHAMBERS'S JOURNAL'?

FROM time to time communications reach the Editor—mostly from frank and kindly critics, and fewer from ill-natured ones—expressing pleasure and satisfaction with the reading matter in this periodical, or otherwise. Such frank expressions of approval or disapproval are always welcome, for they show that the writers are in earnest and have been thinking seriously about what they have read. It is impossible not to feel gratitude and satisfaction on hearing from a reader of many years' standing who takes the trouble to write: 'I am a great admirer of your *Journal*. I am sure it is the most entertaining and instructive journal published in this country.' Some write and mention that they have been interested readers for thirty, fifty, or sixty years, and are so still. It may not be easy to beat the record of Mr Thomas Wyles, M.C.P., late principal of Allesley Park College, who claims to have read this *Journal* for about seventy-four years, more than an average lifetime. We subjoin his letter, in which he asks if he is not the oldest reader. Mr Wyles must have started to read this *Journal* about 1835, three years after its foundation. It remains for our readers to say whether his claim is justified or not.

Mr Wyles, who was born in March 1818, was led to change from mercantile to educational work by the influence of James Simpson (1781-1853), advocate, Edinburgh, an enthusiast for better elementary education, who lectured and wrote books and pamphlets upon educational subjects. Simpson was a friend of Sir Walter Scott, and one of those who were consulted as to the publication of *Waverley*. Mr Wyles carried on a successful school for forty years (1848–88), and sends us two thoughtful and suggestive pamphlets with his views and experiences. One is upon 'The Duty of the Schoolmaster in Relation to the Function of Character,' the other on 'The Fitness of the Private School to British Wants and to the British Character.'

'CROSS HOUSE, KING'S NEWTON,
MELBOURNE, DERBY,
*Oct.* 23, 1909.

'To the Editor, or Messrs Chambers,
the Proprietors of *Chambers's Journal*.

'DEAR SIRS,—At the end of last century I wrote to Messrs Chambers suggesting that I was probably the oldest subscriber to their *Journal*. I then had a letter from one of the firm in reply; but I forget the contents, which were pleasant enough.

'Near ten years have since passed, and I am still a living subscriber to your *Journal*. My subscription dates from about the middle of the *first series* of the *Journal*. The sixth to the twelfth volumes of that series I had bound, and every volume since till two years past, since which I have not bound them. They have been *all* well read, and I cannot measure the advantages to me resulting from my reading them. I now commonly read them from cover to cover, except the serial novel. That I cannot read. Most of the earlier series have been read to ruin by my boys—I have had a large residential private school. Some volumes were given to village libraries; now I send them to a daughter for use in her family.

'I think I must be now the oldest subscriber, and shall be pleased to be so informed. I think the date when I began was about the middle thirties of last century.—I am, dear Sirs, yours most respectfully,

'THOMAS WYLES.'

## A RISING IN EMBRYO.

By Captain P. R. C. GROVES.

FROM an ethnological point of view, Sierra Leone and that portion of its adjoining hinterland which is known as the Protectorate hold perhaps a unique position in the African continent. Sierra Leone was once the seaboard terminus of a much-used trade route from the famous Timbuctoo—a town which, by the way, still remains one of the principal emporiums of Central Africa in spite of the comic press and the 'limerick' craze. During the sixteenth and seventeenth centuries the above-mentioned route was one of the principal channels through which the slave-trade drained the heart-blood of Africa. When Britain declared war on this infamous traffic, slave-caravans from the distant interior were seized on

arrival and the slaves set free on the spot where Freetown, the capital of Sierra Leone, now stands. The human cargoes of numerous slave-dhows captured up and down the coast were also liberated and set on shore here; and in 1787, and again in 1791, large parties of negro slaves from America were planted in Sierra Leone to form a colony. In addition to this flotsam and jetsam of the slave-trade, numerous tides of invasion swept outwards from time to time from the interior, and the receding of these tides left behind human débris, the remains of various decimated tribes.

Generally speaking, the accumulative result of these vicissitudes is that the colony is to-day, from an African point of view, the most cosmopolitan spot on that continent. A sort of pidgin-English is fast becoming the Esperanto of all the British possessions on the coast, but a perfect babel of strange African tongues may still be heard in Freetown. Although in many cases languages appear to have survived intermarriage, the mingling of the ideas, superstitions, and religions of various races has produced some strange results. It is, I think, a remarkable fact, for instance, that so uncivilised a community should possess a perfect mania for secret societies. These societies are extensive and apparently well organised—a fact for which I can account only on the supposition that they borrow their organisation from Freemasonry, which craft was probably introduced into Sierra Leone by the Foulahs, a race of Moslem Arabs who founded an extensive empire in the West Coast hinterland at the beginning of the eighteenth century. Chief among West African secret societies may be mentioned the 'Bundu' (a female society), the 'Porrah' (a male society), and two cannibal societies. These have various native names, which mean either leopard or crocodile. We have endeavoured for years to stamp them out, but they die hard; and I am informed that in the possession of the Church Missionary Society at Freetown is a crocodile skin which was used by the crocodile society within the last decade.

The *modus operandi* of these cannibal societies is simple, especially as the country chosen for operations is dense bush or forest. A man with the skin of a crocodile or a leopard bound on him lies in wait at some suitable spot in the vicinity of a bush-path at dusk, and when opportunity offers, pounces out on his victim, who is generally stabbed, although in some cases steel claws have been used. The murderer then carries his 'kill' to some out-of-the-way spot where the local 'lodge' has assembled for the feast. The principal difficulty in stamping out these diabolical societies has undoubtedly been the secret protection and assistance afforded by some local chief in whose hands the society is a power which enables him to terrorise and squeeze the country-side to his heart's content. In a dark bush-land country such as the greater part of Sierra Leone and its hinterland, where fetichism prevails and superstition is rife, it is only natural that the people should invest these secret societies with occult powers; and it is in this connection that the somewhat strange incident I am about to relate occurred.

A short time ago, while I was serving with a West African corps, the company to which I was attached was ordered up-country to a place called Mabanta. The company consisted of two officers (of whom I was the junior), an English colour-sergeant, and about a hundred and thirty blacks; and the station, which boasted a small fort overlooking the Mobolee River, also included a miniature village of huts for the men, and a couple of more pretentious huts for the officers and white non-commissioned officer. The men's huts were built round the four sides of a quadrangle, about one hundred yards square, which formed the parade-ground.

The station had not been garrisoned for some years, and we were fully occupied for several weeks in rebuilding and repairing huts, clearing roads through the bush, and in constructing a rifle-range. When at last we found time to investigate the sporting resources of the district, we found from numerous spoors that game was plentiful, but that the all-enveloping bush was so impenetrable that the chances of getting a shot at anything were very slight. For weeks we sallied out daily and tramped the tunnel-like bush-paths, but almost invariably with no result. Sometimes a fleeting shadow crossed the gloomy path ahead, but a snapshot in the uncertain light was seldom successful. We then turned our attention to fishing. The Mobolee, we found, was a limpid, rocky stream, with numerous deep pools; and these, after we discovered the right bait, yielded very good sport. Only those who have experienced the deadly monotony and dullness of a bush-station in West Africa can appreciate what a godsend that fishing was to us; for weeks we spent our leisure-hours—which were many—by the side of a certain pool, and the fun was often fast and furious. Then came the 'rains,' as the wet season is called down there. In twenty-four hours the river rose some ten feet, and from what the natives told us—and from other indications, such as water-marks on trees—we knew it would rise at least thirty more. It seemed that fishing would soon be impossible, as the river would inundate several hundreds of yards of bush, and the main stream would be unapproachable except in a frail dug-out canoe—far too unstable a craft to fish from. Necessity is the mother of invention. We decided to make a raft, anchor it to a large tree which grew on the banks, and reach it by paddling down a submerged bush-path in a canoe. At this stage we received a letter from a big chief named Brimasanda, who lived in a village across the river, about five miles from our station. The letter was written in fair English, and was delivered by Brimasanda's Creole secretary, who was also the author. It was to the effect that, now that the river had begun to rise and the water had grown muddy, the alligators—as crocodiles are invariably miscalled on the coast—would be numerous and dangerous; that fishing would be very unsafe; and that, as these creatures were bold and

voracious there, it would be advisable to warn the men not to go near the river, especially after dusk.

We told the Creole to convey our thanks to Brimasanda, but attached little importance to his communication, as we had not seen a single crocodile during several months. The warning to the men rather amused us, as we knew that, in spite of stringent orders and precautions, some of them were given to little freebooting forays across the river by night. After discussing the matter, we decided to convey the chief's message to the men, not because we believed in the numbers and ferocity of the crocodiles, but because we thought it might act as a deterrent to the nocturnal raids referred to. The men received the warning with broad grins, evidently regarding it as a piece of bluff on the part of Brimasanda, and closely connected with the mysterious disappearance of sundry fowls, bananas, yams, and other articles from that chief's village across the river.

We dismissed the incident from our minds, but it cropped up again a few days afterwards in the shape of a deputation from the men of the company. The deputation complained that Brimasanda had threatened that he would call up a 'debil alligator' to defend the passage of the river and protect him from robbery. We were naturally rather amused at the credulity of those who took such an obvious 'bluff' to heart; and Captain R., who was commandant, told them in effect to 'run away and play.'

Meanwhile the river had fallen as rapidly as it had risen, and we spent much time at our favourite pool, and made the most of what we knew could only be a temporary respite. As it turned out, those few days ended our fishing in the Mobolee. During that period a rather peculiar incident occurred, which proved very significant in the light of after events. Captain R. had played a big fish for about half-an-hour. After repeated rushes, which grew gradually weaker and weaker, it was at last obviously nearing complete exhaustion. Its great green back showed above the water as he pulled it in, and I stood waiting with the gaff, when suddenly there was a swirl, and R.'s winch shrieked and sang as the line ran out irresistibly for about twenty yards. We were both amazed at this extraordinary demonstration of vitality; but the probable solution never occurred to our minds—namely, that the exhausted fish had been taken by a crocodile. After this violent dash the fish appeared to sulk at the bottom, and nothing we could do would move it. Finally we concluded that it had most probably got away and left the cast entangled in some submerged bush or embedded in the bottom. We were fishing across a shallow flat over which the water had only lately risen, and knew that the total depth was nowhere more than five or six feet. Our stock of hooks and casts had nearly run out, and this was our last salmon-cast. After weighing these considerations, R. decided to go in and get it. Strange to say, neither of us realised the danger of this proceeding; we had frequently waded in the river, and, if we thought of crocodiles at all, felt ourselves quite safe in the shallows near the shore. We did not know then, as we learnt afterwards, that a crocodile always attacks in the shallows, where he can stalk his victim under cover of the mud at the bottom, which also gives him a purchase for his spring. I firmly believe, in the light of subsequent events, that R.'s white skin alone saved him on that occasion from a horrible death. R. stripped, waded in, swam out, and dived repeatedly, but was unable to reach the cast owing to a submerged bush. Then, at his suggestion, I went up-stream to where a canoe was tied, and brought it down to the spot. He clambered in, and began prodding about with a long pole which was used for punting, in the hope that he might be able to stir up the fish if it was still on the hook and sulking at the bottom. The effect was magical: there was a mighty swirl, and the reel shrieked again as another fifty yards of line ran out. This time the fish (probably inside a crocodile) was in deep water; and after many vain attempts to stir it up again, we finally gave up, and as dusk was approaching, pulled the line until it broke, and returned home mournfully in the dark.

Next day I took a party of about twenty men down to the river to cut logs to construct the proposed fishing-raft. After several hours' work, a number of suitable logs had been collected by the river-side. The heat in the bush had been of the Turkish bath variety, and as the men were streaming with perspiration, I suggested that they should bathe before returning to camp. The majority fell in with the proposal with alacrity, and were soon splashing about in the shallows at the very spot where the fishing incident of the previous day had occurred. One or two of the men seemed a little afraid to go in, but the others laughed at them; and I, to my eternal regret, encouraged them by mentioning that R. had been in at the very same spot on the previous day, and had gone out nearly to the edge of the shallows. The men seemed to enjoy themselves immensely, shouting and splashing like a party of schoolboys, and were loath to come out. However, after they had been in for about half-an-hour, and I found it was past one o'clock, I gave the order to 'fall in,' and walked away a few yards to where my sun-umbrella lay. As I stooped to pick it up I heard a short, gurgling scream, and turned in time to see the yellow soles of two feet disappear in a swirl; while, at the same instant, nineteen men, with yells of horror, rushed out of the water in a cloud of spray. The tragedy was over almost before I had realised it; the unfortunate man was taken with a lightning snap, as a fish takes a bait. The crocodile had probably crept to striking distance, under cover of the muddy water, and awaited an opportunity. When one of the men ventured out too far, and the strange white object on the bank—namely, myself—retired, that opportunity came. The appalling suddenness of the catastrophe was staggering; it seemed incredible

that death had just snatched a fellow-being from before my very eyes and in the broad light of day. It seemed impossible to realise that nothing could be done, although the fact was only too obvious. The man had been near the edge of the deep water, and had been carried out into the broad yellow torrent.

While I was still scanning the surface of the river for some half-expected sign, my attention was suddenly attracted by the survivors. They had been dancing up and down the bank, yelling like a party of madmen; but now, as if by common consent, they came together, and started off in a body in the direction of the nearest village, with the intention, as I somehow realised, of setting it on fire and attacking it. The reason? They believed that the crocodile which had just taken their comrade was a witch-crocodile, or, as they put it, 'alligator debil;' that, in short, Chief Brimasanda had carried out his threat. Their first thoughts, therefore, were of revenge! In a land of thatched huts a match is a most effective and handy weapon; a village in flames is a village in confusion, and therefore an easy prey for an attacking party. I think I must have realised their intention through seeing several of the party produce match-boxes as they started off. I called on them repeatedly to halt, but no notice was taken. Finally, in desperation, I made for the man whom I judged to be the ringleader, threw him to the ground, and sat on him.

From this point of vantage I addressed the others. I pointed out briefly that Brimasanda could put twenty thousand warriors in the field, and that the absurd course they proposed to take would bring overwhelming numbers upon us before we had time to prepare. Our proper course was to go back to camp quietly, when perhaps Captain R. would take up the matter and order the whole company out. The subterfuge was a success; from their standpoint, I was taking a very sensible view of matters, as, instead of pooh-poohing the asserted complicity of Brimasanda, I apparently believed in it. Much to my relief, they returned to headquarters with me quietly, and even exchanged the usual greetings with several villagers we met *en route*.

On arriving I sought out R. and explained what had happened. Almost at the same moment a tremendous uproar from the men's lines told of the fact that the news had spread to the garrison. Soon after the colour-sergeant came over, surrounded by an excited crowd, who demanded ammunition, and within ten minutes of my arrival the whole garrison was jabbering excitedly outside our hut. The latent savage in the West African soldier had been stirred, and the outlook was becoming more serious every moment. We knew that if the men took the law into their own hands and raided Brimasanda's territory, reprisals on a large scale would inevitably result; and if once the torch of war was lit, and carried through a portion of the country, it was impossible to say to what extent the conflagration would spread. No element seemed lacking to ensure a very considerable rising.

That the rising was averted was due to the masterly and tactful handling of the situation by R. He called a bugler and ordered him to go to the parade-ground and sound the 'Fall in.' To our great satisfaction, the men obeyed the call with alacrity; they perhaps expected to be led forth against Brimasanda's nearest village at once. When we arrived on the ground, there was, contrary to custom, much excited jabbering in the ranks; but the colour-sergeant reported that every man was present, and when, on our approach, he called the parade to attention the order was well carried out. When R. stepped forward to speak there was silence, save for the wailing of the women in the surrounding huts. He began by calling on one of the black non-commissioned officers, who was the son of a chief, and therefore a man of standing, to step forward and explain to him, on behalf of the men, what their grievance was and what they wanted. The man stepped forward and spoke excitedly and at some length, the gist of his speech being that Brimasanda was well known to be the head of an alligator society, of which many neighbouring chiefs were members; that he (Brimasanda) had threatened that he would place a 'debil alligator' to guard the river and prevent any member of the garrison from crossing; that he had gone even beyond his threat, and had caused one of their comrades to be eaten; and that they now desired ammunition in order to attack Brimasanda's nearest village to avenge themselves. The men applauded the speaker at intervals with exclamations of approval.

When the non-commissioned officer had finished, R. asked if there was any other man who had anything to say on the matter. Several promptly stepped forward, and R. heard them in turn. Then he himself made a speech. It was in the pidgin-English of the coast, and lasted over half-an-hour; but I always look back upon it as a masterpiece of oratory. In brief, it was to the effect that what they had said only amplified and supported what I had already told him; that in other circumstances he could never have credited such infamous conduct; but, at the same time, did they imagine for a moment that he was the sort of man who would permit them to take the law into their own hands? Was it not obvious to any man in his sober senses that one hundred and thirty men could not fight twenty thousand? They were to understand distinctly that he would do nothing in a hurry. The matter would be thrashed out; Brimasanda and the other accused chiefs would be sent for and given a fair hearing, in accordance with the customs of the white man. Finally, when the guilty parties were discovered, justice would be done and adequate punishment meted out. A 'palaver' would be held in two days' time, which all the chiefs in the district would be required to attend. He called for volunteers to act as runners to carry summonses to the various chiefs; but in the meantime, in order

to avoid any possibility of friction, no other men were to set foot outside the camp.

When R. finished his speech we had been on parade for nearly two hours, during the whole of which time the men had been standing to attention, any tendency to relapse into a less rigid position having been sternly checked by the colour-sergeant. R.'s tactics succeeded admirably. When the men had assembled on parade they were in a state of excitement and anger which threatened open mutiny; when the parade was dismissed the storm had passed, and the men walked off quietly to their huts, tired, and eager for the evening meal awaiting them. That night runners went out in all directions to summon the chiefs to the 'palaver.'

The arrival of the chiefs with their followers was quite an interesting sight; they all apparently considered it a state occasion, and did the thing in their best style. Brimasanda, as paramount chief, arrived last. His retinue was really imposing, and quite put the others in the shade. He was preceded by a sort of native band, consisting chiefly of tom-toms of various sizes. The din from these was appalling, and announced his approach while he was still quite a mile away. He himself was carried, on the heads of four men, in an elaborately decorated hammock, surmounted by a gay-coloured cloth canopy; a string of similar, though less gorgeous, hammocks, containing court dignitaries and their wives, followed in the rear. Brimasanda was a striking figure—a big man, with the stately carriage of an Arab, which was accentuated by a splendid scarlet gown; in his right hand he carried an immense spear with a burnished steel head. When his followers had squatted down with the others on the parade-ground, the company was marched on, and sat down opposite them, and the 'palaver' began.

R. led off with a brief speech, in which he explained the situation, Brimasanda's secretary acting as interpreter. Brimasanda spoke next. He possessed a remarkably deep and resonant voice, and was evidently a born orator, as his lengthy address was attentively listened to, and at the close there were signs of appreciation and applause even from some of our men. Then came innumerable speeches by various chiefs and representatives on both sides. Finally, after a sitting lasting several hours, the 'palaver' was 'set,' as they say on the coast; in other words, a decision was arrived at. The Creole secretary, who had been educated in the mission school at Freetown, and who was nothing if not up to date, would probably have written up the minutes of the meeting thus:

'That, in the opinion of the meeting, a secret alligator society undoubtedly existed in the neighbourhood; that a certain native soldier had been foully murdered by this society; that it had been conclusively proved that no one present was guilty of or implicated in the murder, or in any way connected with the said alligator society. Finally, the meeting unanimously passed a resolution to the effect that medicine-men should be employed to "scent out" the members of the above-mentioned society, the culprits to be handed over to the white captain to be dealt with as he thought fit. The proposals of Chief A. to the effect that the said culprits should be burnt alive, of Chief B. that they should be thrown to the alligators, and of Chief C. that they should be bound down in an ant-drive were rejected by a small majority, and the above resolution at length carried unanimously.'

The 'palaver' lasted several hours, and, needless to say, we were very thankful when at length it came to an end. The result, we both agreed, was most satisfactory; verbosity and action seldom go hand-in-hand; every man had had his say, and tranquillity had been restored.

A fortnight passed. We fondly imagined ourselves out of the wood, and, in fact, had almost dismissed the affair from our minds, when we received another polite note from Brimasanda. It was to the effect that he had secured a number of persons of both sexes who had been scented out by the medicine-men as 'alligator people,' and he now proposed to send them over to us for punishment! This was an extremely unpleasant and totally unexpected issue, and placed us once more on the horns of a dilemma. We had acquiesced in the decision arrived at at the big 'palaver' a fortnight before—namely, to deal with the malefactors if they were discovered—because it seemed an easy way out of the difficulty, and we never dreamt that any so-called 'alligator people' would be discovered. Now we found ourselves confronted with a choice of two evils: either to repudiate the bargain, which was to break faith with all concerned; or to undertake the punishment of a number of people who were most probably innocent, and had simply been picked out by the wily chief as 'undesirables.' There was also every likelihood of renewed trouble among the men if the alleged murderers of their comrade were brought into camp. We thought of communicating with the district commissioner, but found on inquiry that he was away on a visit to a remote part of the country. Happily for us, he came back unexpectedly; and we were only too pleased to put the knotty problem in his hands. I never learnt exactly how he dealt with the case, as we left for the coast not long afterwards; but I believe he sent the unfortunate suspects out of the district for some months.

Last summer I visited the Naval and Military Tournament at Olympia in London, and found that one of the principal items on the programme was an exhibition of bush-fighting by a detachment of the very West African corps to which I was attached when the above incident occurred. I walked through to the rear part of the building, and came face to face with a West African witch-doctor, in full and gruesome 'war-paint,' chatting affably in broken English to a Bluejacket. I glanced at the face under the weird head-gear, and recognised, much to my surprise, the very man who had led the party which started to burn the village of Mabanta, and whom I had been obliged to collar and sit on. He

caught sight of me, started with surprise, and ran forward eagerly, frankly delighted to see me again. He explained shamefacedly that he was dressed up to take part in the performance, but that he came on later in his uniform. After a few minutes he ran off, and brought forward several other men I knew and certainly had never expected to see again. Their views on London, and the extent of their comprehension of our civilisation, were distinctly interesting and sometimes very amusing; but the conversation soon veered round to West Africa, to the old station on the Mobolee River, and thus finally to the alligator incident.

'Now,' I said, turning to the man I had first met, 'you surely don't believe, now that you have seen London, that Momo Kamara was taken by a "debil alligator" that day?'

He looked dubious for a moment, and his reply, when it came, was rather unexpected. 'Plentee debil lib dis country too, sah,' he said.

I learnt afterwards from the sergeant-major, who came up just then, that he was referring to a kinematograph show he had seen at the Coliseum. One can quite understand that the shadowy figures which move in the bright light on the screen must appear supernatural to a savage; but taking the remark in a more literal sense—well, perhaps he was not so very far out after all.

---

# THE MONTH: SCIENCE AND ARTS.

### NON-ALCOHOLIC FRUIT-WINES.

N ideal non-alcoholic drink of distinct nutritious value is being made in Switzerland, where an extensive plant is engaged in the preparation of what may be termed non-alcoholic champagne and other unfermented fruit-wines, in their purest state, no deleterious substances being added for colouring, preserving, or any other purposes. The process by which the juices are preserved indefinitely in their natural condition and free from alcohol is by sterilisation. The fruit is brought from the fields, cleaned, and then dumped into huge electric presses each capable of holding five tons of fruit. Here the mass is pulped, and all the liquid is drawn off into a specially constructed sterilising apparatus, where, *in vacuo*, the juice is raised to a temperature of one hundred and fifty degrees Fahrenheit, and maintained thereat for half-an-hour. The result of this treatment is that all the organisms which set up fermentation and produce the fungi which convert the fruit-sugar into alcohol are completely destroyed. After being allowed to stand for a time, so that all sediment may subside, the wine is filtered and bottled, being subjected to a final sterilisation so as to destroy all lurking possibilities of fermentation in the bottle. To these juices no additions either of water or anything else are made, and during the whole process of manufacture the product is not touched by hand. The wines thus obtained are full-bodied, rich in proteid, and, as analysis has shown, there is not the slightest trace of alcohol or antiseptics. The beverages are inexpensive, and their variety enables the fancies of every palate to be satisfied. For tropical countries, where alcoholic beverages are so prejudicial to health, these drinks are of inestimable value, as experience in India has exemplified. Taken with aerated water or impregnated with a prana sparklet, they constitute a sparkling, refreshing, and nourishing drink.

### AN INVENTORS' EXHIBITION.

An example which might advantageously be followed in this country is the initiative displayed by the Royal Central Board of Trade at Stuttgart. The German Government, realising that national commercial supremacy is to a great degree inseparably associated with inventive enterprise, and that many an invention is lost because the inventor does not possess the wherewithal to exploit his idea and cannot enlist the attention of the capitalist, has decided to act as the go-between. An exhibition is to be held in which only inventions patented or in process of being patented within the empire will be displayed, and the attention of manufacturing and financial circles will be specially drawn to such ideas as should be commercially developed. In this manner the poor inventor who has spent his little all in protecting his pet idea will be brought directly and inexpensively before those who have the facilities for working the outcome of his ingenuity. At the same time he will be completely protected against the unscrupulous patent expert or heartless company promoter who profits by the ignorance or helplessness of such contributors to a commercial nation's prosperity.

### A NOVEL ELECTRIC WALL-PLUG.

Electric-light users who have wall-plug fittings realise the disadvantages and liability to unpleasant shocks incidental to the ordinary wall-plug. The flexible wire to the plug-pins passes through the front of the plug, and must come into contact with the user's hands. The cord is liable to fray and wear at the point where it enters the plug, and a short circuit is not an infrequent occurrence. To remedy this serious drawback there has been devised a novel plug which affords the user complete protection. The flexible wire enters the plug at the side, the front face carries a circular disc or shield of ample dimensions to protect the hand, and there is a short handle by means of which the plug is inserted and withdrawn. The wire is not brought

into touch with the hand at all, and should a short circuit ensue the fingers do not suffer. It is a natty and convenient device which should be adopted by all users of electric light who use such fittings. Ladies especially will appreciate its distinct advantages.

### STOVAINE, THE NEW ANÆSTHETIC.

Some months ago it was announced that Professor Jonnesco, of Bucharest, had successfully used in surgical operations a recently discovered anæsthetic, the remarkable property of which was that it rendered the patient insensible to pain without depriving him of consciousness. This new weapon of the surgeon, called stovaine, created considerable interest in the medical world, and its development was keenly followed. Professor Jonnesco carried out over seven hundred successful operations on the Continent, and at last came to London to demonstrate its remarkable possibilities and advantages over both chloroform and ether. The process, it may be pointed out, consists of hypodermically injecting a solution of stovaine and strychnia into the spinal canal, the effect being the temporary numbing of the nerves, so that the patient has no sense of feeling. Medical opinion is greatly divided as to its advantages in comparison with the more generally adopted anæsthetics. It is recognised that success to a great extent depends upon the skill and methods of the surgeon, the nervous temperament of the patient, and the character of the operation. For instance, the necessity of the syringe-needle being absolutely sterile is obvious, for should any foreign matter or organism enter the spinal canal thereby the consequences to the patient would be extremely serious. For abdominal operations it has the property of rendering the muscles of the abdomen perfectly flaccid, and thus facilitating the actions of the surgeon without affecting respiration in any way. Whether or not it is advisable for a patient to have his sense of feeling temporarily killed and yet be cognisant of the thousand and one little details attending an operation, and be a helpless listener to what is being said, is a point upon which medical opinion is very sharply divided.

### DAMP-PROOF FOOTWEAR.

An English inventor has conceived an ingenious idea for providing against damp footwear. Between the inner and outer soles is inserted a layer of rubber the full width of the sole, and tightly sewn thereto so as to render the whole solid. The point of such an arrangement is that although the sole may be thoroughly saturated with water, the moisture cannot be drawn through the leather by the heat of the foot within, as the rubber insulator arrests its progress. In order, however, to prevent the wet from forcing its way into the boot where the upper joins the sole—a vulnerable point of attack—a rubber feather is introduced, connecting with the sheet of rubber in the sole itself, and is continued for a short distance up the sides of the upper, being gradually tapered off so as to offer no obstruction to the foot. Within the boot—that is to say, the part of the sole encased by the upper—a layer of rubbered canvas is inserted between the inner sole and the rubber sheet beneath. The ingenuity of this simple idea, it will be seen, completely guards the foot against the entrance of water, and, moreover, the insulator is so perfect that it will outlast the boot itself. Another distinct advantage is also secured. The introduction of the rubber and canvas backing imparts a springiness and resiliency that is entirely lacking in the ordinary boot, and there is a complete absence of the disconcerting squeak in walking. The boot, being scientifically constructed, adequately coincides with the requirements of hygienic footwear, and, unlike many similar ideas, does not detract from smart appearance.

### A THOUSAND-DAY CLOCK.

Some months ago there appeared a horological novelty, the feature of which was the absence of the greater part of the mechanism incidental to ordinary timepieces, and the elimination of winding operations. The inventor's ingenuity has aroused considerable interest, including that of His Majesty the King. Weights and springs were displaced by a small dry battery such as one can purchase anywhere for a shilling or eighteenpence. Compared with the ordinary clock, its appearance at first is somewhat novel, especially in the skeleton types, where the familiar swinging pendulum is replaced by an oscillating wheel, the movement of which is controlled by regular intermittent magnetisation and demagnetisation action which alternately pulls the wheel round and then releases it so that it can swing back again, this cycle of operations continuing until the electric energy of the battery is exhausted. The oscillation is so timed as to occupy exactly a second each way, and once the regulation is effected the clock will go with unfailing accuracy. The average life of the battery employed is about a thousand days, and during this period the clock requires no attention whatever. Vibration does not affect its working, and it can be placed upside-down without any ill effects. The clock has been designed in a variety of attractive styles, with the battery concealed in the bed-plate or the pedestal, and has proved exceedingly popular. A few years ago the appearance of a clock which could run for four hundred days without winding created great surprise; but the evolution of a timepiece capable of running some three years without winding is a remarkable achievement of horological ingenuity.

### AN INDESTRUCTIBLE GARDEN-LABEL.

For years there has been diligent search for something new in the form of a garden-label which would be indestructible, whose inscription would be indelible, and which would be incapable of inflicting any injuries upon the trees from galvanic action such as attends the use of the

ordinary zinc label. Those who desire to avoid confusion in the names of roses, fruits, and so forth will consequently welcome the new porcelain tally that has recently been patented, and its innumerable advantages will compel interest. The tallies are made in various styles, according to requirements, in white porcelain, and are of substantial thickness, so that they cannot be readily broken, yet light, neat, small, and compact. It was found somewhat difficult to secure a porcelain body capable of withstanding all atmospheric variations, especially severe frost, and ordinary garden usage, but in this quest the inventors have proved completely successful. The fact that the inscription is absolutely indelible is the feature that will most appeal to the gardener, be he amateur or professional. The names are boldly printed beneath the glaze, and as the porcelain is fired at a very high temperature, chipping and cracking of the protective skin is impossible, and the name will preserve its pristine appearance indefinitely. The inscription is full, being, for instance, in the case of a hybrid perpetual rose, 'Sir Rowland Hill, H.P.' Another advantage is that the tally is always clean, and every shower of rain washes off any soil that may have become attached. Between eight hundred and one thousand names of roses, including all in the catalogue of the National Rose Society, have been prepared in this type of label; stocks of the leading fruit-trees, sweet-peas, and so forth have also been taken in hand, and the scheme is being gradually extended throughout the whole range of garden produce. The tree-tallies are pierced at one end with a small hole for attachment to the tree, and for this the inventors suggest a specially annealed aluminium wire they have secured, which is pliable, rustless, and will not cut the plants. Other labels for insertion in the ground or in pots are provided with a suitable end for this purpose. The tests that have been carried out prove that these labels are fully capable of withstanding the vagaries of the English climate, and the garden-lover will realise that they are the greatest advance in title-tallies that has yet been achieved. Moreover, special attention has been devoted to the question of price, it being realised that indestructibility, indelibility, and inexpensiveness are of equal importance.

### PRESERVING BODILY VITALITY.

While Professor Metchnikoff is advocating principles for lengthening the span of life, another scientist in the same field, Dr Doyen, is advancing means of retarding senile decay, or, in other words, of maintaining the human machine in its state of full activity during old age. It may be pointed out that this latest development is an off-shoot of the Metchnikoff theory—that is, the prevention of the self-poisoning, as it may be termed, of the body, and the continual warfare that is being waged between the white corpuscles of the blood and the harmful microbes which gain an entry into the system. For the preservation of vitality Dr Doyen uses therapeutic substances derived from ferments which possess the remarkable property of producing white corpuscles, so that the armies of the defenders in the body are overwhelmingly increased to resist the attacks of the poisoning invaders. This new energy-preserving medium he describes as mycolysine, and it is stated to be most energetic in its action, for it seizes upon and destroys the dangerous organisms before they can firmly establish themselves and thus extend infection. The learned scientist also states that owing to the quality mycolysine possesses of propagating the white corpuscles it is an excellent remedy for many of the maladies which attack the digestive and respiratory organs, such as bronchitis, colds, and so forth, and is even useful in assisting the body to combat such fell epidemical diseases as diphtheria by reinforcing the white corpuscle battalions. Though Dr Doyen does not claim that his treatment will lengthen life, as does Professor Metchnikoff, he maintains that it will lengthen the span of its effectiveness by preserving vitality. By reducing the period of inactivity described as old age it may be claimed as being practically a means of lengthening life, though not in the same way as the sour-milk treatment advocated by his illustrious brother scientist.

### MAKING CEMENT FROM BLAST-FURNACE SLAG.

Some months ago we drew attention to the activity in applied chemistry circles in the production of cement from the waste products of blast-furnaces represented by the slag. Many scientists have concentrated their energies upon the subject, and this country possesses the first complete practical works for the commercial utilisation of the idea. This factory is in Lanarkshire, and the process, invented by an eminent scientist, Dr Collescu, is being exploited by the Coltness Iron Company, who have vast quantities of the raw material immediately available. The slag is poured in its hot, liquid state from the ladles on to a rapidly revolving drum, and in so doing a solution of Epsom salts is sprayed upon the mass, which granulates the slag. The material is then taken up and deposited in the clinker-house, where it is left for several days. The clinker, as it is called, is then finely ground, after which the product is ready for the market. The process is very simple, and the cement is stated to be ideal, and quite as good as the ordinary Portland cement. The successful commercial exploitation of this process should prove of material value. Not only will it solve a burning problem in the vicinity of steelworks as to what to do with the waste slag, but it will tend towards cement manufacture being closely allied with iron production, and a new and additional source of revenue will be brought to the iron industry.

### A NEW ARTISTIC 'RUSTIC' FACING-BRICK.

Architects are proverbially fastidious, and rightly so, in all that concerns the artistic treatment of brick-faced buildings. For this reason great interest will

be centred in a recent production known as the 'ravenhead rustic.' This brick was first produced in response to a request of Professor Reilly, of Liverpool University, and therein that extreme of colour which is anathema to the architect is successfully avoided. In this material the smooth face is cut off, in which process, owing to special arrangements, a vibrating action is given, which causes thin, uneven lines to form an attractive, wavy, rough surface. When seen in the mass from a short distance, the colour-effects are distinctly artistic, there being an entire absence of any harshness in blending or overwhelming predominance of any one tone, while from a distance it has all the vraisemblance of well-preserved old brickwork. The brick has evidently caught the fancy of those responsible for designing buildings, for several important large undertakings in the north and centre of England are being faced therewith.

### PULQUE.

What is pulque? To this question it may without exaggeration be safely affirmed that not one person in a thousand could give a satisfactory answer, and yet in the country of its production, Mexico, it is as well known as beer is in our own. This refreshing and invigorating beverage is the fermented sap of an agave or American aloe, the *maguey* or century-plant of Mexico, a plant not unlike a kind of cactus, though it is neither a cactus nor an aloe. It grows to a height of from eight to twelve feet, and is cultivated principally for its sap. When the plant is about to bloom the flower-stalk is cut away and a deep excavation is made at its base, from which the sap is drawn daily for some two months; after which the plant dies down to the ground, making way for a new shoot, which requires several years to reach productiveness. The pulque or fermented sap has a somewhat milky appearance, and is both a food and a drink beverage, with a not unpleasant flavour. Though pulque (which should be pronounced *pool'kay*) is not intoxicating save in large quantities, a strong intoxicating spirit is distilled from it. Pulque is well known as a remedial agent, and its somewhat unique value lies in the fact that in kidney-troubles, such as dropsy, Bright's disease, &c., its use has been found to be very beneficial. Pulque is also said to be one of the few known substances that unite with and increase the volume of the gastric juice for the digestion and assimilation of food. These results have within recent years come more prominently under the notice of our own medical faculty, with the result that the consumption of pulque shows a considerable increase in this country.

### VENTILATING GAS-SUNBURNER.

A form of incandescent gas-burner has been evolved in Glasgow which is filling a rather unique position, being admirably adapted for halls, churches, theatres, &c., where it is desirable to control the lighting from a distance. It is designed to supersede the old style of gas circles or pendants which were suspended from roofs of large buildings, and which were fitted with a number of flat-flame jets. The new device is comparatively simple, being somewhat on the same lines as the old form of pendant, and having twenty-eight separate arms projecting from the centre pipe which is suspended from the roof. In each arm an inverted incandescent burner with mantle is fitted, while an enamelled reflector is placed at a convenient distance above. A guard underneath prevents anything falling from the burner on to those who may be below. An important feature of the arrangement is that the fitting is so made that the current of hot air caused by the burners passes up the ventilating shafts which are connected to the fitting, thus carrying off the products of combustion as well as materially assisting in the ventilation of the hall. An ingeniously arranged gas-tight cup-joint allows the whole fitting to be lifted up and then lowered to the body of the hall, thus entirely doing away with the use of dangerous and costly scaffolding. The burner has a lighting capacity of from fifteen to sixteen hundred candles, and only uses (at the Glasgow rate of two shillings per thousand cubic feet) about twopence worth of gas per hour. In some cases the burner has actually displaced pendants which unitedly gave not much more than half the illuminating power, and consumed about one shilling and tenpence worth of gas per hour. There is an entire absence of shadow with the new appliance; and as it is fitted with pilot or flash lights, it can easily be controlled from any convenient position in the hall, and is very convenient for kinematograph shows, &c. The capital cost is only ten guineas for the larger size, and thirty shillings less for the smaller.

### MIGRATION OF SEALS.

The migration of birds was discussed in these pages by Mr Harry F. Witherby in 1902, and last year the Hon. Gladys Graham Murray wrote upon 'Birds as Travellers.' Fresh examples are continually turning up, as, for instance, that of the stork shot in Natal with a brass ring round its neck bearing the name and address of a professor in Budapest. The migration of seals is not less remarkable. Last autumn it was reported from British Columbia that seals bearing the brand of the United States Government burnt into the skin of the animals at the United States branding-post on St Paul's Islands, in the Behring Sea, had been taken by sealers off the Falkland Islands. Captain Nicholas Brown, formerly a seal-hunter on the coast of British Columbia, wrote from the Falkland Islands stating that among his catch in Antarctic waters had been seals whose brands showed that they must have migrated from the Arctic Ocean to the waters surrounding the South Pole.

*To Correspondents* who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

# WHEN WINTER CAME TO GREEN'S FERRY.

By Byron E. Cooney.

## CHAPTER I.

THE old man religiously watered and weeded the verbena and phlox beds every evening except Sundays. He was the Mayor of Green's Ferry; but he was his own gardener, for to him legitimate labour was a wholesome thing, and Wallace Buchanan was no shirker. And where could such verbenas, such phlox, and such hedges be found as at Lodgewinna? Even visitors from Ottawa had stopped to admire them—they who had their Parliament Gardens to boast of. Already the maples were turning scarlet and the Virginia creepers had changed their green for golden; but, sheltered as they were by the close-cropped cedar hedges, frost had not yet blighted the hardy annuals.

'Guid-evenin', Mister Buchanan.'

Mr Buchanan pulled a tiny pig-weed out of the flower-bed and flung it on the gravelled walk before looking up.

'Good-evenin', Donald.'

It was one of the accepted social conditions of Green's Ferry that the Mayor should be called Mister and the groceryman Donald.

'D'ye ken will it freeze the nicht?'

'It's long overdue, Donald; and when the frost does come it's ma posies will be sufferin'. What's the news o' the town? I'm so busy wi' the water-franchise it's little time I have for speirin'.'

'The campers are a' gane hame.'

'All, did you say, Donald?'

'A' but the Van Peldts. Percy Van Peldt's in nae hurry. He says now he'll stay for the deer-huntin'.'

'They're nice people, are the Van Peldts,' said the Mayor decidedly.

'They are that!—they are that! An' it's guid money they have too. Faith! it's little gowd Green's Ferry saw till the Van Peldts cam' frae New York to throw it amang us like sawdust.'

'I'll warrant you got your share o' it, Donald?'

'Lord forbid I'll be graspin', Mister Buchanan; but Donald MacPherson nor none o' his kith are wastrels. Every little mak's a muckle, ye ken. I'll be sellin' next week.'

'No' to the Greens?'

'Ay.'

'Donald, how c'u'd ye?' the old man almost appealed.

'Weel, ma title's no' clear, an' I'm doublin' ma money; an' if you're wise, Mister Buchanan, you'll tak' Green's offer an' sell. Your title's nae better than mine, an' they'll be showin' ye that in the coort some day. There's a meetin' o' the guild at the kirk. Guid-nicht.'

'Good-night.'

Wallace Buchanan ground the pig-weed savagely under his heel as he walked to the rustic seat beneath the clematis vines. So MacPherson had sold his homestead on the water-front to the Greens, as Barclay and MacTavish and a dozen others had done during the summer. Had they no pride in the homes that had reared them that they must sell their hearthstones? Day by day he had watched them raze the house of Barclay to the ground; yesterday they had begun on MacTavish's; and now MacPherson, whose land adjoined his, was about to sell to the millionaire lumberman, whose dream it was to pile his wares from the mill to the city dock. The Mayor of Green's Ferry rested his chin on his hands and gazed down at the lake, where a floating village of boat-houses lay motionless on the glassy surface.

A great tow-boat rode majestically at anchor, and the smoke from its funnels stretched like a banner to the Quebec side. A dozen Frenchmen in a great red *bonne* sang a 'Come-all-ye,' and the four pairs of oars kept time to their magnificent voices. From the mouth of Clyde Creek an Indian in a solitary birch-bark canoe shot silently forth to throw his night-line in some distant bay. From every direction skiffs were returning, tired from the rompings

[*All Rights Reserved.*]

of the day. Subdued murmurs of evening drifted inland from over the water. Peace seemed to reign everywhere but in the heart of the lonely old Scot.

He was no sentimentalist, he told himself; but when his eyes turned landward to a group of pines, where white marbles marked the graves of Hector, of Gawain, and of Kenneth, his three sons, and of Maddie, his wife, and where a little plot was reserved in which he would lie some day, he clenched his teeth.

'Never,' he vowed—'never would the Greens pile their lathes and shingles on the consecrated ground!' And the Greens had acted fair with him—in justice to them, they had. They had offered him twice the value of the land; and now that he still refused, they had threatened him with a flaw in his title and a legal suit, which would give them possession of the land they claimed as rightly belonging to them.

Green's Ferry had an unexplainable charm for the Van Peldts. Of the dozen resorts haunted by the new-rich cult, or desecrated by the breath of commercial atmosphere, they had grown gradually weary, and they discovered Green's Ferry, glorious in the grandeur of a Canadian autumn, and very much as God had made it. Percy said he would stay for the deer-hunting, and there were no opposing voices. His mother, a quiet old lady, had six weeks to spare before leaving for Europe, and the opening of the New York season did not interest her in the least. Uncle Todd had found some specimens of nodular barite in the Laurentine Mountains, and would be content to hunt for more until the snow fell. So the storm-shutters were put on the house at Cromarty Head, the house the Van Peldts called a cottage and the villagers called a mansion.

Three-fourths of the population had left the city. They were mostly Government officials and their families who came from Ottawa to spend the summer months at Green's Ferry, where the river widens into Lake Lomond, one of the series of landlocked lakes of the Upper Ottawa, ideal for fishing, boating, and seclusion. The people here were new people to Percy Van Peldt, types he never knew were in existence. They had all the American cordiality, yet all the Old World dignity. Van Peldt was no student of conditions sociological, yet the people puzzled him. He had considered Maddie Buchanan a provincial maiden, and had found by gentle intimation that he was mistaken. She accepted his attentions with the rare grace of social experience, corrected his geography, smiled indulgently at the sadness of his attempted quotations, and told him the part the locality bore in the history of the nation.

He had played with millions almost from his boyhood, and was developing into a shrewd financier when he tired of the game of speculation. Society had been a fad until the futility of its objectless competition dawned on him; an unsuccessful love-affair with a woman several years his senior, which failed only because he had no title in addition to his wealth, occupied a year of his life, and made him a cynic for six months. Now he had returned to the primitive period of boyish enjoyment of everything in life, and he played golf or trolled for pike with all the enthusiasm of sixteen.

But somehow the people here were not impressed with his monster parade of wealth. His yachts, his dogs, his horses, and his men-servants they noted, but they seemed to value quality more. Here, on the very edge of the world, on the fringe of civilisation, where from the crest of the Laurentines, a few miles away, the unbroken timber-belt stretched to Hudson Bay, he found a race of people, quiet, educated, and cultured, and taking no odds from the great boasting world without.

It worried Van Peldt to find Douglas Craig Douglas so much with Maddie, for the man, himself, was something of a surprise. The Queen's Counsel and captain of the Strathmore Guards was a good man to look at in any country. He thought it all very strange—strange that these people could interest him even as the Laurentine's crystals of selenite interested his studious uncle Todd. Every one was leaving Green's Ferry; but he did not care—he was waiting for the deer-stalking.

To Wallace Buchanan fate had left nothing but Maddie and Lodgewinna. The two men were thinking, as she ran down to the golf-links in the crisp air of a November morning, what more could man want? She threw her cape to Percy as though he had been a lackey, and Douglas frowned. Mentally the men sparred for favours even such as that. She caught Van Peldt's eye admiring her costume, for he had the eye of an artist, and could not but appreciate the harmonious blending of the plaid.

'The Buchanan plaid—mine by right of birth,' she said proudly, and the game began.

Douglas Craig Douglas had told Maddie Buchanan the story of his love in no outburst of emotion. It had been unfolded to her in a thousand golden days of blissful association. It had been breathed to her in the message of a bunch of wild violets, and sung to her in his ballad in the parlour of Lodgewinna; she recognised it in the tone of his voice, the touch of his hand, and the look in his kindly eyes, which lighted to their full fire at the sight of her. He had a well-balanced mind, with an intelligent grasp of his emotions, but extravagantly learned, and lazy with the procrastination of the optimist.

The advent of the Van Peldts boded Douglas no good. He noted the girl's recent preference for the society of Percy, but his well-trained tongue gave no sign of the distress of his mind. He weighed sadly his personality against the wealth and attractions of Van Peldt, but his balance was not the balance of Maddie Buchanan. When the game was over he stepped into his birch-bark canoe.

Such lonely excursions were becoming more frequent. Van Peldt held Maddie's cape, absently watching the flight of a flock of waterfowl; the *garçon* laboured up the terrace with the clubs; and Maddie, kneeling by the edge of the floating dock, steadied the frail craft with one hand.

'Have a care, Douglas; there's a squall coming down the lake.'

'One yeoman of the Guard more or less matters little to the Queen,' he laughed with affected carelessness.

'If he were loyal to his Queen it would matter much,' she answered seriously.

'He has been a loyal Guardsman,' the answer came back firmly, 'but the Queen favours the navy;' and he glanced at the launch where she spent most of her time with Van Peldt.

'Treason—high treason and insubordination. You shall suffer for this.' She laughed merrily at the threat.

'I have suffered.' His eyes sought hers slowly and sadly, and a moment later he swung his boat's head into open water and far out with one muscular stroke.

Deer-shooting would not have held Percy Van Peldt long at Cromarty Head if Maddie Buchanan were not at Green's Ferry; but, in justice to the boy, he did not know it. Village gossips talked long and in detail of the attention the young millionaire was paying Maddie. They regarded Douglas Craig Douglas as a jilted lover. Some denounced the girl as heartless; others commended her as wise. The envious laughed derisively.

'The Buchanans are puir as kirk-mice, an' prood as the deil—the young ane is, onyway. She'll no' get the gilt she's dreamin' on. Van Peldt'll be aff wi' a laugh when he's tired o' playin' a mere game o' hearts. He's a summer-bird that gaes sooth whan the snaw comes, an' mates but for a season.'

'Weel, there's Douglas Craig Douglas to turn to if she doesna marry the Yankee.'

'There's nae skit o' a girl can break the heart o' a Douglas an' mend it again. A sair prood heart has Douglas got, an' it's nae second-fiddle he'll play to a dandy wi' muckle money an' little brains.'

'Weel, the Yankee can save Lodgewinna frae the graspin' o' Jerry Green's clutches. They say this Van fellow c'u'd buy the lumber company, an' never think twice o' the money.'

And so the villagers discussed in public delicate possibilities that had scarcely entered the minds of the principals.

The conversation of the two cronies was occasioned by the sight of Maddie and Percy walking from the landing.

A day had passed when the little launch *Genevieve* swung into the bay from Cromarty Head, and ploughed through the white-caps like a reed-bird.

'There's a wheen o' sheep on the water beyond the bight,' the wharfinger remarked, 'an' a dirty squall must ha'e caught Douglas in his birk-canoe.'

'Has Douglas not returned since yesterday?' asked Maddie in sudden alarm. 'What could have happened him, Baldie?'

'Naethin' serious, Miss Maddie. He's a seaworthy man is Douglas, an' no' ane to be tricked by a gale. Spent the nicht wi' the "habitat" French on the Quebec side, I'll be bound, an' he'll hug the shore hame when the wind drops wi' the sun.'

'"I'll be the cook, and the captain bold, and the crew of the *Nancy* brig,"' quoted Percy. 'Be here in an hour, boys.' And he tucked the oilskins about Maddie and took the wheel.

They were untying the snub when a messenger handed him a telegram. It was common talk among the villagers that the young millionaire often received as many as a dozen telegrams a day—strange and unintelligible ones that the local operator regretted he could not decipher for the benefit of his friends. Consulting a note-book, Van Peldt translated:

'Abature 137⅞ abaft 63 albatros 96⅜ albumen 66½ viper 26 viper preferred 45⅝ Runkle bearing abature. Advise us. HOGE, BROWN, & HOGE.'

He wrote: 'Bull abature to 150; sell viper.' Then he drummed on his teeth with a pencil, and added: 'Wipe Runkle off the earth, delusion, deminond.'

'I guess that will hold Runkle.' He laughed quietly.

'Who's Runkle?' asked Maddie.

'A fellow who thinks it's clever to bother me. I just wired my broker to wipe him off the map.'

'Break him?'

'Yes.'

'How?'

'Well, Runkle's worth a few hundred thousand dollars to-day. To-morrow he won't be worth five cents.'

'How cruel you are!' The girl shuddered. 'Has he any wife—any one who cares?'

'Really, I don't know; that's his affair. He's used to getting pinched. He made what little he has on Wall Street; let him lose it there. You see, it's all in the game. They get rich and go broke every hour there. Runkle took a delight in bothering me.'

'I don't care,' she concluded. 'I'm sorry for Runkle, whoever he is.'

The *Genevieve* puffed into the landlocked bay, where nothing but the swell from the outer world disturbed the peaceful waters. No shrieking nor'easter, no chop, no angry, racing white-caps. Sheltered on all sides from the wind, Marshal's Bight presented a perfect picture of serenity. It seemed that summer was loitering here, overlooking the threatened approach of angry winter. A great sturgeon leaped in the air far out of the water, and fell with an awkward splash on its side, sending a widening circle of waves across the pond; noiselessly

the turtles dropped from their perches on grounded logs at the boat's approach; and a great crane rose slowly from the sedges and lumbered across the headlands. Scarlet maples hedged the water on all sides, and white-and-yellow pond-lilies sweetened the air already heavy with the strange perfume of a Canadian autumn. The launch rocked gently on the swell. Neither spoke. Percy Van Peldt looked at the girl long and steadily. For the first time in his life he was tongue-tied. He had thrown diamonds in the lap of a prima-donna, pleaded his suit with eloquence to a fascinating widow, piled roses at the feet of a piquant *débutante;* yet in the presence of this girl, who, he knew, was his superior by divine right of intelligence, he was silent.

Maddie Buchanan's brown hair, damp with the spray beneath her yachting-cap, clung in circles to her temples; her red lips pouted with the tantalising fullness of youth. A perpetual smile, natural as the sunshine, beamed from her eyes. She was waiting. What strange clairvoyant power have women to read men's unuttered thoughts of love? She knew all the setting was so perfect as to render her irresistible; she knew that to-day Van Peldt would tell in full the story that each day of the last two months he had but told in part.

'Maddie'—his voice was hoarse with nervous tension—'Maddie, can't you see I love you?'

She half-closed her eyes and leaned back against the cushions without speaking. She was thinking how superior women are to men at such times. A whizzing dragon-fly, all green and purple and gold, lit on the gunwale of the boat.

'Maddie'—his voice had a startling earnestness—'are you marble and steel, or flesh and blood? I love you!—love you!—love you! Do you hear—do you care?' Mentally he cursed himself that he could find no better expression for his passion.

'I hear, Percy;' and the smile dimpled about her lips with encouraging friendliness. He caught her hand in the frenzy of the moment, fondled it, kissed it, but she made no attempt to withdraw it. A moment more and he would have had her in his arms.

'I love you better than life, honour, family, wealth, everything—anything. You are dearer to me'——

'Percy, stop! Let me go! Don't you dare!' Her voice took on a tone all men recognise; it is not the tone of love. 'I am a Buchanan. My affection is not the affair of a season. Love has a deeper meaning to us of the North. It means life's happiness or misery. I am no seaside maiden counting her so-called conquests on her finger-tips; I'——

'Maddie, listen! I swear by the eternal God, by the honour of a Van Peldt, I love you as man never loved a woman before! I offer you all—myself, my fortune, my virtues, my vices, everything I throw at your feet. I ask you, in as sacred a mood as ever man asked a woman, to be my wife. Maddie, your wish will be my command. I will strew your path with gold and diamonds. You will have wealth, position, prominence. You will excite the envy of the world's most favoured. Your home will be anywhere and everywhere you desire; the dreams and hopes of your childhood will be realised. Oh! I will love you always, truly, tenderly, loyally. Maddie, be my wife!'

She drew herself away from him.

'All this isn't fair to me,' she said. 'You speak on impulse. This is a madness of the moment; you are intoxicated with the glory of your surroundings. Percy'—her tone changed—'you have been awfully nice to me, and I appreciate now the seriousness and honour of your offer; but—but—I don't love you,' she concluded simply.

'Whom do you love? Douglas Craig Douglas?' he asked savagely.

She laughed a clear, ringing laugh that startled a bittern out of the shrubbery. Her eyes twinkled merrily. Douglas Craig Douglas would never have asked such a question, not if his heart was breaking.

'That would be telling,' she answered.

Maddie Buchanan was very much like any other girl after all. She laid her hand on Van Peldt's arm. 'Percy, you have paid me a very great compliment; but promise me you will not mention the matter again—to-day.'

Sullenly he headed the boat for home, and as he leaned over the bow to brush away the gathered bunch of weeds, a corked flask bobbing buoyantly on the waters touched his hand. Instinctively he grasped it, and a piece of birch-bark within caught his attention. There was writing on the bark. Carelessly he broke the bottle over the gunwale and read a message written with a pencil:

'Stranded on Desolation Island—boat gone—nothing to eat. Send *bonne* or launch.

'Douglas Craig Douglas.'

Percy Van Peldt's back was turned to the girl, and she could not see the expression of his face. He bit his lip till the blood came. At length he crumpled the missive and threw it far out on the swell.

'What was that?' asked Maddie.

'A message from a marooned sailor on a desert island,' he answered.

'How romantic!'

Both laughed.

He turned his face to the cold north wind to cool the flush of it. Shame for the thing he had done drove the blood to his temples.

'All's fair in love and war.' He quoted to himself the lying old adage.

Twenty years ago a fire had swept over Desolation Island, and from that day no living thing had grown upon it. It lay far from the main channel, out of the course of navigation, and a man might starve or freeze to death upon it before he could signal a boat in passing.

The voyage home was made in silence. On the wharf a crowd shouted and gesticulated.

'What's the row, Baldie?' asked Van Peldt.

'Douglas Craig Douglas's canoe has been found floatin' bottom up,' said the wharfinger, shaking his head dolefully. 'It's a sair day for Green's Ferry when the likes o' Douglas is gone.'

'My launch is at your disposal if you wish to look for him, Baldie;' and the boy almost choked at the hypocrisy of his own words.

'We needna look for him for nine days, Mister Van Peldt. Naethin' but a grapplin'-iron or the boom o' a cannon 'll bring him to the surface before then.'

'Poor old Douglas!' said Van Peldt as they walked up to Lodgewinna. He was thinking of the wretched Queen's Counsel shivering on his rock, with the second cold night approaching.

'He was a prince, Percy!' Maddie thought of Douglas as one dead. 'I'm going to be very lonely to-night. Come over after dinner. And, Percy, promise me you 'll do something for poor Runkle.'

She entered the darkened parlour, to find her father sitting alone, with his head buried in his hands.

'Daddy'—she put her face close to his grizzled cheek—'we are not going to lose Lodgewinna.'

It often requires the weakness of a dear one to bring out the strength of another. It moved Maddie to a sudden resolve. Matters were moving quickly for her.

Wallace Buchanan was a very tired old man, too tired to think or question, and bowed with age and weariness that he had never dared show the residents of Green's Ferry in his official capacity of Mayor.

'And, daddy—oh, daddy!' she cried, 'Douglas Craig Douglas was drowned in the squall yesterday, for his canoe drifted into the landing to-day bottom up.'

Her voice quavered for a moment.

The old man sprang to his feet. He was once more Mayor of Green's Ferry. Maddie held his greatcoat, and he took his stoutest stick from the rack.

'I may not be back the nicht. There's work to do, and my place is wi' the rest o' them at the water-front.'

*(To be continued.)*

---

# A CRITIC IN THE HOUSE.

## HOME DIALOGUES.

By WALTER SHAW SPARROW, Author of *Old England, The English House, Hints on House Furnishing,* &c.

### I.—ON HOUSEWIVES AND SERVANTS.

OLD Mrs Agnew is well known in London as a disciple of Pugin, Ruskin, and William Morris. She knows their books by heart, and understands them critically. That is why the young speak of her as old-fashioned. She is an expert in the household arts, and they are not. Yet they do not take too much advantage of their inferior position. From time to time, indeed, the young go to Mrs Agnew for advice, and sometimes they follow it without the least hesitation or contradiction.

Four months ago, on her eightieth birthday, three young women called at ten in the morning, and Mrs Agnew beamed as she took their offering of flowers. One visitor, Mrs Richards, was sentimental, practice having taught her to be too sympathetic; another, Mrs Lynch, famous in the golfing world, spoke of 'the hump' as the present condition of her own feeling for town-life; it was only Miss Rae Brown, M.D., who started a conversation on a serious topic.

'Your health is truly wonderful,' said she with a diagnostic gravity.—'Mrs Agnew belongs to the Waterloo generation, you know—a very strong generation,' she added smilingly, but with just enough pomp of manner to do justice to a self-evident verdict.

Mrs Lynch approved. 'Waterloo generation!' she exclaimed. 'Stunning phrase! Off the top shelf—quite.'

'To look back on eighty years,' Miss Rae Brown went on, 'must be a conservative education.'

Mrs Agnew nodded and smiled. 'I remember about seventy-five of them perhaps, all busy years, and none really unpleasant, for I took pride in my home, I loved housekeeping. Every detail of it appealed to me, and never worried me.'

'Yes; but servants were good in those days,' Miss Rae Brown explained.

'Sure of that?' the old dame replied. 'Servants have never been good in England according to some critics. They were very bad in Dean Swift's time; the Dean said so, and he had a nasty temper, you 'll recollect.'

The listeners exchanged glances. To Mrs Lynch Dean Swift was 'something of a rotter,' and Mrs Richards told her black poodle to behave himself. Then she said, 'And your own servants, dear Mrs Agnew, what have *they* been like?'

'Just female human nature, nothing more,' came the quick reply.

'Bosh!' said Mrs Lynch in rare good humour.

'They spent all their money on dress,' Mrs Agnew continued; 'not underclothing, you may be sure, but just that part of dress which every eye could see at once. And criticism made them restive, of course, and they were quick to find fault; it did

'em good to talk about their grievances, whether real or imagined. Nerves, you see. Not so bad as nerves are now, my dears, because self-pity wasn't then a habit with womenfolk. We ruled at home as best we could, accepting our lot in life without rebellion—as a rule.'

'Less courage was needed then, perhaps,' Miss Rae Brown suggested.

'Courage! It's common-sense we women need. Still, you'll never learn from me. Youth never listens to old age, but hunts for its own experience, ransacking the most ancient follies and mistakes. One day you will know that the heart of the world keeps very old-fashioned; it never allows women to stray far from housewifery.'

But Mrs Lynch replied, 'You go no trumps on a bad hand, I think, dear Mrs Agnew;' and Miss Rae Brown approved. 'Women advance rapidly,' she dogmatised. 'They are man's equal to-day in many walks of life.'

'Is that important?' Mrs Agnew asked. 'The business of women, to my old mind, is to do finely what men can't do at all.'

'But why should man be a favoured mortal?' said Mrs Richards warmly. 'And why should woman have all the drudgery?'

'Tut, tut!' the old lady cried. 'Is there no drudgery in examinations, no drudgery in office-work, no drudgery in politics? To govern a home well is a woman's duty and art, and it needs as much talent as your high-flown wish to be male-women harassed by a business-fight against men.'

'You simple, dear old darling!' said Mrs Richards gently, 'you might think differently if girls in your time had been rightly educated.'

Mrs Agnew shook her finger playfully, as if a spoiled child had said something absurd. 'Modern talk,' said she; 'and very idle talk, too! With all your education, you know nothing about the history of your own sex. Turn to any almanac of George the Third's time, and you'll be surprised by the mathematical problems which girls did then in competition, as ambitious minds of the present day do "limericks." Then, as to your medical examinations and the rest, why, bless me! that sort of thing began in Italy during the thirteenth century, and for about five hundred and seventy years it had intermittent fashion there. Girl-graduates were found in the universities, and female professors also, not to speak of women writers and painters, scores and scores of 'em, poor dears; and what did Italy gain? Nothing. Italy went downhill despite her female marvels. It was good housewifery here and there that kept her alive, not the Brembatis, and the Angussolas, and the Agnesis, who were inferior to male barristers and painters and mathematicians.'

'For all that,' said Mrs Lynch, 'I prefer hockey and golf to housekeeping. Besides, home affairs are jeered at to-day.'

'By whom, pray?'

'By everybody—almost. To say a wife is a tip-top housekeeper is to imply that she is dull, uninteresting, stupid, an account-book without a cover, a woman without attraction, a frump!'

'Polly, don't be a fool!' replied Mrs Agnew. 'You expect bad housewives to condemn themselves by praising the good. The many laugh at the few, but the minority counts, believe me; it will win the day.'

'In a hundred years, perhaps,' cried Miss Rae Brown. 'Meantime, dear Mrs Agnew, household work is hated by most women, for it brings no credit.'

'It doesn't pay,' said Mrs Lynch. 'No woman can dress herself out of housekeeping. So there!'

Mrs Agnew sighed. 'I'm too old to understand that,' said she; 'but one thing I do see clearly. At a time when examinations are in vogue, and when degrees are as common as blackberries in autumn, there should be diplomas for housewifery as for other professions. Let the State give prizes and degrees.'

'It might do some good,' Mrs Richards assented; 'but housekeeping is so very secluded, so very *slow*, dear Mrs Agnew.'

'Yes, there are better things than marriage,' Miss Rae Brown asserted. 'I pity the average wife, who is nothing more than an upper servant, yet she receives no regular salary.'

'True,' said Mrs Richards.

'Wives and wages, indeed!' Mrs Agnew shook her white curls indignantly. 'Had you remained single, dear Polly, you could have earned wages as a good housekeeper while your health lasted. Wages soon vanish with health. But you chose marriage freely for your own good, and now your cry of martyr invites my sympathy. Fie, fie!'

Mrs Richards drew herself together and flew a red flag in each pretty cheek. 'I might be a schoolgirl,' she muttered.

Then Miss Rae Brown came to the rescue. 'Dear Mrs Agnew,' she began, 'the world changes, you know, and we young women change with it inevitably; and our hearts bleed when we see the dull, hollow, sordid existence of the ordinary middle-class housewife.'

'Ordinary fiddlestick! I've known a great many married women and a good many wives. The married women form three classes: those who cannot spend with thrift their housekeeping allowance; those who refuse to accept with care and tact the social position which their means should enable them to keep up; and, again, those who pretend that their real home is society, and that they haven't time enough to manage their own house affairs. It is so much easier for them to employ servants to do their work.'

'Common-sense too,' said Mrs Lynch. 'How can a wife be pretty if she works?'

'I spoke of married women, my dear, not of wives,' replied Mrs Agnew. 'Wives are thorough housekeepers and excellent mothers. They believe, with Napoleon, that the destiny of children is

always the work of women; and the destiny of children is the future of all nations. True wives govern the world, and the bad ruin a civilisation. There's my creed as a neolithic Englishwoman. If I had my way, a cathedral church should be built to the wives of England!'

The young women glanced at each other awkwardly. They might have been as ill at ease had they seen the Primate in the act of playing golf in a London square with the President of the Board of Trade. Their notions of rightness had been upset by something unusual, unexpected.

'The weather is almost mild to-day,' said Mrs Richards in a flurry, after a long pause—'so mild, indeed,' she went on, 'that this morning I wasn't afraid to enter the bathroom. Recently the bathroom has made me shiver.'

'And no wonder,' said Mrs Agnew. 'The modern bathroom is cold as ice in winter. How often is it large enough for a fireplace, and why should its window face north or north-east? As a training for Arctic explorers, or for persons who wish to be inured to the influenza, the modern bathroom may be useful.'

'It has faults, I admit,' said Miss Rae Brown; 'it ought always to be kept warm by a towel-rail heated with hot water from the main boiler, or the hot-water tank should be put within a good linen-cupboard in the bathroom. That I gladly admit; but in *your* time, of course, there was no bathroom at all. How did people live before bathrooms were introduced?'

'They never bathed,' Mrs Lynch believed.

Yet Mrs Agnew chuckled to herself with great satisfaction, as though she had found a Georgian gold piece in her linen-cupboard. 'Yet we did live then,' said she, 'and I'm still content to do without a bathroom. I take my bath by my own fireside, and never in my life has it given me a chill. To think of using a bath which is common to a whole family, *that* I don't like at all; the idea seems unclean. Besides which, the common bathroom is needed at the same time every day by several persons, who seem to play at hide-and-seek to get to it. Half-a-dozen doors are ajar at the same moment precisely, half-a-dozen noses begin to show themselves, and then there's a sudden rush from one bedroom, followed by the noise of a banged door and a running tap. The bathroom's occupied, and one person's happy; but the others are aggrieved, and nurse a grumpy mood till breakfast. That's the comedy of the bathroom.'

'How screamingly funny!' cried Mrs Lynch. 'Fancy bathing in a hand-bath, like a duck in a tea-saucer!'

'A tub in each bedroom would drive housemaids to distraction,' said Mrs Richards. 'Oh! think of the complaints, dear Mrs Agnew, the incessant grumbling; and many ceilings would be spoilt, for most of the water would be poured on the floors.'

'Dear, dear!' said Mrs Agnew, 'you seem very much afraid of your women-servants. I'm not in the least frightened of mine, and they don't scold me much either. When they are useful servants and threaten to give notice, I take great interest in their new caps and dresses, praise their good taste, ask after their fathers and mothers, and prescribe for rheumatism if any parent has a creaky limb or two. Then, somehow, the notice has no effect at all. It's just forgotten.'

'What patience!' cried Mrs Richards, poking the black poodle with her umbrella.

'Modern servants don't expect such attention,' Miss Rae Brown asserted airily.

'That's why they like it when they get it,' said Mrs Agnew. 'Women are women all through, my dears, in all classes. Give them what they expect, and *your* realisation of *their* expectations will be a failure; but they are charmed if you take 'em by surprise. They are astonished by your thoughtful kindness, and delighted, as I was by your birthday flowers, my dears.'

'It's ripping that you are pleased,' said Mrs Lynch. 'I love happy surprises myself, but my servants are suspicious if I pay them attentions. They wonder what I'm getting at, I suppose.'

'Strange!' said Mrs Agnew. 'My servants are apt to be too much attached to me. I said to one, "Mary, I can't keep you any longer; there's no more need of you." And she replied, "But I've need of you, ma'am; I should be lost without you after these years and years." And so I had nothing to reply.'

'Impudence!' said Miss Rae Brown.

'No, no,' replied Mrs Agnew; 'it was the voice of long service. Perhaps we do wrong when we keep a servant for many years. She takes root in our ways of life, and that means a heavy responsibility. And there's yet another point. Guess what it is?'

'I give it up,' said Mrs Richards, rising to take leave.

'Well, my dear, women act as women in their intercourse with each other. A mistake. You should play a part with your servants, and do what good men would do in your position. See?'

'I don't,' replied Mrs Richards.

'Nor I,' said Miss Rae Brown.

'Then here's an example,' said Mrs Agnew, holding out her hand in farewell. 'Women criticise on the spur of the moment, rapping out their discontent at the most inopportune moment and before listeners. That's nerves. They wish to relieve their own feelings, no matter how much they may hurt another person's self-respect. If you treat a man like that there's unhappiness; if you treat your servants so they rebel, and you deserve to lose them. So there!'

'A cruel parting blow,' said Mrs Richards lightly; but the black poodle yelped.

# LAURISTONS.

By JOHN OXENHAM,

Author of *Barbe of Grand Bayou, Giant Circumstance, John of Gerisau, Great-Heart Gillian*, &c.

CHAPTER XVII.—*Continued.*

IN the first place he met his sister Charlotte, stricken and anxious, and shaken for once out of all thought of herself. She was waiting for him at the stairhead, leaning over the broad oaken top of the balustrade, and looked as though she might have been there ever since she sent off her messenger.

'Oh Charles!' she gasped, and swayed as she rose from the balustrade.

He caught her in his strong hands, and led her into her own room and closed the door.

'How is he? What does Berkeley say?'

She shook her head with a sob. 'He says father may not live through the night.'

'Where is he? In his own bed?'

'Yes. He had Mr Pennefeather with him all the morning'——

'Pennefeather?'

'And it was just after he had gone. I heard him fall, and I ran in. Dr Berkeley was here within half-an-hour, and has been with him ever since.'

'And John Sax?'

'He is in there too.'

He kissed her forehead and went quietly out. There had never been any very great communion between them, but trouble breaks and binds.

He tapped very softly with his knuckles on his father's door. John Sax opened it gently, and Captain Charles started at sight of his face, at once so grimly set and warped was it. It set him fearing the worst, but his deepest thought never plunged within touch of what that might be.

John Sax came softly out.

'How is he?' asked Captain Charles, with the great fear at his heart.

'He is going. It is very terrible. He is conscious, but he can neither speak nor move, except his eyes, and they—oh, it is dreadful!' and John Sax covered his own haggard eyes at thought of them. 'He wants to speak,' he continued, 'and is trying to all the time, and cannot. I told him they had sent for you, and he blinked as if he had wanted that.'

'Perhaps if he sees I am here it may satisfy him.'

'Yes, I think you should go to him at once.' And they went softly in.

Dr Berkeley nodded a solemn greeting. Charles gathered the worst from his face.

His father's rolling eyes met his at once, and a look of satisfaction came into them—if that could be called satisfaction where all was anguish and revolt at this fettering impotence.

It was terrible to see him so, as John Sax had said, and to be powerless to ease him in any way.

A great desire was in Charles's heart to comfort him somehow, but he knew not what to do or wherein comfort and easement might lie. He bent and kissed the damp forehead, on which the sweats of agony had plastered some locks of gray hair.

'It breaks my heart to see you suffering so, father! Is there anything I can do?'

The straining eyes rested on his in a dumb agony of appeal under which it was impossible to remain quiet. It was the pitiful look of the gagged and bound victim of the vivisector's knife, when the anæsthetic has passed and the cruelty still goes on—wildest fear, horror, impotent agony.

There are beings who can witness these things without a pang. I hold them lower than their victims, for they have lost their God-given attribute of pity, and can never regain it in full. And think what you may of Charles Lauriston in the end—condemn him as you must on some counts—he was at all events ever thoughtful and considerate for all about him, and especially those who suffered, from their own faults or others'.

His heart was wrung at sight of his father's suffering. It quickened his perceptions to the penetration of the prison-house. He saw that his father understood what was said to him, and that much of his furious distress lay in his incapacity to answer.

He bent over the pent-up soul and said quietly, 'You want to communicate with us, father. Will you close your eyes once when you mean "yes," and for "no" keep them closed for a moment? Do you understand?' And the dumb, striving, bloodshot eyes closed and opened quickly, and there was somewhat of relief in them.

'Is it myself you want to speak to?'

'Yes,' signalled the troubled eyes, and then rolled meaningly on Dr Berkeley, who was speaking in a murmur to John Sax by the window.

'You wish us to be alone?'

'Yes,' but to Captain Charles's anxious eye not so immediate and unequivocal a 'yes' as before.

'Shall John Sax stop also?'

'Yes,' with a quick look of relief.

'I will see to it.'

He went across to the others.

'He wants to speak to you, Mr Sax. If you will ask him about anything you think he may have on his mind he will answer you "yes" or "no." "Yes" is one blink of the eyes; "no" is eyes closed. It will be a relief to him.'

'That is a great gain,' said the doctor.

'Perhaps you will favour me with a few minutes in the next room?' And they went quietly out.

'Now, what is it?' asked Charles. 'My sister says you fear the worst. A stroke is not necessarily fatal, is it?'

'There is more than an ordinary stroke here, Captain Lauriston. It is impossible to say yet. But he is visibly sinking. It looks like a sudden and complete collapse. He has always looked hale and hearty, but there may have been mental and physical tension of which we know nothing.'

'I am not aware of anything out of the common,' said Charles thoughtfully. 'Business in these days is no bed of roses, of course; and he is well on in years, and has always kept a great deal in his own hands—too much perhaps.'

'It looks like it; and now he is paying for it, and maybe wishing he had not.'

'You have done everything possible?'

'Everything. We can do nothing now but wait.'

'And how—when—may we look for any change?'

'I doubt very much if he will last through the night,' said the doctor gravely.

'Can you wait, or have you others'——

'I will see him again now. Then I have two or three others I must visit, and I will return in the evening. There is a good deal of sickness about. One does not get much time for rest nowadays.'

They went softly in again; and John Sax stopped abruptly in some low-voiced question he was putting to the stricken man, who seemed quieter and more resigned to the inevitable. The power of communication had evidently given him relief.

'We are going on as nicely as could be expected,' said the doctor, smoothing the furrowed brow with a cool, firm hand. And the worn eyes fixed themselves upon him with infinite knowledge.

'I will return shortly, my dear old friend. Don't worry about things. Rest makes for healing.' And Captain Charles went down the stairs with him.

'He has no hope himself,' said the doctor. 'I see it in his eyes. I fear you must prepare for the worst.'

*(To be continued.)*

# THE RIVER AMAZON.

HILE the Amazon is the world's greatest river, if not in length, at least in the volume of water which flows through it, it is the world's strangest river as well. The few travellers and explorers who have journeyed up this watercourse to its many sources in the glaciers of the South American mountains tell stories which are almost incredible about the literal maze of streams which unite to form it, each stream having its birth in one of the great ice-masses. Yet a few hundred miles below, where they merge and create the river, the temperature is such that it works its way through a perfect labyrinth of tropical vegetation.

Only the mariner can tell the place where the Amazon really has its mouth, because the opening it has made on the eastern coast of South America is so wide that it extends over one hundred miles. A long distance before one comes to the mouth of the river, however, one is really sailing on the waters of the Amazon, because they force their way so far out into the ocean. They say that three hundred miles out at sea, off the mouth of the Amazon, you can hoist a bucketful of fresh water out of the ocean from the deck of a ship, such is the quantity of its water that flows from that gigantic basin. Long after you have entered the actual river, and have its banks to north and south of you, if you are in mid-stream you will still be out of sight of land, such is the breadth of the vast channel. The river stretches far into the ocean and far up the country. Take a map of South America, and look out a place called Iquitos. It lies four-fifths of the way across the continent from east to west. Yet from Iquitos there is a fortnightly service of ocean-going steamers to Europe, which descend some three thousand miles of the river before they reach the sea. It is not only one branch of the Amazon, but many, that are thus to be regarded as the same as ocean highways. The southern branches of the Amazon are broken by rapids along a line where a low continental shelf exists. Above these rapids, however, there is again deep water. Thus beyond the falls of the Madeira there are over ten thousand miles of navigable water on that river and its branches, and these only await the making of a short railway, less than two hundred miles long, to be brought into connection with the other highways of the world.

Most of what we know about the upper region of the great river is due to an article of which we use so much in daily life—rubber—in footwear, coats, and other garments to protect us from the rain and snow; fashioned into handles for knives, forks, and other instruments of daily use; and turned into hundreds of necessary things. The world has been searched for the rubber-tree, but it grows in so few forests that most of the crude rubber comes from the gum which is drawn from the woodlands of the Upper Amazon. In these forests grow the trees which yield the finest quality of rubber-gum.

To obtain the rubber, little bands of white men have spent years in exploring these almost unknown forests, often cutting their way mile after mile through tangles of vines which so interlace the trees that every ray of the sun is shut out and it is almost as dark as night. Sometimes they cannot go on foot, but must work their way along in frail canoes, as the rubber-tree is often found in what might be called woodland lakes, rising directly from the water. Most of the steamships which sail far into the heart of South America carry rubber as the most valuable part of their return cargoes, bringing it not only to Great Britain, but to France, Belgium, and Germany, where the huge, dingy brown balls into which the

gum is pressed are made into articles to supply many human needs. So much of the rubber is taken from the forests of the Amazon that explorers are continually going farther and farther into them in search of more of the rubber-bearing trees, and it is owing to their explorations that much of the mystery of this great region has been revealed.

Probably Sir Martin Conway, the noted world wanderer, is more familiar with the head of the Amazon than any other white man. This is what he says about the actual sources of the Amazon:

'The sources of the Amazon are of course countless. Like the web of a gigantic leaf, its tributaries divide and subdivide into an infinity of threads at the outer fringe. Some, perhaps almost the remotest of these from the mouth, I have myself visited where they quit the glacier tongues of the great snowy Cordillera Real in Bolivia and Peru. Those glaciers themselves are in fact branches of the great Amazon, and to it each snowflake belongs that falls within its watershed.

'Great are the snow reservoirs on the roof of the Andes; but the streams that flow from them are far smaller than those yielded by Alpine glaciers, for the equatorial sun does not so much melt as evaporate the ice. Glacier rivulets are they, rather than torrents, that are the loftiest affluents of the Amazon. I have stepped across many of them, and the broadest were easily leapt over. By their union, however, torrents are formed which swiftly tumble into deep gorges—gorges with desert banks on the sides of Illimani, into which the most vertical sun pours a blistering heat. A few miles lower down all is changed, and the stream enters a fertile, hilly region, like the Italian foothills of the Alps, only more luxuriant for vegetation—the home of monkeys, birds, and butterflies innumerable. Through these foothills the river, now as large as the Thames at Chelsea, makes its way by rapids and swift stretches of smoother water. Here navigation is carried on by rafts made of light tree-trunks, skilfully handled with the skill of ancient tradition by the aboriginal Indians. While one is still among the foothills, the region of boat-navigation is reached. Here and beside the rapids is the upper limit of the great india-rubber forest, and the trees are now tapped which stand within reach of navigable waters. Not more than two or three hundred miles away from the crest of the Andes the foothills cease, and the edge of the great Amazon plain is reached, stretching thence some three thousand miles away eastward to the Atlantic seaboard.'

Away in this remote part of the South American continent Nature has been indeed generous, for in addition to the wealth of rubber there are known to be deposits of gold and other precious minerals. It is said that nearly every one of the glacial streams washing down the foothills of the mountains carries sand laden with gold which has been accumulating in its bed for centuries, but as yet none has been secured by the miner, owing to the distance to these streams being so great, and to there being no route by which machinery or tools for getting the gold can be taken to these places.

Not only Sir Martin Conway but other travellers who have ventured along the upper river and its tributaries say that here a curious earthly paradise really exists. To the surface of the water the sun's rays seldom reach; and, as already stated, one may go many miles along waterways where it is well-nigh as dark as night, because the sky is almost completely shut out by the mass of vines which interlace the trees and are so thick with leaves. Deprived of the sunlight, all is dark and rank. The damp air is laden with unhealthful vapour; the surface of the water, in places where the current is too sluggish to carry it away, is covered with scum and weed. It requires no little courage to explore these fastnesses, for a man really takes his life in his hands, so unhealthy are they. Occasionally, however, one can see the upper portion of the forest where there is a little crevice in its roof of vines. Above this is really a scene of life and beauty. Birds and butterflies and other gorgeous insects are flying from place to place; flowers of hundreds of hues and shapes are blooming from the plants attached to tree branch and trunk. While below all may be lifeless and silent, above the height where the mass of vines overshadow the river Nature has created a world of brightness and animation; but, as already stated, it is almost entirely shut out from the human eye. To attempt to break through this canopy of vines which hide it from the lower world is almost impossible, because the vines grow so thickly; but some naturalists have penetrated it, and say that the forests really have two surfaces, the one above this artificial roof and the one below. That which is above is barred from human entrance. Its inhabitants are mostly birds and insects that are radiant with beauty unequalled in the world. Whatever grows in the Amazon mud strives with desperate internecine struggle to reach this sky-exposed surface, and there blossoms. Beneath, where man can walk or float, all is dark; only here and there a fitful ray of sunlight struggles through. Orchids blossom within this shadowy region. But it is above, where man can seldom go, that the glory of colour reigns supreme—colour of flowers, of butterflies, of birds, radiant in scarlet, in gold, and blue. You can see these bright creatures fitfully in the cavern below, but not in all their glory as they must behold one another above. Sometimes, as they flit about beneath, they will chance to cross a sunbeam slanting through a hole in the vegetation; then for an instant they flash into view like an explosion of burning colour. It is thus that the great butterflies are seen to the best effect. No one can imagine what a picture they produce in their native haunts as their wings flash and close and flash again in the sunlight as they fly.

No, this upper world of the Amazon forests has been closed to human beings, and promises to remain a perpetual mystery unless with the aid of some aerial craft one may be able to visit it.

# LOST AND FOUND.

## A REMINISCENCE OF THE BOXER RISING.

'WELL, it's not exactly palatial, is it?' said Graham with a grim smile.

We were sitting in the filthy guest-room of a crowded Chinese inn as he spoke, endeavouring, in spite of the stifling heat and clouds of mosquitoes, to do justice to an unappetising meal of dried fish and rice. From the noisome courtyard without rose an unceasing din and clamour, dozens of curious eyes watched our every movement from the gaps of the paper walls, while the scampering of the rats above threatened each moment to bring the crazy ceiling about our heads.

It was, as Graham said, scarcely palatial, and the discomforts were none the less apparent after twelve hours in the saddle under the burning sun of Central China. We were on our way to a remote Hupeh mission-station on the Yangtse, and in order to avoid the tedious river-journey from Hankow we were travelling overland, disguised, for the sake of economy and convenience, as Chinese merchants.

The year 1900, of which I am writing, was no safe one for Europeans in China. That mysterious 'Society of Harmonious Fists'—or the 'Boxers,' as they are generally called—which was aided and abetted by the highest in the land, and planned at the instigation of the late Dowager-Empress herself, spread with such rapidity through the country that from Peking to Canton and from Amoy to the western provinces the life of every white man, woman, and child was threatened; but more particularly the lonely missions, stationed far from outside help and trusting with implicit faith in the loyalty of their converts, were in great danger.

Engrossed as the attention of England was in the South African war, but scanty notice was taken of the rising until it culminated in a hideous catastrophe—the siege of the Peking Legations and the dead of the allied nations in Pechili province.

The particular mission to which we were travelling was conducted by an elderly gentleman, who had been assisted for the last two years by his young niece. Although the harvest of converts was by no means abundant, yet they alleviated the distress and poverty of the inhabitants by many a kindly act of charity. Graham had known old Mr Mason for many years, and having been in a position to render some service to him in the early days of his occupation, was a welcome guest at the mission-house whenever his travels through the country led him in that direction. It should be said that Graham was in the Consular Service of China, and, incidentally, my very good friend.

Events which have nothing to do with this tale had reunited us after an absence of nearly seven years; and partly from his wish to show me the country, and partly for reasons which I was to know that evening, we had undertaken this inland journey.

The long summer day was drawing to an end, and the shadows were lengthening on the dirty floor; caravans were arriving for the night, and in the courtyard rose a deafening clamour of voices.

Graham, who had been sitting a long while silent and moody, kicked savagely at an inoffensive spider. 'Sometimes I hate this accursed country,' he broke out suddenly. 'I loathe the dins and stinks and the pestilential crowds. It gets on one's nerves at times.'

'Why don't you go home for a spell?' I said, knowing that he had much leave due to him. And then I added, 'Come back with me; we can rent a small place in the country, and shoot and hunt and live like princes.'

He did not reply at once, and when he did speak it was to make a startling statement. 'I ought to have told you before,' he said hesitatingly. 'The fact is—well, the last time I was up at the mission I asked Margery Mason to be my wife.'

'My dear fellow'—— I began.

But he cut me short with an impatient gesture. 'It's no case for congratulation; at least, not yet. You see, there's something that has to be cleared up before there's any question of an engagement. Do you remember the *Iconoclast* incident?'

'No.'

'Well, some five years ago a British cruiser, the *Iconoclast*, was lying in the Woosung River, and one night one of her officers completely vanished, and was never heard of again in spite of the most strenuous efforts on the part of the authorities. The matter was hushed up at the time, as his disappearance was synchronous with the appropriation of the wardroom funds; so, you see, it was a bad case.'

'How does that affect you?' I asked.

'That officer was virtually engaged to Miss Mason, who was then in England,' he replied quietly. 'She absolutely refuses to entertain the accusation of theft, and believes that he must have met with some accident which precluded his returning to the ship. On the death of her mother she came out here to her uncle, hoping to find among these four hundred millions of people some one who will clear all guilt from his name. Naturally I had never connected her name in any way with the story until three months ago, when I was last up at the mission; but during a week in Shanghai I was able to make many secret inquiries in the native city. It's wonderful what one can do with a knowledge of the natives, even after five years.'

All was quiet in the courtyard at last; night had come, and the bright stars that the East alone can give were twinkling in the stifling darkness.

Graham drew a candle from his gown, placed it

on the floor, and lighted it. 'For instance,' he continued, 'I have the evidence of the sampan-man who took him ashore that night from the *Iconoclast*, and the innkeeper in the native city in whose place he disguised himself as a coolie confessed at last that he had much money with him. God knows what devilry he was up to after that.'

'And you will use these evidences?' I asked.

There was silence in the room for a while until some one started a high-pitched Chinese song.

As the quavering notes died away to silence Graham answered my question. 'No, I think not. I can't tell her the man's misdeeds. She must find out for herself, and until then all our dreams of country-life in England must wait.'

With that we dropped the subject; but it was impossible to sleep, and so we sat far into the night, two bespectacled, pig-tailed Chinamen, talking of the English Channel and the South Downs and the Sussex Hunts, until the guttering candle spluttered out in the darkness.

The next evening we arrived at our destination, and in the mission premises within the city walls I was introduced to Mr Mason and his niece Margery.

It was impossible not to notice the trend of affairs. Not only had our short ride through the city (which we had entered in English clothes) been marked by more than usual hostility, but the anxiety and suspense were plainly visible on the faces of all the inmates of the mission.

'My uncle keeps assuring me that nothing is wrong,' said Margery after the greetings had been exchanged and Mr Mason had retired again to his studies; 'but he has forbidden me to go outside the house, and seems very sad and depressed.' The pallor of her face and the dark circles round her eyes showed clearly how the enforced confinement in that pestilential city was telling on her constitution.

We made light of her fears, saying that it was the old cry of 'Wolf, wolf!' and that the *taotai* of the city would see that no harm came to the mission; that the Union-jack was flying over the British Concession at Hankow, and that there were British gunboats on the Yangtse.

We did not then know that the allied nations were massing at Tientsin, and that the siege of Peking had begun. Nevertheless, in spite of a peaceful night in our comfortable quarters, we rose next morning haunted by a strange oppression—a vague foreboding of future events. It was a dull, stifling day, and it seemed as though anything could happen in that still, sultry atmosphere. But the usual routine of the mission took its accustomed course; throughout the long morning there was no outward and visible sign to give ground for our anxiety, and after *tiffin* Mason left in his 'chair' on a visit to a house at the far end of the city.

It must have been about five in the evening when the curtain rose on the first scene of the drama. Graham and I, having discovered the half-dozen rifles insisted on by the home authorities, were engaged in cleaning these on the veranda, when suddenly the mission bearers, dusty and streaming with sweat, came staggering into the compound.

Looking very white and aged, and binding his right hand in a blood-stained handkerchief, Mason descended from his 'chair' and came to where we stood. 'You can expect the worst,' he said. 'I'—and his voice broke a little—'I was stoned by a mob in the city—the first time in twenty years.' And he passed into the house.

Exchanging a look, my friend and I continued to clean the rifles.

Dinner that night was not a pronounced success, in spite of an avoidance of the topic that was uppermost in our minds.

To his niece the old missionary had made light of the affair, saying that it had only been the disturbance of a few roughs, such as might have happened in any town in England. However, as we retired with our cigars to the veranda we at once held a council of war, and out of the hearing of the girl he loved, Graham strongly urged our host to send to the *taotai* for help. 'Is there any one among your servants whom you can trust implicitly?' he asked.

The old gentleman reflected an instant. 'Yes, Wang—the only one, I fear.' The words cost him an effort. To claim only one faithful retainer after twenty weary years of hardship and privation must have been a bitter confession indeed.

The house-boy Wang, an intelligent-looking Cantonese of indefinite age, was accordingly sent for, and despatched to the Yamen with a message carefully drawn up by Graham and the missionary.

Occupied with our own thoughts, we sat silently smoking and waiting for the next turn of Fortune's wheel.

'Look out!'

A Chinaman had crawled into the compound and lay within a few feet of our chairs. We sprang on him in an instant; but he offered no resistance, and addressed our host rapidly in the vernacular. Unconversant with the language as I was, I watched him as he stood pleading vehemently before Mason. He was apparently a coolie of the poorest type, pinched with famine and wasted by disease and opium; and I remember thinking that he seemed to represent the summit of poverty and misery, the last word in degradation.

Graham translated to me. 'He says they are going to attack the mission; but if we come at once he will take us down to Hankow in his junk.'

The Chinaman stood watching him expectantly as he spoke; then their eyes met, and Graham continued: 'It's probably a trap; and, besides, not one of us could leave the city alive to-night.'

I was about to answer, but at that moment Margery Mason entered the veranda.

There was an instant's pause; and then an involuntary sob, more like the cry of an animal in pain than anything human, was wrung out of our strange visitor, who was leaning forward with a

ghastly pallor on his face, his hands gripping the wicker chair like a vice.

The girl crossed over to Graham: 'What is it, Gerald?' she asked.

Our eyes were turned to the Chinaman, who, trembling from head to foot, commenced a pitiable, confused jargon of English words. It was impossible to distinguish anything clearly, but I caught the words: 'England—Margery—God—another chance—lieutenant—Royal Navy.' It was an unparalleled, unheard-of situation. I, for my part, knew not what to make of it until, with a start of horror, I suddenly remembered the *Iconoclast* incident.

Mason was the first to break the silence which ensued. 'What is this?' he asked. 'Explain at once.'

The dreadful suspicion which had entered my mind was gradually confirmed as, slowly and haltingly, in the almost forgotten words of his mother-tongue, the poor wretch told us one of the saddest tales I have ever listened to: how as a lieutenant on the *Iconoclast* he had run into debt ashore, and one day had taken opium to ease his anxieties; how the drug had taken a grip on him so that he scarcely knew how to exist between the doses; and how, with all his principles gone, and broken in mind and body, he had finally yielded to the craving, and had slipped ashore one night in a sampan, taking the first money he could lay his hands on.

We heard the story through in silence, sitting mute and abashed like the unwilling recipients of some disgraceful confidence.

The awkward pause which followed was suddenly broken by the unceremonious return of Wang, who, running on to the veranda, leant over Mason's chair and jabbered quick, short sentences into his ear.

Mason translated quietly. 'The *taotai* is sleeping and cannot be disturbed. The Yamen runners beat Wang out of the courtyard. They are selling the Boxer-sashes in the city.'

With something akin to relief we heard the news, for it was at least definite. The *taotai* was obviously hostile, and we must go farther afield for help.

Miles down the great river lay the treaty-port of Hankow, and a British river-gunboat which was lying off the Bund must be summoned to our relief. We discussed the selection of a messenger. The few native converts huddled together in a back room were useless; any one who could use a rifle was indispensable for the defence of the mission; so our eyes were turned again to the faithful Wang.

Hurriedly Graham gave him his instructions. He was to try his utmost to creep out of the city that night, and, if that were impossible, to wait hidden until the gates were opened in the morning; to make his way with all speed down the river, and take a written message to the commander of the gunboat. So he departed—a slight figure, stealing noiselessly across the compound, in whom were centred the hopes of the mission.

Then we turned our minds to the fortification.

Now it so happened that the mission quarters were peculiarly adapted for withstanding a siege, as the back of the house abutted on to the city wall, while in front lay the broad, open compound, which would have to be crossed by an attacking party.

The matter of vital importance was the strengthening of the veranda frontage, and this we effected by means of a carefully erected barricade of anything we could lay our hands on; a quantity of flour-bags formed the foundation, and among these we left occasional loopholes through which to 'snipe' in comparative safety. Of ammunition there was an alarmingly small supply, and indeed only a moderate amount of food; in fact, our only advantage lay in a large consignment of *tansan* water which had but lately arrived.

We worked hard with the aid of the native converts, and about midnight we rested from our labours; the barricade had been built along the veranda, the ammunition divided, and buckets of water stationed at intervals in case of fire.

The ex-naval officer had sat silent and moody throughout the long work of preparation, with his head buried in his hands. Graham gave him a rifle. 'You must play the man to-night,' he said.

The poor fellow appeared utterly broken; but as soon as his hands closed on the rifle and wandered over the breech and bolt and barrel, all the old influences—good, strong influences of the *Britannia* and the Senior Service—strengthened him into a man again.

'You can trust me,' he said simply.

We divided the watches—two hours on and two hours off, and the man on duty was to call the others at the first sign of alarm.

Just as the eastern sky was paling and the deadly malarial mists were rising from the Yangtse River, I roused Graham and turned over in a dreamless slumber. I seemed to have slept for about a minute when I was awakened by a sharp report, and on looking up, saw Graham ejecting a cartridge.

'Wake up,' he said; 'they've begun the ball. That's one to me.' A quivering yellow body lay in the centre of the compound.

Four more desperate rushes were made before the slanting rays of the sun peeped above the city wall, only to end in a disorderly rout, with the dead and dying left in the open.

And then followed a dreadful calamity.

The old, white-haired missionary, who had insisted on keeping his watch and taking his place in the firing-line, suddenly collapsed in the last stage of exhaustion; the exposure in the deadly night-air, together with the heart-breaking events of the last few hours, had proved too much for his wasted frame, and he lay behind the barricade on the point of death.

Gently we carried him inside and laid him on the couch, and there, in the little room where he had laboured so long and patiently, he breathed his last and passed into the unknown Beyond.

The sun by this time had risen in the deep dark-blue of a summer sky, and the burning rays were already taking ghastly effect on the corpses in the compound. And Wang could not yet have reached Hankow! Ill-satisfied at the result of their rushes, the Chinese rabble began to adopt other tactics. A few rusty jingals had been apparently discovered, and these were being loaded with great precaution.

Now a few jingals in the hands of a Chinese mob are not necessarily very dangerous, and provided you are not scared by the deafening report, and can take cover from the hail of bullets, the material damage need not be very serious; but in this particular instance the jingal marksmen mounted the walls of the compound, and were thus able to fire down on the veranda, so that while our attention was concentrated on them the others could rush the compound.

In this way we suffered another casualty. We three defenders were endeavouring to silence a few ambitious marksmen whose fire was becoming quite unpleasantly accurate, when suddenly a villainous-looking crowd, wearing Boxer-sashes and armed with spears and knives of every description, came rushing into the compound and were within a few feet of the barricade before we had time to divert our fire. The next moment we sent a volley of bullets into their midst; three fell mortally wounded, and the rabble retreated in confusion, with the exception of their leader, a hideous, powerfully built ruffian, who kept on his headlong rush to the veranda rails.

Now Margery—who, although terribly distressed by the death of her uncle, had kept a brave front and shown an excellent example to the defenders of the tiny fortress—was at this moment under the shelter of the sandbags attending to one of the wounded converts, when just above her appeared the threatening spear of the Boxer leader. Lying prone as we were, it was impossible at first fully to realise the dreadful situation; but in a flash her one-time lover threw himself forward and received the full force of the weapon in his bare chest. The next instant the Chinaman fell back into the compound with two bullets through his shaven head.

We saw at once that the other would never recover. The broad-bladed, rusty spear had inflicted a terrible wound, and the poor fellow was suffering untold agonies. Still conscious, he refused to be taken into the house; so, having brought out a mattress and made him as easy as possible in the shelter and shade of the sandbags, we again took our places at the loopholes.

And so it went on all through the broiling day, now repelling rushes, now returning the fusillade of the jingals, until at last the sun sank behind the city walls and night came on with all the appalling suddenness of the East.

And what a night! As I look back it seems one hideous dream: the ghastly stench from the compound—the moanings of the dying man behind us—the sickly moonbeams falling, now on an arm stretched out in agony, now on the upturned face of a corpse.

Suspicion of a night-attack precluded, of course, all idea of sleep; so we remained at our posts with eyes and ears straining for a creeping figure, for the far-off sound of the river-gunboat. And as the night wore on, and all was still, there flitted through the tired brain fantastical fancies and memories, long since forgotten, of youthful hopes and dreams, of other times and other places, of schoolboy-days in England. The light of the dawn found us, haggard and weary, waiting with almost fatalistic indifference for what the new day would bring.

'Land dead ahead, sir!'

The words were spoken with alarming distinctness, but they were the words of a dying man. We left our posts and knelt beside the prostrate figure on the mattress; but the Boxer spear had done its work, and the *Iconoclast* incident was closed for ever. So there were two of us left to defend an English girl, a few native converts, and the honour and prestige of the British Empire.

The attack soon recommenced. First an attempt was made to fire the building by throwing lighted torches; but this we were able to frustrate by means of the buckets of water that had been prepared, and the fusillade began again.

A burning sun, an ever-diminishing store of food, our ammunition almost exhausted, and still no sign of relief. The situation was growing desperate. A well-organised rush would have settled the matter for ever. As we lay there behind the puny barricade, watching our little row of cartridges grow smaller, it is not to be wondered that there came down on us a dull, hopeless apathy, bringing vain, despairful imaginings: Wang had been caught in the city and the relief would never come; the whole British Empire was a myth; there was no such place as Hankow; there were no such things as gunboats; there was only the glittering foresight of a rifle and a horde of yellow, naked bodies in a sun-baked compound!

*Toot—to-oot!* The long-drawn wail from the river was succeeded by a dull report. I lay there wondering vaguely at the fresh trend of events until I became aware that Graham was tugging at my sleeve.

'That was the gunboat's siren,' he said hoarsely; 'and they 're using their three-pounder on the gates.' And he went on with his good news.

Slowly at first as the gunner ranged, and then with deadly insistency as he found his mark, the three-pounder shells came screaming in from the river. A faint cheer told us that the breach had been made, and then the gates which had survived all those countless generations of yellow faces collapsed in a mass of bent and twisted metal.

We heard the short, sharp bark of a service revolver; we saw the Chinese scattering in the narrow streets; and the next instant, in a flash of colour, a party of bluejackets, headed by a young sub-lieutenant, came doubling into the compound. And

so it was all over. The mission was saved, the three-pounder was layed on the Yamen, and Wang was the finest Chinaman that ever lived.

'We got your message yesterday afternoon, and started up-stream at once,' said the sub-lieutenant, replacing his smoking revolver. 'Guessed you 'd be having a warm time.'

Leaving the Lewes main road on the right, a little below the village of Berwick, you follow a leafy, wooded lane until you come to the gates of a fine old English mansion, standing in pleasant, park-like country, and looking out over the Sussex Downs. Any villager will tell you that it is the home of Sir Gerald and Lady Graham.

## A FLOATING LIFE-SAVING STATION.

TO the traveller who approaches the coast of Britain the neat white houses and walls of the same hue form indeed an attractive sight, even though the tourist may not be aware of the humane purpose for which they have been placed there. He sees them sometimes miles from any other human habitation, some on rock-ledges high above water, others in little valleys which stretch down to the sea.

This feature so familiar to the coast of Britain is absent in the United States, but along the Atlantic and the Pacific coasts are what the Americans call life-saving stations. They are exactly what their names imply, and the men who occupy them do not have to look out for smugglers, as this duty is performed by another department of the Government service. The coast of the United States in many places is extremely dangerous. For instance, Cape Hatteras, the long, low point which projects into the ocean from the coast of North Carolina, has been called the 'Graveyard of the Atlantic' because of the many vessels which have been cast ashore or sunk at this place by the gales from the Gulf Stream, and by the dangerous currents which sweep along the shore in this vicinity. Cape Flattery, on the coast of the state of Washington, has been called the 'Graveyard of the Pacific,' and is probably the most dangerous point on the seaboard of the United States, for the reason that it is a bold, rocky eminence reaching out into the ocean for several miles; it is not far from the narrow strait which forms the entrance to Puget Sound, and through which all ships going to the principal seaports of British Columbia, as well as of the state of Washington, must pass. What is called the Japan Current, an ocean-river which flows southward, comes close to the shore at this point, and, mixing with the colder water of the sea, causes fogs so dense that the pilot may not be able to see beyond the bow of his vessel. This part of the Pacific is also noted for its violent storms, while the tide often rushes into the strait with waves fifteen or twenty feet in height. Consequently the utmost care has to be exercised by the mariner whose ship plies in this part of the Pacific, and it has a dark record for the number of lives lost and vessels which have been dashed to pieces on the rocks or stranded, and their crews either drowned or possibly frozen to death in the winter gales.

It is a locality where the American life-savers have great difficulty in trying to perform their duty, as there are many storms so violent that it is impossible to launch a boat from the shore, while a ship in distress may be so far out on the ocean that the life-gun which is used by the rescuers for shooting lines to the vessel and hauling the crew to safety is of no use. An instance of this kind occurred only two years ago, in a January storm, when the passenger-steamer *Valencia* was wrecked at the entrance to the strait. For two days the fated vessel lay on the rocks, but the waves ran so high that it was impossible for the people on board to be reached. Finally she was literally knocked to pieces, and of the one hundred and thirty-six persons comprising the passengers and crew, not one was saved. Probably more lives have been lost in these dangerous waters than off any other harbour of America, for the record is nearly seven hundred within the last century.

The disaster to the *Valencia* caused the American Government to consider plans for preventing further loss of life, and for aiding vessels which might be in distress off this shore. The result was the construction of a little craft which is probably the only one of her kind in the world. There are passenger and freight carriers, the small lifeboat which is rowed or sailed from the shore such as the coast-guards and the American shore life-savers utilise, and the craft for towing vessels and for many other purposes; but this boat has been well called a floating life-saving station, since she was designed and constructed entirely for the relief of seamen in danger or distress. True, she is so staunchly built and so powerful that she can tow a hulk much larger than herself to a place of refuge; but she is intended especially to take crews from ships which are sinking or may be in danger of sinking, or have grounded where they may go to pieces. This means that the *Snohomish* has an arduous and dangerous mission, for she must be at sea in times when ship-captains seek the nearest port of shelter on account of storms. She will be stationed on the Pacific near Cape Flattery, and for weeks at a time will be cruising in these waters, especially during stormy and foggy weather.

The vessel is named *Snohomish* after one of the American Indian tribes who were noted for their skill with the canoe, even venturing far out on the ocean in their fragile boats. They inhabited this part of

America before the white man came, so the name is quite appropriate, as they were what might be called seagoing Indians. In appearance the vessel is not very impressive. Some of the tow-boats which ply on the English Channel and help to dock the great liners and other vessels at English seaports are larger in size, but it is doubtful if any have the same power or are so stoutly constructed. Her hull is entirely composed of massive steel plates, and in some parts is of double thickness. The interior is divided by strong bulkheads or partitions into watertight compartments, so that if by accident one or two of the compartments are filled with water the vessel will still float, as the others will remain free of water. In addition, however, she has powerful machinery for pumping out the water in case she should ship a sea. The framework is as strong as that of an ocean liner, being composed of heavy steel, while her engines have a strength of no less than fifteen hundred horse-power in order to help her to fight against the waves and to be able to ride out storms which would sink an ordinary ship. She is provided with a very large propeller-wheel having four bronze blades, each of which is no less than eleven feet in length. The *Snohomish* contains everything that will add to her safety and assist her in her mission. She is lighted by the electric current and is entirely fireproof. To enable her to be controlled in stormy weather she is steered by a steam-engine, and she has steam-windlasses for winding cables or ropes without human labour.

In addition to a complement of metal lifeboats, the *Snohomish* carries guns for throwing life-lines over a vessel in distress. The crew may be taken off safely even at sea, despite the rolling of either craft, by means of a novel breeches-buoy operated by steam-power. This apparatus is the well-known breeches-buoy used at the life-saving stations, combined with devices for operating and keeping the cable always under an even and safe tension no matter how the seas toss the vessel about. The two special features of this apparatus are an automatic reel which constantly 'gives and takes' on the cable, while maintaining a tension nearly as even and constant as if the vessel were at rest, and a 'down-haul,' by means of which the passengers in the breeches-buoy are safely landed on deck without regard to the boisterous character of the seas. A rustproof cable line of light steel fifteen hundred feet in length is provided. This will permit of the operation of the life-saving apparatus up to more than a thousand feet between the vessels.

The way in which this device is operated is worth describing. If the *Snohomish* sights a vessel in distress she goes within range of one of her life-guns, which carry a distance of over a quarter of a mile, so that she can keep far enough away to avoid a collision even in a heavy sea. The gun contains a projectile to which is attached a small rope known as a whip-line. To the other end of this whip-line is fastened the life-saving cable. Only the whip-line is shot over the wreck. Then the men aboard it haul the cable to their vessel and fasten it to a mast or to some other secure place. This life-line is provided with a pulley or block and tackle, and to it is attached what sailors call the breeches-buoy, which is a combination of a circular life-preserver and a canvas bag which will hold one or two persons. As soon as the line is made fast it is only necessary to get into the breeches-buoy, when the steam-operated machine on the *Snohomish* pulls it to this vessel, its human cargo is unloaded, and it is sent back to the ship in distress. So rapidly is the operation performed that a hundred persons can be transferred from one craft to the other in two or three hours, so that even if a ship is sinking the crew can be rescued in a very short time.

This floating life-saving station has a store of medicines in charge of a government surgeon, cabins where victims who are injured or very ill may be accommodated, and special supplies of food and clothing for use when they may be needed. As already stated, she is provided with cables and towing-machines, and if the ship in distress has not stranded, and there is a port within reach, not only the crew but the vessel may be rescued.

The *Snohomish* is manned by a crew of veteran sailors. She belongs to what is called the United States Revenue Marine Service, but is detailed entirely for this perilous duty. All of her officers have navigated the Pacific and are familiar with its many dangers. As she was built in a shipyard on the Atlantic coast, it is necessary for the little craft to make the long voyage round Cape Horn, and before reaching her station she will have gone a distance of no less than twenty thousand miles—one of the longest voyages on record for a boat of her size, as she is only one hundred and fifty-two feet in length and is not so large as many yachts used merely for pleasure. Her commander is Captain A. V. Levis, assisted by Lieutenant B. L. Brockway.

## EXILED.

Alone I stand beside the sea,
The long waves breaking at my feet;
So breaks my heart anew for thee
With each reverberating beat.

I watch the great ships slowly dip
Below the far horizon's rim;
And from mine eyes the salt tears drip,
And all the orient grows dim.

I lay a shell close to mine ear
To list to what it has to tell;
Thine only is the voice I hear
Sweet as some faint, far Sabbath bell.

Upon an alien shore alone
An exile from my home and thee!
Above the waves' sad monotone
God speaks, 'and there was no more sea.'

# THE GERMAN ARMY.

By RICHARD THIRSK.

THE German army is composed of the combined armies of Prussia, Bavaria, and Saxony. Generally speaking, it might as truthfully be called the Prussian army, since nineteen of the army corps belong to Prussia, whereas Bavaria has but three, and Saxony only one. The total strength of these combined armies during times of peace is put down on paper at something over six hundred thousand officers and men, divided into six hundred and twenty-nine battalions of infantry, four hundred and seventy-four batteries of horse, five hundred and seventy-four batteries of field artillery, forty battalions of fort artillery, thirty-four battalions of engineers, and sixteen machine-gun divisions. Besides these, there are the various necessary auxiliaries for serving such a large army, including the medical staff, the commissariat, the veterinary surgeons, and other non-combative forces. A bill passed recently by the Reichstag empowers the authorities to augment largely the number of men serving in the ranks.

The term of service in foot-regiments is for two years; in the cavalry and horse artillery men must remain a year longer. From active service, soldiers pass into the First Reserve for a period of five years, during which they are frequently called up to their regiments for longer or shorter periods of drill. At the end of this time they pass into what is known as the Landwehr, or Second Reserve, and finally into the Third Reserve, in which they remain until the completion of their thirty-ninth year, when they are freed from military service.

While on active service the infantry soldier receives six shillings a month pay, the cavalryman two shillings more. Lieutenants begin with sixty-four pounds ten shillings a year, rising slowly through various grades to six hundred and ninety-nine pounds a year, which is the sum paid to commanding Generals. To this must be added a small allowance for rent granted to officers who cannot be housed with their regiments.

The Kaiser is the *Oberster Kriegs-Herr*—that is to say, the supreme head of the army, whose approval must be obtained in all that concerns it, who controls all its movements, and who alone has the right and power to send it into action. He has taken upon himself the responsibility of its efficiency and conduct, and it is very possible that should he take it into action he may command it in person.

In his position as chief of the army, the Kaiser is assisted by the Military Cabinet, composed of a number of high military authorities, whom the Kaiser elects as overseers of the various departments of the service, and whose duty it is to report to His Majesty in council all that takes place in the German army and in the armies of foreign nations.

Next to this is the War Office, which is under the charge of the Minister of War. The latter is a soldier of long and varied experience, who also represents the army in the Reichstag, answering the questions asked by deputies concerning it, and negotiating in the Reichstag the yearly grants necessary for the maintenance of the army.

The War Office is divided into a number of sub-offices, each under the control of its own military chief, who is subordinate to the War Minister. From these offices instructions, money, provisions, and all other necessaries are despatched to the units in the barracks or in the field. Thus the whole organisation meets under one roof, which prevents any confusion or the possibility of one part working against another, and constitutes the War Office the great controlling house without which the army would fall to pieces.

But the organising power, the brain, the eyes, the ears, the very soul of the army, is the General Staff. This is a colossal institution, composed of only the picked men of the whole army—those men who have distinguished themselves by their military genius, their knowledge of tactics, their capacity for organising and inventing, or by other distinguished qualities calculated to increase the efficiency and usefulness of the army. They are all of them men with ideas, and of unquestionable ability, devoting themselves entirely to the work of perfect-

[*All Rights Reserved.*]

ing the complicated machine of which they are parts. The General Staff is also the Intelligence Department, and is responsible for all necessary information regarding the strength, movements, guns, arms, and every conceivable particular concerning foreign armies, forts, defences, and the like. According to this information, changes are made in the German army to cope with every emergency, and plans for attack or defence are worked out. Basing its conjectures upon the information in its possession, the General Staff has considered every possible chance of an attack upon Germany from any quarter, and has shown how such attacks are to be repulsed, and how the enemy is to be driven back. Recognising the possibility of an offensive campaign, it has worked out, on paper, campaigns in foreign countries. Locked away in its secret safes the General Staff has its plans, prepared with the greatest mathematical exactness, for the conquest of nearly every nation.

It is when one comes to know something of the General Staff that one realises what the German army really is, and understands something of its magnitude. To discuss the possible success or failure of its plans and theories would be idle. The fact that these have been prepared, and are kept constantly up to date, is a proof of that spirit which courts success, and of the determination of the nation to be ready for each and every emergency. All these plans and theories are tested from time to time in the light of recent events. Struggles between combating Powers are watched by the General Staff with the closest attention, all the incidents marking their progress are impartially criticised, and the lessons learned from these are applied in practice, forming the groundwork for changes and improvements. Another equally important duty is to secure carefully prepared plans of all countries in which Germany may at any time be called upon to carry out military operations.

Probably the most serious work falling to the General Staff is the arranging and preparing of secret plans for the mobilisation of the army and reserves the moment war is declared. As a knowledge of these plans would be of incalculable service to a hostile army, and as there is always the possibility that some part at least of the secret may be betrayed to some interested foreign Power, the plans have to be constantly changed and altered, which means that the work on them is never ceasing. With what smoothness these plans work, collecting the whole fighting army and transporting it to the scene of action, together with all necessary munition and provisions, was amply demonstrated during the Franco-Prussian War of 1870–71. Then, as now, every General had his sealed orders and a time-table, which it was only necessary for him to follow in order to arrive at the scene of action at the time he was expected. So well did these arrangements work out that, though hundreds of units were involved in the various movements, Moltke could calculate with certainty to within a few minutes upon the arrival or departure of any one of these units.

To-day, with increased railway facilities, the system is even more perfect. Yet the railways have added to the complication of the task, making it more difficult to get a comprehensive view of the perplexing network of lines throughout the country; and the work of timing the arrival and departure of trains from all parts of the Empire, and of managing everything so that no block can possibly happen, drives many officers insane. This work in the time-table department is so dreaded that it is difficult to induce officers to take to it, in spite of the increased social advantages which such a position on the General Staff offers them.

This is, as briefly as it may be told, the composition and machinery of the army which was established by Frederick William I., and developed by Frederick the Great into that powerful weapon which has helped to make the nation what it is to-day. Its history has been chequered, and does not always justify the pride with which Germans boast of its deeds prior to its achievements in the war against France, or even since then; yet no one can gainsay that as a fighting-machine it is as nearly perfect as human means and genius can make it. It certainly is a wonderful institution, a marvel of ingenuity and organisation, a monument to the patience and skill of those who are responsible for its existence.

The motto of the German army is 'Ready,' and that is the keynote of everything done in every department of it. A solid business-like spirit pervades everywhere, and nothing that brains, energy, or money can suggest or do is spared, nor anything left undone which may help to keep it true to its motto and be always 'ready.'

Unfortunately it is an axiom that there seldom is a good that has not its attendant evil; and German militarism is no exception, as the Germans themselves are the first to admit. One of these evils is its increasing cost to the nation; but this must be looked upon as a necessary evil, since the army is the symbol of settled security to which the nation owes its existence, and endows it with that confidence so essential to industrial and commercial success.

Heavy as it is, the cost of maintaining the army is not the heaviest part of the military burden. It is as nothing compared to the enormous sacrifices which universal military service demands; and this hits hardest the middle or commercial classes, whose sons must give up to the army some of the best years of their life, which, needless to say, generally proves a severe handicap to them in the prosecution of their studies or the following of their commercial pursuits. The frequent claims which the army makes upon their time at varied periods causes a feeling of unrest and dissatisfaction. On this very practical point all the German's theoretical pride in the army vanishes. He complains that universal military service is a vicious, unrelenting institution, which makes no

allowances or exceptions, which never takes into consideration whether or not it is ruining a young man's chances in life. It is so far-reaching that it hinders and upsets the ordinary course of business. Merchants and manufacturers look upon it as a bugbear. Almost the first question they ask an applicant for a vacancy is if he has finished his military service; and if he has not, they prefer not to employ him. They complain that they no sooner have taught a young man their business methods, and find him of use to them, than he must leave them for the army, and they cannot afford to let their business stand still until his return, so they have to fill his place as best they can; and when the young man leaves the service he is without a situation. No amount of argument can prove that it is a good thing to disturb the routine of a business, either for employer or employed. Therefore, however beneficial compulsory service may be for the nation, it damages the individual. And the hardships do not cease on expiry of the first term of military service, for when the reservist goes to exercise for eight weeks with his regiment either he and his family must suffer, or his master.

When a man settles down in business for himself his case is even worse, if possible, for it has happened that the army has ruined many who had begun in a small way. An instance of this was reported in the newspapers quite recently, and it may be taken as typical of many, though fortunately they are not all attended with the tragic circumstances which brought this case before the public. A man invested all his capital in a business, to which he applied himself with diligence, and began to do very well in it, until he was called out to serve some weeks with the Reserve. Unfortunately for him, he had not the means to afford a substitute to keep his business going during his absence. On his return he shot himself, and the examination proved that his reason for doing so was because his business, which depended entirely upon his personal effort, was hopelessly ruined through his having to close it for so long a time.

Another objection to universal military service is that it is dangerous to health—not the actual service, but the dread of it. Nearly all enterprising young men desire to escape military service for no other reason than that they wish to enter at once upon their life-work. In the hope of unfitting themselves for passing the doctor's examination they tamper with their health, often causing such damage as to ruin it permanently.

It is because of universal military service that Germany has never been a successful colonising Power. The adventurous young men, those who might be getting about the world, and probably winning territory for the Fatherland, are obliged to stay at home for the army. If they do go away, they must return within a certain time and at their own expense. This is seldom convenient or practical, and compels them to choose between two alternatives: either they must give up what prospects they have before them and become soldiers, or they must throw off their allegiance to Germany entirely, becoming citizens of the country in which they have settled.

The present condition of Germany's colony in South-West Africa is a startling revelation of the failure of conscripts, as compared with volunteers, to keep law and order in a colony. In the disastrous campaign against the Hereros, Germany refused to employ men who lived in the country, who had their interests there, and who knew the ground; preferring conscripts from home, who went out feeling they were going to martyrdom. One way or another, they managed to drag out the punitive expedition for an unconscionably long period, and few of them returned with much glory to themselves.

Realising some of the drawbacks of universal military service, the Government has tried to minimise its hardships by introducing what is known as the *Einjährig Frei-willigedienst*, or one-year service. The privilege of serving for only one year instead of two is granted to all who pass the middle classes of a high school. For this privilege they have to pay all the costs out of their own pocket. These include kit, uniforms, board and lodging, a man-servant, and the numerous expenses incidental to a soldier's life, which in the crack regiments may run up to a thousand pounds for the year, and which in the so-called cheap provincial regiments average two hundred and fifty pounds. From these one-year service men are recruited the officers of the Reserve, and as this title carries with it much influence, most young men are ambitious to obtain it. But as a very large percentage of those who possess the necessary certificate have not sufficient money to pay their expenses, they are obliged to launch into debt, and to place themselves and their parents under obligations, which burden hampers them in their future career. Hence many young men who have the one-year service qualification and not the necessary funds are obliged to serve as ordinary soldiers; for although the Government has a fund for assisting such, the conditions under which it is granted are not particularly enticing.

Another objection to this favour shown to educated men is that one-year service men are not popular with the ranks, being considered the legitimate sport of all who can take advantage of them. Nor are they looked upon with much favour by drill-instructors, except in those instances where there is a prospect of future gain. The drill-instructor is generally more noted for his bullying and abusive proclivities than for his intelligence, and only too often uses the power confided in him to make the soldier's life unbearable. His idea of a soldier is that he is something like a wild animal, which must be trained to do a certain number of things in a certain way within a certain time. The authorities allow him considerable latitude as long as he produces the results required of him, though he has frequently to be

court-martialled for the brutal and disgusting methods he adopts.

For a man of education and self-respect to submit himself to the rule of such a drill-instructor is to feel degraded and insulted. Rather than undergo this treatment many young men leave the country, never again to return to it; for the pains and penalties awaiting them in the event of their return are more terrible than the methods of the army they flee from. The mere fact of their running away proves them, in many cases, to be young men of spirit and pluck, such men as the country cannot easily afford to lose, who, were they permitted to remain at home, would turn out useful members of society. As it is, they look back upon the Fatherland with no particular pride, and their parents often curse the evil which robbed them of their sons; and when a son longs to return through illness in the family, or when other occasion requires his presence, he is kept away by fear of the authorities, who are waiting for him the minute he puts his foot upon German soil.

For this reason, it is to be feared that the army is killing patriotism in Germany, even in the army itself. The service is dreaded more and more as industrialism advances, and the only good thing that men have to say for it is that they have done with it. So strong is the feeling against it in the middle classes and the lower classes that were it not for universal military service very few men would be soldiers in Germany. Doubtless when the necessity arose volunteers in plenty would flock to the standard, but during peace-times the army is far from popular, and individual pride in it is more abstract than real or practical.

It may be possible that the conditions of life for which the army is responsible account for the sad fact that so many Germans when they go abroad deny their own country. It may also be for the same reason that they permit themselves so readily to become absorbed by other nations, making good citizens of other lands, to the abiding loss of their Fatherland. The greater freedom they enjoy abroad appeals to their imagination; they feel themselves more the masters of their fate, and they take advantage of every opportunity offered them by throwing off all their allegiance to the home-country and naturalising in the new.

Many complain that the army is an institution which the introduction of commercialism has antiquated, an institution that has not kept pace with the forward march of events. Much dissatisfaction is found in the army itself. The men complain that they have far too much drill and too many parades; that they have to go through exercises from sunrise till sundown, until they are completely worn-out. There is also much grumbling about the food. It is of a kind to which many of them have not been accustomed at home, and which, they say, is no more than sufficient to keep up their strength. The coarse black bread they can hardly eat, and the pay they receive is not sufficient to keep them in tobacco. Consequently they are dependent upon their parents and friends to send them hampers of food and money. Their great longing is for the time when they will be able to return to civilian life, and they tick off on their calendars the days as they pass, anxiously counting the time that remains between them and liberty.

Even the officers have their grievances. They feel in all things the power of the 'one hand,' as they express it; that the army is too much the Kaiser, being held in subjection to his absolute will. Every now and then he introduces changes in the officers' equipment or the style of their uniforms by way of experiment, the cost of which comes out of the pockets of the officers, who grumble about the expense. Officers are in no sense of the word free agents. Even their opinions are prescribed for them; and if they hold views on politics, government, and progress which are known to be at variance with those held in high quarters, they are compelled to run the gauntlet, and possibly to leave the army. They are forbidden to smoke in the three fashionable streets of Berlin; and if, when they are driving, they meet a Royal equipage with the coachman holding his whip aloft, thereby denoting that some Royal personage is behind him, the officers must stop their carriage, alight, and stand at the salute until the Royal equipage has passed by. No officer can marry without the consent of his superiors, who inquire if his intended wife is a fit associate; and should the result of the inquiry prove favourable, a fixed sum of money must be invested in the regimental funds, upon the interest of which the officer and his wife may be able to keep house and entertain in a manner befitting their position in the army.

Doubtless the sorest point of all among the officers is the slowness of promotion. Because of this, many of them, who are poor to begin with, and who have not the good fortune to marry money, have to eke out their salaries by remittances from home until they are over forty years of age. Usually an officer without influence serves something like twenty years before he obtains a captaincy, and before he can attain to any of the more lucrative positions he has reached the age-limit, and is retired on a pension wholly insufficient to keep him in comfort. It is stoutly maintained, and with some show of truth, that all the good posts in the army go to favourites belonging to the nobility, who practically hold a monopoly of such positions.

Much has been said in praise of the German army as being a good training-ground for the rougher element of the population, instilling into it some notion of discipline and orderliness. This the army may do, but it is questionable if the good wrought in this way is in due proportion to the evil wrought in other ways—as, for instance, when a young man who has been carefully brought up at home enters the army and comes into contact with the evil influences of the questionable characters around him. Whether or not he submits to these is merely a question of temperament and character. The chances are that in the process of having his eyes

opened he gets somewhat contaminated, and returns to his home a different man morally from what he was when he left it. In any case, it is not a particularly pleasant prospect for respectable parents to have the knowledge that their sons are likely to be boarded together with young men whose respectability is so questionable that the army contemplates reforming them.

Considering the large number of men serving with the colours there is comparatively little crime in the German army. The latest statistical report for the year 1907 gives the number of military and civil offences dealt with by the military authorities at ten thousand two hundred and fifty-three, and this proves a considerable decrease on the previous year. There are, however, a number of irregularities for which the army is either directly or indirectly responsible, but which are not included among the offences, and are therefore not published in statistics. The army is more concerned about drill than about morals. Its one and only aim is to lick the soldier into proper shape, so that he may fit exactly into his place in the machine. Its method of accomplishing this end is systematically to crush all individuality out of him, and to make him one of the crowd, moving in blind obedience to the word of command. Hence officers will tell you that in a whole regiment they cannot find more than twenty or thirty men in whom they can place any confidence; and it is on those few that they must rely for leading all the others, whom their officers characterise as being hopelessly stupid and entirely innocent of any common-sense.

This is not a particularly favourable comment upon what is often lauded as being the great social and economic advantage of the army—the advancement of the education of young men whose schooling has been neglected. True, there are schools in which those soldiers who come to the army ignorant of orthography may learn to write their names legibly, but it is questionable if beyond this they learn anything of real practical value to them. Young men who have been brought up on farms naturally have their wits sharpened through contact with the new world into which the army introduces them and the new companions whom they meet. Yet experience goes to prove that this kind of education is not always good for them. It makes them dissatisfied with the country life they have hitherto led, and causes them to look upon it as being narrow and cramped, and in order to escape it they remain in the overpopulated towns, adding their quota to the unskilled labour markets. Thus the education received in the army has been largely responsible for the undoing of Germany as an agricultural nation, a result which the military authorities have tried in vain to avoid.

Realising the seriousness of this, the Kaiser has now thrown all his influence into the movement which is endeavouring to stem the tide flowing townward. What he most wants is the healthy type of soldier who hitherto came from the agricultural districts, but who is fast disappearing. The various schemes favoured for the accomplishment of this end are likely to cause some interesting developments in German legislation, especially when the Land Reform question comes to be finally dealt with.

So long as the army remains one of the greatest factors in the country for the spread of political propaganda, a small holdings scheme, or any other plan, can only meet with partial success. Political influence is working more mischief than the authorities can counteract, much as they try to check it. What gives them the gravest concern is that this political influence is mostly in favour of the spread of the Social Democratic agitation. The members of this party serving with the colours soon succeed in interesting their dissatisfied comrades in the movement, and introduce them to their societies. Those men who later return to the country districts take with them their new political ideas, influencing people in remote parts who have never before heard anything about the party, and this had a tangible effect at the polls at the last elections. It is a very important part of the Social Democratic organisation and plan of campaign, and the party, in spite of its recent defeat, succeeded in adding over five hundred thousand votes in its favour in the course of a few years, and that in face of the strenuous efforts of the Government to effect a reduction.

The seriousness of this influence is proved by the fact that the authorities do not trust men to serve in the regiments stationed in their native districts. For instance, conscripts from German Poland are made to serve in West Prussian regiments or are brought to Berlin, while those from Elsass and Lothringen are sent to the Polish province and to East Prussia. In this way towns are garrisoned by men who are entire strangers to the districts, so that in the event of a rising among the inhabitants there is little chance of any sympathy between the latter and the soldiers whose duty it would be to deal with them. In any case, the authorities admit that dividing the troops in this way gives them a feeling of greater security.

These are a few of the problems with which this great organisation has to contend, and which are apparent to the casual observer. Yet it must not be inferred from them that there is any corruption in the army itself which would in any way affect its efficiency in the field. To be led into such a mistake would be fatal. It is so entirely under the power of the authorities that such a condition is altogether out of the question; nor, indeed, is there on the part of those serving in it any desire to see it otherwise than the powerful weapon of war that it is, probably the most powerful that has ever been invented.

# LAURISTONS.

## CHAPTER XVIII.—HOW SIR GEORGE PASSED AND LEFT HIS BURDEN BEHIND HIM.

JOHN SAX'S usually quiet face was gray and drawn as he lifted it from bending over his stricken chief when Captain Charles came back into the room, and he was evidently labouring under very strong emotion. 'We have been speaking,' he said abruptly. 'Sir George has something to say to you.'

'I would give years of my life to ease you, father. Only tell me what I can do,' said Captain Charles with deepest feeling as he bent over the bed.

'Your father asks from you,' said John Sax, 'a solemn promise that you will carry on the business as it is now being carried on.' And the eyes of the dying man glued themselves to his son's in heart-breaking entreaty.

'Oh, surely! I have never had any other thought in my mind, sir. Do not let that trouble you for one moment.'

'He knows what a wrench it was for me to quit the army,' thought Charles, 'and thinks I may dispose of the bank and return to it. And the bank has been his life's work.'

'You solemnly pledge your word of honour to carry on the business as it is now being carried on? It will be a satisfaction to him, Mr Charles, to hear you say it.' And the dumb anxiety of the tortured soul dragged at Charles's heart.

'I solemnly pledge my word of honour to carry on the business as it is now being carried on,' said Charles. 'And I promise to give my life to it as you have done, sir. Nothing shall be wanting on my part.' He never forgot the infinite depth, the uplook from the whelming waters of another world, the pathos, the tragedy of the sad eyes that looked up into his as he said it.

'Do you desire more, sir, just now?' asked John Sax.

But the weary eyes closed, and remained closed, as though they had done with earth's sorrows and anxieties, and craved only rest. And John Sax drew quietly back from the bed with a deep breath that was like a sigh.

Captain Charles went softly out and found Charlotte, her eyes red with weeping, her face all puffed with grief. But he could give her little comfort, and he was soon back in his father's room.

The afternoon wore itself out. The windows of the palace across the Queen's Gardens flamed in the setting sun; the shadows gathered among the trees and shrubberies and stole out over the trim lawns and flower-beds. The ponds alone gleamed pale and ghostly, like wakeful, watching eyes. Then the light faded in the sky, and the shadows claimed the ponds also, and Charles Lauriston and John Sax sat silently waiting.

At times one or other of them would hold his breath and listen intently, in fear that the slow breathing on the bed had ceased and the dread moment come; but, with what seemed most dreadful breaks and pauses at times, it would go on again, and theirs would follow it suspensively. Charles brought in a shaded lamp from the library, and the moment the light fell on John Sax's face he sent him away downstairs to get something to eat and drink, for he looked ghastly.

'You must keep up, John Sax, for all our sakes,' said Charles in a whisper; and Simmonds saw to it that such sustenance as outward ministration could afford was not wanting.

Simmonds asked after his master, in whispers also, as he waited on him with his own hands. For over forty years Simmonds had been to Sir George in the house what John Sax had been to him in the bank, and the end that seemed near was to him as the end of all things.

'Make Mr Charles come down and take something, Mr Sax. Trouble's easier borne on a full stomach than an empty one,' a precept which Simmonds himself had visibly practised all his life.

John Sax nodded and went back to the silent vigil upstairs, and presently Charles came down to satisfy Simmonds's requirements and his own.

'No hope, Mr Charles?' asked the old man.

'I fear not, Simmonds. Berkeley fears the worst.'

'It's uncommon sudden, Mr Charles. I've heard of folks having two or three strokes, by way of warning, as you might say. It's hard we should have only one and done with it.'

'I'm afraid he has worked beyond his strength, Simmonds. He has always looked well, but he would insist on keeping a very great deal in his own hands, you know. I don't suppose any one else could have done it as well, but I'm sadly afraid he's paying for it now.'

'Like enough, Mr Charles. Many's the time, when you've been away, that him and Mr Sax has been shut up in his room together till long after midnight. And that's wearing work, on top of a hard day's work too. And how is Mrs Lauriston, sir, and Master Charles and Miss Mavie?'

'The children are first-rate, Simmonds, and Mrs Lauriston is certainly stronger, though she's not quite her old self yet.'

'We miss the sight of her here, Mr Charles. I always used to say a glimpse of her sweet face made one feel as if the sun were shining right inside the house.'

'You're quite right, Simmonds, and your thought of her does both you and her honour. Now I must get back. I have been expecting Dr Berkeley every minute. Have something ready for him if he cares to take it. He is overworked too just now.'

He had barely got back to his father's room

when he heard the doctor's carriage drive up, and Berkeley came straight upstairs.

'No change?' he whispered.

Charles shook his head. 'Several times we have feared he was going; but'——

The doctor nodded, and, after critical observation of his patient for several minutes, beckoned Charles to follow him out of the room.

'Simmonds was offering me refreshment,' he said as they reached the dining-room, 'and I will accept it gladly. I've been on the go since I left you. I shall stop here now. It is only a question of time, and not very long, I fear. He is sinking slowly. I should say he has no pain, and his mind is more at rest, which makes for a peaceful ending.'

'He will just fall asleep?'

'One can never say,' with a shake of the head. Then nodding thoughtfully, 'Death is still the great mystery. Death the Consoler—the Healer—to those who are left, a grim black shadow; but to those who go possibly a sweet-faced angel with smiling face and welcoming hands. At least that is how I like to think of it myself.'

'It is a happier thought than the other. But it comes in terrifying forms at times—to the onlooker, at all events.'

'Exactly! We see the outside only, and the flesh may be wrung though the spirit is at peace. Do you fear it yourself? As a soldier—no?'

'For myself, no. For those I might be leaving behind'——

'Ay, that's where the wrench comes. And it is natural too, as natural as it is for every man to think himself essential, which no man really is.'

'All the same, his going may leave a gap and a wound.'

The hours dragged on slowly and wearily to the sound of the long, slow breathing on the bed, and the startling abruptness of the watchman's cry as he crawled on his round outside.

'Two o'clock and a fine, clear night!' had given place to 'Three o'clock and a fine, clear morning!' The shadows in the Queen's Gardens, over the way, were gathering up their skirts for flight; the ponds were like watchful eyes struggling with the mists of sleep; the east was just pearling to the dawn, softening and opening as though for the passage of troubled souls, when the three men, sitting, heavy with watching, behind the screen where the shaded light was, were startled suddenly to their feet by a hoarse, strained whisper, a dreadful whisper under the circumstances, 'Charles! Charles!' and they hastened to the bed.

Sir George was sitting up, bending eagerly forward, his gray face weirdly lit by the last flicker of the dying light within.

'Your promise!' he jerked, sawing imperatively with his feeble right arm. 'I charge you!' And it was dreadful to see the battle between the spirit and the flesh. 'You will suc'—— He swayed heavily forward, choking for breath. Then, with a valiant, an agonising effort, 'You—will—succeed'—— For an instant the light glowed in the deep-worn eyes, and then he sank forward in a heap.

They laid him back on his pillows, the laboured breath was indrawn twice and twice expired in a long-drawn sigh, one more breath he drew, and sighed no more.

For good or ill, Sir George Lauriston was dead.

And old John Sax's face was as colourless as the face of his dead chief.

*(To be continued.)*

# THE BRIDGES OF THE CITY OF LONDON.

By A. J. Glasspool.

THE recent widening of Blackfriars Bridge and the coming of the County Council trams over the territory of the City of London has naturally drawn attention to the unique means by which the City bridges are constructed and maintained. It is well for the ratepayers of London that the Bridge House Trust exists, for out of its funds such magnificent structures as the Tower Bridge and also the other bridges within the City's jurisdiction have been erected, repaired, and improved.

Our forefathers acknowledged the value of bridges. The names of those who were connected with the Bridge House Trust are lost in oblivion. The fund was certainly in existence in 1122, for in that year, the City records inform us, the monks of Bermondsey and the Church of St George, Southwark, received five shillings as an annual rent out of the funds of the Bridge lands. The Trust was probably commenced by charitable contributions; grants of toll for this purpose were allowed by the Saxon and early Norman kings. It was William Rufus who imposed a tax to furnish labourers for its rebuilding. Henry the Second assisted by means of a tax on wool; this gave rise to the belief that London Bridge was founded on wool-sacks. King John gave the 'God's Pence' taken from foreign merchants. Funds were raised by the rents of the houses built on the bridge.

The money thus derived attracted the attention of monarchs. Henry the Third seized on the funds, first granting them to the Hospital of St Katherine, and afterwards to his consort, Queen Eleanor; London Bridge fell into decay, and consequently the brothers of the Chapel of St Thomas, on the bridge, had to seek charitable aid to maintain the fabric.

In 1412, in the mayoralty of Richard Whittington, the annual value of the Bridge House Estates is put down at £148, 15s. 3d.; in 1591 the amount

left over after paying expenses was £109, 17s. 6¾d.; in 1611 the houses on the bridge produced the sum of £472, 11s. 8d., and the revenues from the Bridge House Estates had increased to £1546, 16s. At the present day the annual income is about £150,000. The accounts preserved at the Guildhall are written in Latin from the year 1381 until the year 1480; some are marvellous specimens of calligraphy. Prepared on loose sheets, they were afterwards bound in volumes in elaborate binding.

It may be interesting to know that the Bridge House sign, used to the present day on all documents associated with the Trust, is supposed to have originally been a merchant's mark. That means of communication to either side of the river was considered an important part of the Corporation work may be gathered from the fact that on the obverse of the ancient seal of the Corporation was seen London Bridge, with a boat riding on the water below.

That the Bridge House buildings were used for important public purposes may be gathered from interesting facts recorded in the City's letter-books. On the 30th December 1594, we read of a 'Letter from the Lord Mayor to the Lords of the Council, complaining that he had received a message from Sir Francis Drake and Sir John Hawkins, requiring for the use of the fleet the garners and ovens within the Bridge House, which had been erected by the City for the storing of corn in time of dearth and for baking bread for the poor; and requesting them to direct the knights to use H.M. garners at Tower Hill, Westminster, or Westminster Palace for the purpose.' Again we read, on the 14th January 1624, of a 'Letter from the Lords of the Council to the Lord Mayor and Aldermen, requesting them to give directions for the delivery to Sir Allen Apsley, one of the Surveyors-General for victualling the Navy, of two thousand quarters of wheat from the storehouses at the Bridge House, Bridewell, and elsewhere.'

A faint idea of the enormous amounts paid out of the Bridge House Estates funds on account of City bridges may be gathered from a few simple statements. With regard to London Bridge: removing the tolls in 1767 cost £30,000; rebuilding in 1833, £483,732; approaches (north and south, 1824 and 1846), £1,021,421; widening (1904), £100,000. Blackfriars Bridge: building the first bridge (1760 and 1812), £230,000; rebuilding (1863), £401,131, 1s. 4d.; widening (1909), £150,000. The purchase of Southwark Bridge cost £218,868, 18s. 8d., and the building of Tower Bridge £1,060,000.

The evolution of a bridge is a subject fraught with the deepest interest. It is a long journey from the simple stepping-stones, or the trunks of trees laid across a stream, to the Tubular Bridge of Robert Stephenson built across the Menai Strait. Some of the bridges of ancient days were remarkable for their skilful construction. In China we find stone bridges of which no records will tell us the day of their building. The bridge of boats formed by Xerxes across the Hellespont in 480 B.C., and Trajan's stone bridge, four thousand seven hundred and seventy feet long, over the Danube, A.D. 105, were both masterpieces of good work.

The occupation of England by the Romans was of a purely military character. To keep the inhabitants in subjection good roads were highly essential. There could be no better starting-point than London; and it seems natural that we should find, in that portion of the itinerary of Antoninus Pius relating to Britain, that nearly one-half of the routes described started or terminated in London. Dr Reginald R. Sharpe, in his *London and the Kingdom*, remarks: 'The same reasons that led the Romans to establish good roads throughout the country led them also to erect a bridge across the river from London to Southwark, and in later years to enclose the City with a wall. To the building of London Bridge, which probably took place in the early years of the Roman occupation, London owed much of its youthful prosperity. Whenever any accident happened to the bridge, the damage was promptly repaired.'

Whatever was the nature of the structure of the first London Bridge, it does not seem to have been very substantial. We know that when the Danish fleet chose Canute's son to succeed his father in 1014, the English Witan declared for Ethelred; and he returned to England, accompanied by Olaf, the king of Norway. The Danes were assembled on London Bridge in great numbers to prevent Ethelred and Olaf from entering into London. With their united fleets, they determined to make the effort. They covered their boats with wooden roofs, and rowing bravely up to London Bridge, placed cables round the piers; then rowing down-stream, they caused the piles to become loosened, the bridge gave way, and the Danish fighting-men were precipitated into the stream. The memory of King Olaf's assistance is preserved in the names of four London churches: St Olaf, Jewry; St Olaf, Hart Street; St Olaf, Silver Street; and St Olaf, Tooley Street. A Scandinavian poem also celebrates this event:

> London Bridge is broken down,
> Gold is won and bright renown;
> Shields resounding,
> War-horns sounding,
> Hildur shouting in the din!
> Arrows singing,
> Mail-coats ringing,
> Odin makes our Olaf win!

The bridge was rebuilt, only to be swept away entirely by a great storm in 1091, when, we are told, six hundred houses in the neighbourhood were destroyed. Stow mentions that in 1114 the stream between the Thames and London Bridge was dried up: 'A great number of men, women, and children did walk over both on horse and foot.' The bridge having been destroyed again by fire in 1136, a new bridge was constructed in 1176 by Peter of Colechurch. Peter was a priest of St Mary Colechurch,

situated at the corner of Conyhoop Lane, Poultry. His church was built upon a vault above-ground, 'so that men were forced to ascend into it by certain steps.' It was here that Thomas à Becket was baptised, his father's place of business being situated not far away—on the site of the present Mercers' Hall.

London Bridge was then in its glory; it was one of the sights of the Metropolis, its Non-such House and the Chapel of St Thomas attracting much attention. In 1756 all the houses were pulled down, and in 1822 John Rennie's designs for a new bridge were approved; the work, however, was carried out by his two sons, John and George.

It seems strange that any opposition should have been made to the proposition to construct another bridge across the Thames. It is, however, a fact that several ineffectual attempts were made in this direction in Parliament during the reigns of Elizabeth, James the First, Charles the First, and Charles the Second.

The question was raised in the House of Commons in the year 1731 regarding the building of a bridge from Palace Yard to the Surrey side of the Thames, the money to be obtained by a lottery. The first stone was not laid till 1739, and in 1750 London Bridge had its earliest rival.

As London increased in population the enormous traffic caused much congestion on London Bridge, and many demands were made for the widening of the bridge. There was, however, desperate opposition to any interference with Rennie's beautiful structure; numerous acrimonious debates took place in the Council Chamber at Guildhall on this subject, one well-known councillor concluding his speech in defence of the bridge in Macaulay's well-known words:

> Now, who will stand on either hand,
> And keep the bridge with me?

Those who wanted a new bridge got their way when the Tower Bridge was opened, and in due time the advocates of the widening of London Bridge were also satisfied.

London Bridge has been associated with many happy and as many unhappy events. The grim heads of traitors struck terror into the hearts of evil-doers; from its roadway Queen Eleanor was pelted with mud and stones. Perhaps the bridge never looked so beautiful as it did when our Queen, as Princess Alexandra, made her entry into London. Portraits of Danish kings adorned the bridge, and tripods held sweet incense to perfume the air and to kill the evil scent of the river; a gorgeous triumphal arch on the City side was magnificent by day and by night.

In a few years no doubt another bridge will cope with the increasing demands of London's traffic; but no bridge will ever be a genuine rival to London Bridge in historical interest and in the simple grandeur of its design.

---

# WHEN WINTER CAME TO GREEN'S FERRY.

### CHAPTER II.

IF there is one word of appreciation a man loves more than another it is the term 'prince.' Van Peldt dwelt upon it, for it had an added charm when spoken by Maddie Buchanan.

The cold wind moaned down Lake Lomond, and the young man drew his coat around him as he left his home. Dark as God's wrath and cold as the hand of death, the night whipped his cheek with tiny particles of flying ice. Indian summer had gone, and winter was upon the land. He turned his back to Cromarty Head and looked to the north. A faint light shone, glimmering and fading; now for a moment it was lost to view, again it fluttered back to life. It could be seen only from Cromarty Head, and Percy Van Peldt alone knew whose light it was. It was the camp-fire of Douglas Craig Douglas, perishing on his rock.

Van Peldt felt like a despot king, with the life and death of a man in the hollow of his hand. Why should he interfere with Fate playing the game for him? His rival marooned, Maddie half-won; a few hours more and the game would be ended. 'All is fair in love and war' he told himself again. But his was not the part of a prince; he winced and tried to think of something else. The tiny speck of camp-fire, like a red star in the murky night, had an accusing glow. He drowned the voice of conscience with an oath.

'Curse you! Starve, freeze, drown! I hold the winning hand. Life is a game, Douglas Craig Douglas, and I win. Go down to your defeat like a man—down—down with Runkle. The gods are with me, and the world is mine!'

And how the three Fates must have smiled!

He turned away from the light and strode off to Lodgewinna.

The Virginia creepers tapped like human fingers on the window-pane, and a long stream of light poured across the frozen beds of phlox and verbenas. Silently he stepped within the porch-door and contemplated the scene before him. It was such a picture as artists paint. Maddie sat at the old grand piano, on one end of which was his photograph, on the other end the portrait of Douglas. A great sheaf of chrysanthemums he had ordered from Ottawa shadowed the centre-table; in equal prominence was a bunch of water-lilies the Guardsman had gathered for her on the Quebec side. Slowly her fingers touched the ivory, and then her voice arose in song, sweeter and sadder than he had ever heard it before, the plaintive notes sounding almost like a requiem:

'Could you but come back to me, Douglas, Douglas,
In the old likeness that I knew,
I would be faithful and loving, Douglas—
Douglas, Douglas, tender and true!

'Never a scornful word should grieve you,
I'd smile on you sweet as the angels do;
Sweet as your smile on me shone ever—
Douglas, Douglas, tender and true!

'Oh, to call back the days that are not!
My eyes are blinded, my words are few,
As I lay my heart on your dead heart, Douglas—
Douglas, Douglas, tender and true!

'I never was worthy of you, Douglas,
Never half-worthy the likes of you.
Do you know the truth up there in heaven?
I—love—you, Douglas, tender and true!'

The girl's voice broke with sobs as she finished, and rushing to the photo of Douglas, she threw her arms about it and burst into a freshet of tears.

Nothing else could have told Percy Van Peldt the truth as he heard it that night; he was learning more of women at Green's Ferry than Newport or Saratoga could have taught him. He knew that in half-an-hour she would have consented to become his wife, but he also knew that he never could have won her while she thought her hero lived. She had told him, and would tell him again perhaps, that she did not love him. With Douglas Craig Douglas a dead memory there was wealth to gain, Lodgewinna to save, an old man's life-desire to be indulged, and all her childish ambitions realised. That afternoon she had weighed his wealth and the luxurious life he had to offer against the personality of Douglas, and the Guardsman had outweighed them all.

And, strangest of all—he had wondered at himself—he did not blame her; it seemed such a natural thing to do. At twenty he would have married her had he known she secretly hated him, but at twenty-five he craved the love she had given to another. The world in an instant had slipped from his grasp. He left Lodgewinna as silently as he had come, and walked through the stormy night back to Cromarty Head. Defeat had made him a more manly man. Blinking and trembling, the little camp-fire shone bravely, the only star in an inky darkness. He was glad he had known and loved the woman; a strange sorrow and joy had formed a truce in his heart. He was again a king in word and deed, but not a despot, and the lives and happiness of three people lay in the hollow of his hand. He looked at the light in friendliness now, murmuring lines he had once heard in a play, 'I am going to do a far, far better thing than I have ever done.' His face was drawn and set as he entered the cottage.

'Meakin!'

'Yes, sir.'

'Get the men to take out the *Genevieve* and go to Desolation Island at once. Tell them to bring back the man they find there. Let them tell him we saw his camp-fire. Get a clear track and a special to take my car to Ottawa. Wire the Russel House to reserve apartments.'

'Yes, sir.'

'Send this note to Lodgewinna at once.' He scribbled across his card:

'Called suddenly to Ottawa. Douglas Craig Douglas has been found alive and well on Desolation Island. Sorry I cannot come over to-night. See you when I come back. *Au revoir.* PERCY.'

It was a light-hearted note written in his own heart's blood. He stood for a moment blinking stupidly at the light. 'The game has turned. Douglas, you win,' he said.

Douglas Craig Douglas had tried in vain to live within his income, but his tastes were extravagant. He loved fine books, fine horses, fine dogs, and fine wines, yet his salary was scarcely twice that of Van Peldt's man-servant. As captain of the Strathmore Guard, his remuneration came mostly in honours and social recognition at Ottawa. This was the reason why his wooing of Maddie Buchanan had always stopped short of the words, 'Be my wife!'

The consciousness of his limitations came to him more bitterly with Van Peldt's rivalry, and he grasped at the possibilities of gambling to help him from the horns of dilemma. For the past three weeks he had been dabbling in stocks; but it had been a see-saw of fortune, and the stakes were small. Copper stocks on margin seemed to promise the best action, and he wired his broker to buy Colorado and Montana Company shares on one dollar margins.

When the point was made he ordered him to close out and buy in again with the entire amount, and continue on this plan, often referred to as pyramiding. C. and M. seldom moved more than one or two points a day. He would probably quadruple his thousand—all he had—or be penniless. So he paddled off that eventful afternoon with no occasion for apprehension.

There were balloon ascensions in Wall Street when Percy Van Peldt's brokers began a plan of action to break Runkle, whose hobby was selling C. and M. on margins.

The quarrel between the men had been a personal one. Runkle had made an ugly remark about Van Peldt, and the Press had quoted his words.

The stock, operated by unknown forces, began to rise slowly and steadily. 'Bull abature' meant more to Douglas Craig Douglas than a few thousand dollars; but he was shivering on Desolation Island, wondering if the two points had been reached, wondering if his love and fortune and life would all end in another miserable night on a barren rock. When the squall swamped his frail canoe he had swum through the icy waters to the island. He drew fire from the heavens with his sun-glass, and huddled beside the blazing driftwood all night long. Hunger crucified him, and hope died when

he saw for the second time the sun set in the blue-black timber, while Colorado and Montana closed ten dollars higher and left him nearly a millionaire.

Next morning, after Van Peldt's yacht had rescued him, the telegram handed to him in his room at Green's Ferry said simply, 'C. and M. closed at $149. $750,000 to your credit. Advise us.'

He laughed. There must be some mistake. Then his eye fell on the headlines of an Ottawa paper: 'Bulls Copper Market. Young Van Peldt causes flurry in Wall Street. Colorado and Montana goes skyward.'

He turned to the telegram again. 'C. and M. closed at 49.' He knew he had bought at 39. He figured mentally. He had doubled his total capital each turn—one thousand, two thousand, four, eight, sixteen; at the ninth turn he was lost in a maze of figures. An ill wind had simply blown him a fortune.

'Cease operating' was the message he sent his broker. Then he put on his hat and walked over the snow to Lodgewinna.

They talked of different things in the low, sunlit windows of Lodgewinna—the storm and the rescue, and of trivial incidents. Outside, the snow glistened over the phlox and verbena beds it had buried. The hedges and firs were bowed with their wrappings of ermine. Sleigh-bells tinkled along the roadway. Only yesterday it was golden Indian summer, and this morning by a miracle of a Canadian night all was turned to winter.

Douglas hugged the secret of his success to his heart; one more triumph, one more, and then the world was at his feet. There was no sign of emotion in the eyes of Maddie Buchanan, no sign of the love and anguish that had wrung her heart the night before. She talked of the frozen verbenas nonchalantly, and of Van Peldt. They are a self-contained people the Scotch Canadians.

'And Percy left last night for Ottawa, with only a note to say "Good-bye." It must have been important business that made him break an appointment.'

'It was,' said Douglas, 'a big deal on Wall Street. See what the *Free Press* calls him, "The Young Copper-King." They say he has enormous interests in all the leading copper-mines of the west.'

Maddie sighed. The sun had gone behind a cloud, and the snow-caps began to look cheerless.

'Douglas, I wish you were a king of some kind.' Then she laughed at the idea. 'What would you do?' she asked.

He turned to her with a face full of earnestness. Three-quarters of a million dollars is a lot of money anywhere, but particularly in Canada. He felt like a king. His thoughts went back to a poem he had written while in Edinburgh. He seemed to be musing:

'If I were king I'd woo you as a peasant,
Beneath your windows serenades I'd sing;
Holding your hand, through woods and valleys pleasant,
I'd wander happily—if I were king.
There'd be no tinselled courts of pride and glory,
No fawning courtiers nor viziers grand;
I'd pay you homage with the old, old story,
And crave the merest favour from your hand.

'If I were king I'd lead no hosts to battle,
Unto my slaves the joys of war I'd fling.
My highest, holiest, noblest ambition
To kiss your eyes, your hair, your lips—if I were king.
I'd be a slave the while I was a peasant,
A captive bound by love's own silken chain;
I'd pay the hostage of a life's devotion,
That you as queen within my heart might reign.

'If I were king there'd be no blare of trumpets,
I'd win you with a glory all my own;
I'd wear no purple to your pride appealing;
I'd woo you with a heart and not a throne.'

The girl's eyes fell, and Douglas held out his hands to her.

'If I were king my love could be no dearer;
I'd throw aside my crown and signet-ring,
To read my title in your eyes, love, clearer,
If I were king—if I could be your king.'

Tears of a strange happiness wet the girl's lashes; her prince of yesterday was every inch a king to-day. With all the native trustfulness of her nature she put both her hands in his.

And thus the captain of the Strathmore Guard won Maddie Buchanan.

---

# PRACTICAL HINTS ON AFFORESTATION.

THERE are signs that the question of afforestation is reaching the sphere of practical politics, though Mr John Simpson, in his new book, *British Woods and their Owners* (Pawson and Brailsford, Sheffield), states emphatically that the proposals of the recent Afforestation Commission are outrageously extravagant, and out of proportion to its professed object, which was to consider whether it was desirable to make an experiment in tree-planting as a means of increasing employment during depression. A better method, he thinks, would be by a system of State forestry as in Germany. The question of afforestation should stand on its own merits, apart from the unemployed problem; its advantages are so evident that the State might be well advised in promoting a scheme on a generous scale. Mr Simpson, who is a practical forester and horticulturist, dedicates his book to the landowners of Great Britain, with whom, he believes, lies the future of British forestry.

Of Mr Simpson's previous very illuminating and instructive volume, *The New Forestry*, there was a notice, 'Forestry for Beauty and Use,' in this *Journal*

for 1900. This new book has been issued to prompt private owners to bestir themselves, as little help may be expected from the State for a long period. Practically the whole of the woods of Great Britain and Ireland are owned by private individuals, who maintain them at their own expense. But owing to lack of funds and proper management they are of far less value to their owners than they might have been. On some estates the woods are a dead asset, yielding no income to their owners; others have been so gutted that no more trees can be spared out of them. The great lack on private estates is system and supervision. Even though the State did not work the forests, as it does in Germany, it might make forest-laws, as there are game-laws and land-laws.

Mr Simpson says that 'as yet no favours bestowed by the Government on behalf of forestry have touched our British woods. The only piece of legislation that has left its mark has been the Death Duties Act, which has caused, and is causing, the destruction of standing timber on estates on a scale that was neither foreseen nor anticipated, which has thrown people out of employment, and arrested planting on a proportionate scale. There can be no doubt that if a record could be had it would prove this, and that not only has much mature timber been sacrificed to meet death duties, but much that was immature and unfit, or too young to cut as well, and the removal of which could only do injury to the crop left by over-thinning. If the timber-trade papers are watched, it will be seen that timber sales on estates follow the demise of owners in a great number of cases.'

Few things strike the visitor to Sweden and Germany more than the mountains covered to their summits with fine woods, in strong contrast to our own bald hills. The pictures in this book and in *The New Forestry* bring the difference graphically before the reader. The great Thuringian forests cover 26 per cent. of the surface of the land, only 5 per cent. of which is unproductive. There are corresponding areas in the United Kingdom lying entirely waste. The remarkable prosperity of Finland is largely due to its wealth of timber, some 90 per cent. of the country being covered with woods largely belonging to the State. Germany had forests to begin with; what the State did was to take them under its care, private owners being glad to conform to State supervision. About half the private forests are under State supervision. The United States is adopting this system, and the number of technically trained foresters is on the increase. The nursery area of young forests is also being increased, this being an absolute necessity, as the United States is now using as much wood in a single year as grows in three years, with only twenty years' supply of virgin growth in front. The Pennsylvania Railroad Company has introduced a forest system on its own lands. In the undergraduate forest school in Center County, between Michigan and Maine, a four years' course is given in every branch of forestry, which is taken up in connection with the work of the agricultural and mechanical department of the State University. The students study in a most practical way in forest reservation areas; they learn camp-life, the use of pack-animals, ponies, and mules, and the estimating of timber. There is a constantly increasing demand for trained foresters in the United States Forest Service. Tree-planting is being systematically carried out on the Massachusetts roads; in five years thirteen thousand trees had been distributed amongst fifty-five towns. German villages, like Cronberg and Konigstein in the Taunus, owe much of their beauty and attractiveness to the tree-planted highways. Mr Rockefeller purchased from Boskoop, Holland, in 1909, some thirty-five thousand blue spruce, coniferæ, cultivated by Koster, for planting in a park in which he was interested in the United States. Since 1900 the Canadian Parliament has established twenty-one forest reserves. In New South Wales a department has been created in the interest of conserving forest reserves. The forestry report of 1909 from New Zealand is not reassuring; it was estimated that there was timber to last the sawmills for about thirty-five years, after which the country must look to Canada or Manchuria for pine.

Mr Simpson points out that in England and Wales alone there are nearly two million acres of woods demanding the immediate attention of the State to save them from destruction, as also three and a half million acres of mountain and waste land far more fit to plant with a greater variety of trees than any land of the same kind in Scotland. British foresters have never had clear ideas about rotation periods, final crops, or density. A solution is proposed of the planting difficulty. He writes: 'In clear felling and complete replanting, one advantage of making a clean sweep of the old standing crop is that more money is realised, the felling and hauling harrows the ground well, and there is no better rooting medium for young trees than the virgin surface soil of an old wood covered with the humus deposited on the surface perhaps for generations. Clearing also affords a chance of succeeding one crop with a crop of a different species. The author would rather follow an old wood with a different species in the virgin soil than plant on the best sod or fallow or pasture he ever saw; and all old woods are in that condition, though it does not appear to have struck foresters much. By this method all the most profitable species may be used—light-demanders or shade-bearers. Indeed, the whole of our forest trees succeed best in the full light of the sun, and in clear cutting and planting they may be either mixed or pure. In adopting the scheme here advocated, clear cutting is to be preferred. The larch, all the pine family of the Scotch fir and Corsican class, the ash, oak, sycamore, elm, alder, birch, are all light-demanders in a greater or less degree. They may exist for a time under

the partial shade of other trees, or so crowded together in pure plantations as to shade each other injuriously; but the fact has been established beyond doubt that, consistently with the proper density of crop to secure clean timber, the more favourable the aspect and the more sunlight the trees receive during the whole of their life the more rapid the increase of trunk-volume, the more profitable the crop, and the shorter the rotation period.'

It is fir timber that consumers want more than any other. The Japanese and common larch and the Douglas fir would meet the demand. This last surpasses all the rest of our forest trees in rapid growth and increase of trunk-volume. Good examples may be seen on the Murthly estate, and at Taymount and Scone, in Perthshire. The Japanese larch is immune from larch disease. Some planted in 1886 near Dalbeattie are now fifty feet high and twenty-nine inches in circumference breast-high. Young plantations do not need wire-netting for more than four or five years to preserve them from destruction by rabbits. It is the first two winters that are the critical period. The Germans draw the line at a few useful species—mainly beech, spruce, and Scots fir. Larch, Douglas fir, oak, ash, sycamore, alder, black poplar, and willow are all profitable trees. Larch tops the list in usefulness.

Sir Arthur Bignold has shown a good example in tree-planting. In the course of the past thirty years he has planted eight million four hundred thousand trees, and he gives eight hundred feet as the maximum height where they flourish. Sir Herbert Maxwell thinks one thousand feet not too high. The German forests are luxuriant at a much higher altitude. Professor Somerville has pointed out how, in spite of the use of concrete and iron, the demand for timber continues to grow, while it seems unlikely that the chief timber-exporting countries can maintain their supplies for export. It is the interest, therefore, of every country to prevent wasteful destruction by forest-fires, to see that denuded areas are regenerated, and to undertake the planting of all available land with the right kind of trees. On the other hand, Sir Robert Hunter, in the first issue of the *Local Government Review*, writes upon 'Afforestation of Commons,' criticises the Development Bill, and says there seems a danger that many commons may become fir-woods through the absence of adequate means of protecting the commoners' interest in their pasture.

Meanwhile some large newspaper firms, anticipating the scarcity of timber and supplies of paper-pulp therefrom for the manufacture of paper, have made provision for the future. One company has sunk over a million sterling in the purchase of virgin forests of spruce-trees in Newfoundland, and pulp-mills have been erected, worked by electricity generated by water-power. A township is growing up around the works on the River of Exploits. When trees are cut down others are planted in their room. The proprietors of the *Daily Chronicle* and *Lloyd's Weekly News* get their pulp from their own mills at Honefos and Vittingfos, in Norway, and it is shipped from the port of Drammen. They also get quantities from Canada. The trees are felled in winter, and conveyed on sleighs drawn by horses or oxen to the nearest river, where they lie till the thaw comes in the month of April. At Honefos, thirty miles to the north-west of Christiania, Messrs Edward Lloyd, Limited, have their pulp-mills, which convert trees into pulp at the rate of sixty thousand tons annually. From thence it is brought to the paper-mills at Sittingbourne, Kent, which have an output of one thousand six hundred tons of finished paper every week.

## WHO OWNS THE HUDSON BAY REGION?

By P. T. M'GRATH.

THE alleged discovery of the North Pole, and the consequent claim that, the Stars and Stripes having flown there, the flag can never be lowered again, raises anew the question of the right of Canada to control the region north of Hudson Bay and exercise sovereign authority over the lands and waters there.

In the Canadian Parliament on March 10, 1905, in discussing the alleged American movements in Hudson Bay and adjacent lands, Sir Wilfred Laurier observed:

'We are aware that the Americans have been patrolling northern waters and giving American names to some of the territories there which I think are under our jurisdiction. We have already provided against that by sending an expedition there, which has just returned after planting the British flag on many parts of these northern lands. We cannot allow Americans to take possession of what is British territory, and we intend to assert our jurisdiction over it.'

This question may prove the most menacing to Anglo-American relations. Canada's assertion of sovereignty there and her measures practically to enforce her claims mark a new phase in her history. The expedition mentioned was sent north in July 1903, in the steamer *Neptune*, under Commander Low, to annex all the lands which could be reached. The *Arctic* followed in 1904, with Major Moodie, commissioned as Governor of Hudson Bay, and with North-West police to establish permanent posts and enforce Canada's laws there, and she has made annual trips to the region ever since.

Canada pleads that she has been forced to these drastic measures by the Alaskan Boundary Award, the bitterness against which is not likely to be allayed for many years. Fearing disputes hereafter as to the rights of both countries to this mighty unexplored northland, with a possible further loss of territory to her, she would prevent such by the precautions now taken. Especially is she impelled by her new transcontinental railway being designed to relieve her from dependence on American seaports and to afford an outlet for Western grain through Hudson Bay. Hence she would not desire traffic there to be menaced by foreign guns, as it was feared for a time Port Simpson, the Pacific terminus of the new railway, would be dominated by the islands which the Alaskan Award gave to the United States.

The impression which generally prevails that Hudson Bay and its surrounding lands are completely enshrouded by ice and snow is altogether erroneous. Sir Sandford Fleming, the distinguished engineer who built the Canadian Pacific Railway, in advocating a branch line to that bay, says:

'Moose Factory, on the margin of Hudson Bay, has a winter and summer temperature the same as Winnipeg, and the average snowfall is less than half that of Montreal and Quebec. Looking forward but a few years, the Dominion may come to possess in it a new seaport. Archangel, the Russian port, is on a parallel of latitude of thirteen and a half degrees, or more than nine hundred miles farther north than Moose Factory. Archangel is a seaport of importance, with a dockyard and a prosperous shipping trade. Its population is not inferior to some of our Canadian cities, and before the founding of St Petersburg it was long the only seaport within the limits of Russia. Can any person now living foretell what Moose Factory may yet become?'

Nearly the whole northern half of the continent, described as Rupert's Land, after the Prince Rupert, the first Governor of the Hudson Bay Company, was at the outset embraced within the domains of that corporation, which was formed in London in 1670, and received from Charles II. a charter granting it greater powers than have been bestowed on any company ever formed for overseas enterprise before or since. They included, according to the original patent:

'The whole, entire, and only liberty of trade and traffic of all these seas, streights, bays, rivers, lakes, creeks, and sounds, in whatsoever latitude they shall be, that lie within the entrance of the streights commonly called Hudson's Streights, together with all the lands, countries, and territories which are not now actually possessed by any of our subjects or the subjects of any other Christian Prince or State. The fisheries within Hudson Streights, the minerals, including gold, silver, gems, and precious stones, shall be possessed by the company. It shall enjoy the right to seize upon the persons of such English or any other subjects which sail into Hudson Bay, or inhabit any of the countries, islands, or territories granted to the said company, without its leave and license in that behalf first had and obtained.'

The French, who were already established in Quebec, and had partly explored the interior, stoutly resisted this sweeping appropriation, and the efforts of both to control the rich trade in peltries and game led to bloody encounters, until by the Treaty of Utrecht in 1713 France had to abandon the region and recognise British sovereignty there. But in subsequent conflicts the war was carried on in that region, and as late as 1772 the French ravaged the bay and captured some of the forts. In 1812, again, when England and America were at variance, several fur-ships were plundered; but the Treaty of Washington in 1818, which granted Americans equal fishing-privileges with the British subjects along the Labrador and 'northward indefinitely,' declared these to be 'without prejudice to the rights of the Hudson Bay Company.'

Upon the ground that the rights were absolute and all-embracing virtually rests Canada's claim to the northland. But this is the one point which has never been properly determined. More than a century ago rival corporations strove for a foothold there, and became successful competitors. Lord Strathcona, the present Governor of the company, and Canada's High Commissioner in London, in a paper read before the Royal Colonial Institute in 1897, dealt thus guardedly with this aspect of the matter: 'The Hudson Bay Company claimed that it had the right to the whole of the territory included in the charter, and to the exclusive trading therein. This was, however, disputed, and the difficulties were indeed never satisfactorily settled until peace was rendered possible by the amalgamation of the rival companies in 1821.'

This charter, it should be noted, gave the company rights not alone over Hudson Bay itself, but over all lands and seas clear through to the Pacific Ocean which could be reached by means of a 'northwest passage' made *viâ* Hudson Strait, and therefore the company's rights, whatever they might be, would be as effective along the coast near Alaska or in the Arctic Circle as in Hudson Bay itself.

Lord Strathcona, however, does not maintain that these rights were monopolist, for eminent British authorities, after the grant of the charter, questioned its validity on the grounds that King Charles gave away a vast territory of which he had no conception, and that it was impossible to transfer property which could not be described. Then the company was successfully assailed in its operations by different rivals until eighty years ago. Canada, forty years later, opposed the theory that the company possessed such absolute privileges as it claimed, and again there was never any effective occupation of the northern seaboard of the territory.

Obviously, then, if the company did not possess an effective monopoly of the furring-rights of the region, it did not possess kindred fishing-rights either. American subjects, in the exercise of a privilege granted in 1818, could cruise up the

Atlantic coast and enter every inlet, among others Hudson Bay itself, unless the monopoly was effective. But if it were effective British subjects could not enter there either, the company's charter being equally directed against them. If this contention were accepted it must follow that British fishermen had no legal rights in any waters within the jurisdiction of the Hudson Bay Company, or else that when British fishermen were admitted there American fishermen should be granted the same liberties.

The next stage in the matter is thus described by Lord Strathcona, in the paper already quoted from:

'The march of events began to interefere with the virtual monopoly the company had enjoyed for many years. In 1857 a select committee of the House of Commons was appointed to consider "the state of those British possessions in North America which are under the administration of the Hudson Bay Company, or over which they possess a license to trade." The committee reported that whatever might be the validity or otherwise of the rights claimed by the company under the charter, open competition in the fur-trade might tend to demoralise the Indians, and bring about the total destruction of the most valuable of the fur-bearing animals. Finally, in 1869, an agreement was arrived at by which the company consented to accept one million five hundred thousand dollars for the surrender of the territories to Canada, through the Imperial Government.'

In the foregoing extract it will be again seen that doubt is thrown upon the company's exclusive rights, and as the Scotch whalers began frequenting Hudson Bay in 1829, more than forty years before this transfer of authority took place, it is clear that this 'monopoly' cannot easily be maintained. No attempt was made to prevent these whalers, nor the Americans who soon followed them, from operating there; and from that time to the present day the Americans have continued to prosecute this industry without hindrance. Moreover, the United States and Great Britain differ in their interpretation of the famous 'headland' doctrine in maritime matters. The British view is that all waters within a line drawn from headland to headland are embayed and constitute a territorial area, the *mare clausum* (or closed sea) of diplomacy. The United States does not subscribe to this, though the entrances to Boston, New York, and Philadelphia might be held to bind her thereto. In the Alaskan dispute one of the main questions was as to the sovereignty of the headwaters of Lynn Canal, and involved this very issue.

Hudson Strait, the entrance to Hudson Bay, is forty miles wide and five hundred long, and the bay itself is the third largest sea in the world, only exceeded in size by the Mediterranean and the Caribbean, the area of the first being nine hundred and seventy-seven thousand square miles, the second six hundred and eighty thousand, and the third five hundred and sixty-seven thousand. As no attempt has ever been made to hold the first or second as the exclusive possession of any one Power, it is contended that the claim of Canadian ownership of Hudson Bay is not tenable, especially as the American whalers have been practically the only inhabitants of its western shore for sixty years past. If the American right to fish along Labrador and 'northward indefinitely' is valid, it gives these fisherfolk the right to operate along Baffinland and to the North Pole itself; and, inasmuch as they would have authority to enter every estuary more than six miles wide, it would seem as if they could not be successfully prevented from fishing in Hudson Strait or Bay. The northern extremity of Labrador and the southern point of Baffinland form the entrance to Hudson Strait, and according to the ancient view no ship but the company's could go west of a line drawn between Capes Chidley and Resolution, the two promontories in question.

That Canada can maintain this view is strongly disputed by students of the question for the reason already presented. Moreover, while Baffinland and other Arctic areas are claimed as British territory, the exploring, charting, and naming of much of the northern hinterland there has been the work of American explorers, who have done similar service in Beaufort Sea and Mackenzie delta, east of Alaska. These facts, then, coupled with Canada's failure until the last few years to attempt any effective occupation of these remoter areas, and the implied admission of insecure tenure in reannexing the territory, make a questioning of the validity of her jurisdiction by no means unreasonable.

Canada, however, views this matter of regaining her hold on the northland from a national standpoint, and the subject of her rights and authority there has become one of deep and vital interest to all her people. Her public men are only now awakening to the value of the fishery, peltry, forest, mineral, and agricultural wealth of the Hudson Bay district, the area of which is estimated at one million five hundred thousand square miles, comprehending every variety of soil and climate. The bay itself yields the northern whale, so prized for its whalebone (a single adult specimen being now worth fifteen thousand dollars), the white whale or grampus, the narwhal or sea-unicorn, the walrus, five species of seal, and thirty kinds of edible fishes. The peltries of the sea and shore have remained undiminished after nearly three centuries of slaughter, and the Hudson Bay Company spends two million dollars there every year in the purchase of furs alone, the most famous being those of the bear, fox, wolf, moose, caribou, wolverine, lynx, sable, ermine, marten, mink, otter, and the renowned beaver.

In the southern section husbandry is practised, in the west lies the fertile belt with its teeming grain-fields, and beyond is the ranching country, the products of which promise to create a new transportation problem erelong. The forest pro-

ducts include three varieties of pine and spruce, two of elm, ash, poplar, and birch, and one of aspen, tamarack, and fir. Smaller growths suitable for pulp-making abound also, and as the woodlands available in more southern latitudes become depleted these must be levied upon. The existence of such minerals as hematite and pyrite iron, copper, silver, gold, mica, gypsum, antimony, asbestos, and coal has been determined; and if the precious metal should be found in workable quantity there is likely to be an eastern Klondike established on these lonely shores, with a rush of settlers there such as follows every new discovery of auriferous areas anywhere in the world.

But transcending all other arguments in its bearing upon the future development of Canada's northern heritage, and her desire to preserve her coastline from foreign interference, is the pressing need for some outlets for the products of her great prairie country. The rapid opening up of the North-West, the peopling of the wilds, the marvellous increase of the wheat crop, and the mighty railway project, all point to Canada soon bulking larger in the eyes of the world as a commercial factor than she does now. To enable her to profit to the fullest extent from this improved position it is urged that she should utilise the Hudson Bay route as she does that *vid* the St Lawrence.

The case for the Dominion is that Hudson Bay is to Canada what the Mississippi is to the United States. It lies in the very heart of the continent, and is completely surrounded by Canadian territory. For two hundred and thirty years it has been as uninterruptedly a British possession as Chesapeake Bay has been American territory for one hundred and thirty years. Against Canada's plea of exclusive possession it is urged that there is no fixed rule as to what constitutes a closed sea, and that other nations made extensive claims at times to exclusive maritime jurisdiction, but had to abandon them. Thus England once claimed the North Sea and the Atlantic Ocean north of Scotland, Venice in her days of power held the Adriatic as a closed zone, and Denmark and Sweden asserted the same as to the Baltic. Spain, most grasping of all, claimed the entire Pacific Ocean and the western half of the Atlantic, including the Gulf of Mexico. Britain, until midway in the last century, claimed the Gulf of St Lawrence, the Bay of Fundy, and the Cabot Sea off the south coast of Newfoundland. Lord North, in the Imperial Parliament in 1775, introduced a bill to prohibit the revolted American colonists from fishing on the Grand Banks of Newfoundland. Russia, down to the sale of Alaska to the United States, maintained Behring Sea as within her exclusive jurisdiction, and the United States then did the same; but the tendency of modern times is to limit exclusive jurisdiction to waters within three miles of the coast, and the United States' claim was rejected by the Paris Arbitration of 1894.

But, in the argument as applied to the above cases, none of the claims were based on geographical and territorial facts analogous to those existing as to Hudson Bay. Although it has the dimensions of a sea and is connected with the Atlantic by a strait of varying width, the entire bay and strait are within the territory of Canada. Apart from territorial claims, her obvious interests, Canada asserts, form as good a claim to jurisdiction over it as the demand of the United States for an exclusive sea-area around the Pribylof Islands, not on account of territorial rights, but because of the value of the seal-rookeries on the shores.

With regard to the Hudson Bay route, the bay itself is so vast an area that it is never fully frozen over, but the strait is congested with ice for some months of the year, though at least seven hundred voyages have been safely made in and out of the bay by small vessels belonging to the Hudson Bay Company. The navigable period of the strait is variously fixed from three to five months for specially built steamers, and the interesting of capitalists in the venture must depend upon the facts provable as to its feasibility. The project will be one of interest to the American as well as to the Canadian West, because of the possibilities for a new grain-route which it embraces. A vigorous campaign for the development of Hudson Bay might stimulate the United States to advance claims to the region which might enable her to share therein; while, on the other hand, she would probably be indifferent if the prospect were not encouraging.

Canada, however, in any event, has determined upon an effective occupation of her northland in future, and by means of revenue cruisers, police patrols, and armed posts throughout the region, will give visible evidence of her jurisdiction, with the twofold purpose of securing to herself and her people all the future wealth of the region and of preventing another diplomatic entanglement like the Alaskan boundary dispute.

## SILVER AND GRAY.

Silver the shine of the moon on the wave,
Burnished the path of the light on the sea,
Gray looms the shore where the tides gently lave,
Lichened the walls of the church by the quay—
Silver and gray.

Silver the catkins on willow-tree shake,
Lonely the graves midst the whispering grass,
Silver the stem of the birch in the brake,
Eerie the cry of the gulls as they pass—
Silver and gray.

Hope for the morrow, though dark be the hour;
Get thee thy trappings, why garb ye in gray?
Courage keep alway when battle-clouds lower,
Silver a broadsword to wield in the fray—
Silver or gray?

# THEIR LOVE-STORY.

By ROSALINE MASSON.

PART I.

THE girl stepped out of the window on to the dark terrace, and stood quite still for a moment, drinking in the delicious peace of the summer night. The ball she had left was at its height. The supper-rooms had been thrown open — it was just midnight — and were crowded, and full of the noise of talk and laughter, the clink of glasses and dishes, the popping of champagne-corks, the hurrying to and fro of busy servants. The ballroom was comparatively empty; but one or two who loved dancing were still taking advantage of the clear floor, and were gliding on its polished surface to the dreamy music of the string-band. It was the picture-gallery that had been turned into the ballroom, and the walls were covered with family portraits, the proud and fair of many a bygone generation of Dabridgecourts. Some of the pictures were by unknown artists, popular in their day; but here and there came a painting by Van Dyck, by Janssen, by Lely, by Kneller, a sombre Rembrandt, a blue-sashed Romney. High above their frames a wreath of evergreens was festooned round the cornice, whence it trailed off down the carvings of the balustrade of the broad stairway, and lost itself among the flowering shrubs that half-concealed the band, just where the staircase curved into the centre of the gallery.

Edith Dabridgecourt could hear the strains of the waltz-music where she stood on the terrace, and could distinguish the more distant talk and laughter of the supper-rooms. She stepped a little farther out into the night to avoid the sounds, and leant on the white stonework that edged the terrace, and looked across the dark, shaven grass to where the dusk deepened into gloom and hid the familiar country. Suddenly the moon edged through the clouds, and struck her where she stood, making the stone she leant on pale as marble, and playing tenderly with her gleaming satin and pearls. Again she moved away, flitting like a ghost, gliding down the steps from the high terrace to the lower one, and taking refuge in the shadows below. She wanted to be alone, this modern maiden whose twenty-first birthday was being celebrated so royally in the house she had just left. She was very modern, this descendant of a long line of Dabridgecourts, this heiress of an ancient name. She found life at home dull after three strenuous years at Newnham, full of the excitements of physical and intellectual endeavour, of examinations and contests and emulation, of debates and hockey-matches and tripos, of talk and freedom and opinion. She had returned home; and, after the first thrill of delight in the æsthetic grace of it all, she had not been satisfied by tennis-parties, nor by the drowsy mornings in the old village church under the rotten oaken rafters, amid all the tablets to the memory of her ancestors. Even the advent of a lover was to Edith Dabridgecourt nothing more than another possession, to be taken for granted, to give at first (like other possessions) an artistic satisfaction as an æsthetic property in life, and then to cause embarrassment. After all, Sir Edward Lennard was only part of this new life that was so old a life. He was a neighbour, and the rest of the landscape belonged to him. He even shared the traditions with her, for the Lennards, when not compared with the Dabridgecourts, had been long planted on the soil.

As Edith stood in the moonlight she tried to focus her thoughts, and a frown gathered on her broad white forehead. Her friends—all those adoring college chums who had gathered in her study and drunk coffee with her, and talked of all matters under the sun and beyond their knowledge—had been wont to tell her that she was like a 'Dana Gibson girl,' for she was tall and generous of build, and she wore her dark hair parted, not always evenly, and brushed simply off her broad forehead above her great dark eyes, and the dainty chiselling of her little nose was not more adorable in its result than

[*All Rights Reserved.*]

were the mobile curves of her rather too large mouth. But had these college friends seen the pictures in the gallery of The Chase then they might have recognised the same features appearing and reappearing through the centuries, all in different disguises—the square forehead concealed by the 'kissing curls' loved by Charles the Second beauties, or surmounted by the vast structures of powdered hair and pearls and roses of Georgian days, or demurely draped by bunches of the ringlets that were the care of Victorian matrons. 'Even my face is not my own!' Edith Dabridgecourt had exclaimed after a long, wet morning spent in the picture gallery. 'What is the meaning of it all? How much are we ourselves, and how much are we simply transmitted ether and radium? I wish I had taken psychology for my final!'

By a touch of irony on the part of Fate, it was Sir Edward Lennard who had brought the breezy American to her. Edith had seen him first in the morning-room, where she had found both young men talking to her mother. She had glanced casually from one to the other as they rose on her entrance, and suddenly—meeting in her straightforward, simple fashion the equally straightforward look of the tall, fair stranger—she had felt that in this man whose very name she had not yet heard, whose identity was unknown to her, she had met some one before whom all others—her parents, her lover, even those dear girl-friends with whom she had shared every thought and combated every opinion—were strangers indeed. As she gave him her hand she smiled; it was all so simple, so natural! And he—the directness of his scrutiny too grave to be rude—smiled suddenly in response a brilliant smile that lit up the clever, thin, civilised face.

Edith had moved slowly through the heavily curtained doorway into the drawing-room, and had bent over the cups on the tea-table. Sir Edward had followed her, and had stood waiting to receive them, talking idly in a lowered voice. Presently she began to listen.

'Curious, isn't it?' he was saying. 'Daybridge—of course it is the same name—a corruption. He's awfully keen on hunting it all up. The vicar introduced him. He seems a very decent chap. Then it turned out he got an introduction to your father from some one in London to whom he had brought letters from some bigwig out there. It ended in our walking over together.'

'Do you mean that he claims relationship?'

'Well, relationship is rather a strong word. It was a century or two ago. These Americans are awfully interested in tracing their families, aren't they? I never feel in the least drawn to mine. I knew a man'——

'Edith dear, ring and send a message to your father,' Mrs Dabridgecourt had interrupted in her gentle voice, entering from the other room as she spoke. 'He will be very much interested in what Mr Daybridge is telling me.'

The young American strode forward as she moved towards the bell, and again their eyes had met. Edith could have laughed, the thing was so patent, so wonderful, so ludicrous! They were no strangers; the rest of the world were strangers to them both. Their lives and their thoughts fitted as the two splintered edges of a broken vase fit when put together again.

Mr Dabridgecourt was very much interested. He carried the American, with his strong, likeable face and his slightly nasal accent, off to the library, where the tables were soon littered with old volumes and with cherished manuscripts.

Afterwards Mr Dabridgecourt told his wife and daughter that he held it was genuine—perfectly genuine; and that Mr Arthur Daybridge from Baltimore was the direct descendant of the elder branch of the family, who had lost the estate in the Civil War time.

'My love, does this young stranger claim his heritage from us?' the gentle old lady asked.

Her husband waived the idea aside. 'It rests a great deal on assumption,' he said. 'You know an Arthur Dabridgecourt fell at Worcester. We have his portrait. Well, he left a son, an infant presumably. Nothing more is heard of that infant in the family annals, for the estate was confiscated, and passed to the younger branch of the family, who were Cromwellians and my ancestors.'

'But why, if there *was* an elder branch, did they not claim it back at the Restoration?' Edith asked.

'Well, my dear, they did not. There is no record of any claim. The son could have been only a mere child, you see; and no doubt they were poor, and justice would have been expensive. But this young Daybridge claims descent from him, for it appears he can trace his family back to 1722, when an Arthur Dabridgecourt emigrated to Virginia. It rests chiefly on the name, and on the fact that he was a native of Buckinghamshire; and our Arthur Dabridgecourt married a Buckinghamshire woman. It seems more than likely that the widow went back to her own people, and that this emigrant of 1722 was the son's son. Also, he says that Cicely was a family name with them, and so it is with us.'

Mr Daybridge and Sir Edward Lennard dined with them next day, and spent the greater part of several days with them; and old Mr Dabridgecourt grew full of talk and excitement over the matter of the relationship—more so, indeed, than the young claimant himself, who seemed more interested and absorbed by the place itself, and the wonder of old tradition, old pictures, old trees, old ways, old names—all the fetters of the past and its continual presence, its unforgettable claim.

And now, on the night of the ball—the ball given in honour of Edith's majority—the American was amongst their guests, and was being introduced by their old host, half in earnest, as a kinsman. And Edith Dabridgecourt had slipped out into the night—the fragrant, warm silence of the summer night—to be alone with her thoughts.

Sir Edward Lennard had proposed for her and to her; he had come to her armed with her father's hearty consent; it seemed it was a thing regarded as settled inevitably, like so much else in her life. He had, she learned, waited for her all the three years of her erratic search after learning and freedom, and he had meantime been as a son to her parents in their retired life. All the neighbours knew of his hopes. It but wanted Edith's consent; and if this consent could be given now, then this ball would be in honour of a double event—her majority and her engagement. But Edith had begged postponement; the last prayer of the doomed and of the wooed was hers—she asked for time, and it was given. The women of the Dabridgecourt family had always been hard to woo and faithful when won.

Edith put her soft white arms round a little marble pillar that held a sun-god from Italy, and pressed her hot cheek on the cool, moonlit stone. A sudden thought had sent the blood coursing into her cheeks. A week ago, she owned to herself, she had been ready to drift into this marriage simply because then she had had no reason against it weighty enough to outbalance the wishes of every one else; but now, why was it different? It was because she had a reason. She straightened herself proudly. Had she given unasked, undesired? And then she smiled with that beautiful mobile mouth of hers. Was it only three days since they had discovered each other, or was it three centuries ago?

Undesired! Again the old feeling swept over her. They understood each other so well that to them the rest of the world stood aloof: and yet no word had been said. It mattered little what they talked of. What had they talked of? He had told her of his life in America. He had treated her with that singular deference that the New World accords to a young girl; not only deference to her as a woman, but recognition of her as an individuality, as the possessor of a soul and a mind. And in his talk he had touched, as a matter of course, on all the themes that had interested and fascinated her, that she had let her young judgment work upon, that she had imagined in her splendid young egoism to be her own. He had even used the very words and expressions she used, and had used them to convey the same ideas. This was not what her own family, nor Sir Edward Lennard (who aspired to become her husband) ever did. Mr Daybridge had taken for granted her college career, a thing that had hitherto provoked surprise, amusement, or distaste. He had asked her if she 'contemplated entering any profession,' and had given a humorously apologetic shrug at the consternation he had thus afforded her parents.

'Would you allow your sister or your wife or your daughter to do such a thing?' Mrs Dabridgecourt had asked him with gentle correction.

'Oh, my *wife!*' he had responded, with a slight accenting of his American speech. 'After she had allowed me to call her by *that* name the pronouns would never again get properly assorted on either side of the verb "allow."'

But to-night, the night of the ball, the talk had been different. Instead of taking her into his life he had come into hers. They had waltzed together, waltzed in silence but in wonderful accord. When the dance was over they had gone, as if by mutual consent, to one end of the picture gallery, where hung a little, dark portrait of that young Arthur Dabridgecourt who had fallen at Worcester fighting for his king. The portrait was very dark and faded, the paint crusted and cracked; it was not a valuable portrait, but only one 'after Van Dyck.' The coat of the young Cavalier had been blue satin, and the ruffles at neck and wrist showed dimly the rich pattern of the lace, though the white had turned yellow. The curled hair fell on the lace, and the long waxen fingers rested on the handle of his sword. The blue of the satin was dimmed, the lace was yellow, the hand was dead; but the eyes—the sad eyes, eyes as sad and full of nobility and dignity and as haunted as the eyes in the portraits of his unhappy monarch—the eyes were alive. And the girl, looking from the portrait to the man beside her, had laughed nervously a little laugh that ended in a shiver.

'Do you see it?' she had said. 'You could claim our name and The Chase for this alone! Tell me, do you like it? To come across the world from your land of liberty and freedom and individuality and find your very features—and if your features, then who knows how much else besides?—are not yours, but are only lent to you!'

Then he had smiled at her suddenly, tenderly, humorously. 'Liberty, freedom, and individuality! Is that what you crave for? And I, coming out of the garish tastelessness of modern life, the "bustle of man's work-time," the rush and heedlessness of it all, the self-seeking, the lack of enthusiasm, the want of interest for the real things, the interest only in the passing moment, the money-talk, the—— Oh! I crave for the past—its leisure, its strong aims and simpler passions, its reverent faith, its poetry, and perhaps also'—he lowered his voice and looked away from her as he spoke—'for one of its poems.'

'You are not a typical American,' she said lightly.

He pointed with his hand to the portrait above them. '"And if the features, then who knows how much else besides?"' he quoted.

She looked at him, and the smile died from her eyes, and she bit her lip to keep it from trembling. As though he read her thought, his face set. Did he remember the story of the portrait, the wrong done, the blot on the 'scutcheon? Of course he knew it! Was it not printed for any who cared to read since the bringing out, a year or two before, of a volume of old family records and letters, a volume the reading of which, young Daybridge had acknowledged to them, had brought him from Balti-

more to trace his connection with the Dabridgecourts at The Chase, in a quiet English valley in the Old World? It was of this story that these two modern young people were thinking, not of themselves, as they stood silently together by the portrait; so that when he asked her suddenly, 'Is there no portrait of Edith Dabridgecourt?' she knew, though it was the first time she had heard her own name spoken by his voice, that he spoke not of her, but of the woman who had loved and died more than two hundred years before, the woman who had so wronged the sad-eyed Cavalier, and whom, alas! the sad-eyed Cavalier had so bitterly wronged.

'No,' she answered. 'Her husband, it is said, burned her portrait.'

Arthur Daybridge raised his broad shoulders, but found the information beyond comment.

Edith's glance had wandered down the length of the portrait gallery, and she quoted sadly:

'Some with lives that came to nothing, some with deeds as well undone,
Death came tacitly and took them where they never see the sun.

Isn't that how it goes—never see the sun? Who knows? They never saw it *here!*' She laughed half-mischievously, half-wistfully. 'It is all shut out by ancestral trees.'

'With us it is sometimes shut out quite as effectively by overhead wires,' he told her. 'Say, Miss Dabridgecourt, don't the features only serve to remind us of our debt and our duty? We inherit the world that was once all *their* world, and if we find it the richer for their lives that were lived in it? And if we find it otherwise, then too—— I feel, somehow, as if I 'd got to carry it on for him, you see,' he added, dropping into his American intonation. 'But where are *you*—where are *you?* Have there been many of you to gladden and grace the centuries?'

'Yes, I am here. Even these!' She touched the pearls at her throat as she spoke.

They turned away, thinking of themselves now, and forgetting to look again at the sad-eyed Cavalier; and they passed down the long gallery, as fair and proud a woman and as strong and true a man as any of those framed on either side of them. And he had glanced at each pictured woman as they went, but without comment. Only, as he resigned her at the door, 'I saw the *pearls*,' he had said, and his eyes for a second had met hers as he said it.

It was after that that Edith had escaped from the heated ballroom, and come out into the night to be alone and to think. But her thoughts, as she stood alone in the shadows of the lower terrace, hiding her hot cheeks in her cool hands, strayed again to the story of the past.

It was a story of tragedy, of hot passions and rash acts; a story of one woman and two men. There had been, in the early days of Charles the First, a happy group of young people at The Chase—a brother and a sister, Arthur and Cicely Dabridgecourt, and their orphan cousin, Edith Dabridgecourt who had been brought up with them. They had played and ridden in this very park, and they had lived in the old Chase, now a roofless ruin in the centre of the rose-garden, and the haunt of bats and owls. When they were older Arthur had gone to Oxford; and then the letters were full of gay doings when the young heir and his companions had ridden down from Oxford for vacation-times to make holiday love to the brilliant Edith and the gentle little Cicely. Later, the letters had told of the engagement of Arthur and Edith, and their wonderful love for each other, and of how Cicely had a vocation and was to become a nun. And suddenly into the midst of it all crashed the Civil War, ruining the home-life of Merry England, dividing houses and wrecking lives. Arthur went out to fight in the Royalist cause, and for months nothing was heard of him.

(*To be continued.*)

## FASHIONS IN WINES.

THE circumstances which tend to make a wine or a particular vintage fashionable to-day are wholly different from those which influenced the popularity of a wine some thirty or forty years ago. In those days a wine found favour according to its merits; a good wine was then always fashionable. Port was probably the most favoured, but a host might safely offer a good claret or even a thoroughly sound madeira or sherry to his guests without apology. But a completely different state of affairs prevails to-day. Different wines come into vogue for all manner of reasons. A well-known doctor, for example, may chance to extol the virtues of a light claret, and then all in a moment light clarets become the rage, which lasts until some other wine receives a like recommendation to popular favour.

Public attention may be attracted to a wine by some chance circumstance such as occurred a few years ago, when a discussion was raised in the press on the merits of old port. During that discussion, and for some little while afterwards, I received more orders for port than I had done in the whole of the previous twelve months. A customer told me rather an amusing story at the time, in connection with this sudden revival of port as a fashionable wine, which illustrates the widely different manner in which wines are judged nowadays from the way they were thirty or forty years ago. The customer in question was rather an old-fashioned gentleman, who still maintained the custom of stocking his cellar very

carefully with well-chosen vintages. He happened to have at the time in his cellar the last dozen of a really wonderful claret of the year 1858, worth quite three pounds a bottle. One night he had a couple of friends to dine with him, and as a special favour opened a bottle of this magnificent claret. 'Now,' he observed after the butler had filled their glasses, 'tell me, did you ever in your life before taste a wine that could come up to that?' The two friends sipped their glasses, looked at one another and then at their host, and shook their heads. 'It isn't bad, old man,' said one; 'but it is claret, isn't it? We are all drinking port now, you know.' For a moment their host was too astounded to speak. When he had recovered himself he got up from his chair with a smile, saying that if his guests would excuse him for a moment he would have a bottle of sound port brought up. 'I sent for a three shilling bottle of port,' he explained to me with a grin, 'and I assure you both of them declared it was a first-rate wine.' No one just now is likely to ask for claret instead of port, for the latter is, next to champagne, the most fashionable wine for the moment, whilst claret has sunk to zero in fashion's favour.

Champagne, by the way, had a long struggle for favour; but when it was accepted by connoisseurs it greatly affected the consumption of port, claret, and other old-fashioned favourites. Champagne was first introduced into this country in the reign of Charles II., and became for a time a very fashionable wine, chiefly because it found favour with that monarch. Only the sweet variety, however, was consumed at that period; and, though it was palatable enough, it was altogether too much doctored to appeal to the taste of good judges, and after a short time it rapidly declined in favour. For a long while it remained tabooed by those, at any rate, who understood the qualities of good wine; but in the reign of George II. several wine-growers made a determined effort to push the sale of champagne in this country, and a much better quality, though still sweet and very much doctored, was put on the market. From that time it became much more popular; and, though connoisseurs rarely touched it, champagne became more or less an established dinner-wine, its patrons being chiefly, however, the rising generation.

In the early seventies of the last century champagne got a tremendous boom, which it owed to the daring of a couple of wine-merchants who were the first to put a dry champagne on the market in this country. Dry champagne, I may explain for the benefit of the uninitiated, simply means the wine in its natural state, unsweetened by any mixtures. The wine-growers who supplied the merchants in question with dry champagne actually refused to let their name appear on the bottles, so strongly did they believe that the attempt to put the wine on the market would end in utter failure. Several wine-growers, as a matter of fact, refused to supply it. At first it looked as if the wine-growers were right. A well-known service club, who were the first to order the dry wine, declared it undrinkable, and for a time the merchants found their consignments of the wine a dead loss on their hands, and were unable to sell it anywhere. The merchants did not despair; they made a point of offering a bottle to their best customers whenever one came to give an order, and pointed out how infinitely better the wine in its pure state must be than the doctored, sweetened mixture. Gradually good judges of wine came to recognise this fact, and in a few years dry champagne had completely displaced the sweet variety, and came to be regarded as a wine to be selected with as much care and judgment as a port or claret. Between 1874 and 1894 champagne boomed tremendously. The vintage of the first-mentioned year was a splendid one, and was followed by the great vintages of '78, '80, and '84, during which period several new firms of wine-growers came into existence, who made their reputation and fortunes by the champagne of their year. Port and claret began to fall away in favour, and it became the fashion at many great houses, in well-known clubs, and at the messes of crack regiments to drink nothing but champagne.

From 1894 the great vogue which champagne had obtained, however, began to decline; and though it still remains what might be called perhaps the most fashionable wine, it has now many competitors for favour in the shape of light clarets, hocks, moselles, and chablis, which are now consumed at the most fashionable dinner-tables. Champagne and claret are the wines mainly consumed at the royal dinner-table; but it is interesting to note that the names of the wine-growers are never seen by the guests, for the wine is either decanted before being served, or, if not, the labels bearing the growers' names are removed from the bottles. This is done simply to avoid giving what would be a tremendously valuable advertisement to the growers supplying the wines to His Majesty, and it is a custom, I believe, now adopted by many people in society. One customer told me some little while ago that he had adopted this custom for the simple reason that if he had not done so people would suspect that he was giving them wine supplied to him free for the sake of the advertisement. Of course, no well-established wine-growers would dream of doing such a thing; but it is probable that a new firm would supply some highly placed individuals with wine, if not actually free, at a greatly reduced price for a time, to bring their name under the notice of the class of people they were most anxious to appeal to.

The habit of entertaining at restaurants which has grown so popular of late years has greatly affected fashions in wines, because it has resulted in most people letting restaurant proprietors form their taste in wine, and the persons who can go to the trouble and expense of stocking their own cellars are yearly becoming fewer and fewer. There are, of course, a number of people who do so still, and who always have their own wine served at a restaurant

whenever they dine at one; but this type of individual is decidedly becoming scarce. The result is that hotel and restaurant proprietors can make almost any particular wine they please fashionable for the moment. At a very fashionable restaurant in the West End of London the proprietor purchased some years ago a large quantity of claret and hock at a very low figure from a firm who were in great financial difficulties at the time, though they are now in a flourishing condition. The wine was laid down in cellars for a couple of years, and then the proprietors of the restaurant began to bring it under the notice of their customers very persistently, with the result that in a short time the claret and hock of that particular establishment obtained quite a vogue. They were by no means bad wines; indeed, the claret particularly was a fine vintage, and was in excellent condition; but it was quite absurd to suppose that the wines were of that rare quality which the patrons of the restaurant in question believed them to be. I happened to have one hundred dozen bottles of claret of the same growers and vintage in stock at the time, for which I would have been quite content to have taken forty-five shillings a dozen; but owing to this temporary boom in the wine I was able to dispose of the lot at seventy shillings a dozen. No doubt the wines supplied at the best hotels and restaurants are usually of a very high quality, though the prices charged for them are certainly high—quite three times as much as would be charged in a club for the same wine. It must, however, be remembered that the prices charged at the most fashionable hotels are maintained in order to keep them fashionable, and to retain a clientèle which would quickly desert it if its charges were made more popular.

Liqueurs have become immensely fashionable of late years, especially among ladies, which is largely to be attributed to the fact that so many women nowadays indulge in cigarettes. Non-smokers rarely drink liqueur. I have a number of customers of the gentle sex who never drink anything but a liqueur after dinner, and this simply to help them to enjoy a cigarette, which they feel compelled to indulge in as a concession to prevailing fashion.

There is, of course, not the least doubt that far less wine is consumed nowadays in society than was the case thirty or forty years ago, and the quality has also declined with the quantity in individual instances. I mean that there are now a number of people who put a class of wine in their cellars which their grandfathers would never have purchased. It is not bad wine; but it certainly has not the flavour, body, or aroma which men of a past generation thought so much of—too much perhaps. There were many men fifty years ago who would sit for days in their wine-merchant's office discussing the merits of various vintages when restocking their cellars, and give the whole subject a care and attention which was in some cases almost absurd. A customer of my father's actually got an attack of illness through the worry caused by the difficulties he encountered in deciding upon the respective merits of three port-wines when restocking his cellar.

Nowadays the first thought which enters a man's mind when stocking his cellar is to keep down the expense of the operation as far as possible, and he can purchase wines of excellent quality at a reasonable cost. They may not be so wonderful wines as the 1812 port for which was paid fifty pounds a dozen, or that famous claret that cost the late Lord Lamington seven pounds a bottle, and was considered a bargain at the figure, but they are good value for the money, and not one in a hundred, or rather a thousand, could detect the difference between, say, a port at fifty shillings a dozen and '47 port which fetched about twenty-five pounds a dozen the last time some came into the market.

The fact is, the possession of a really valuable wine no longer gives men a distinct social reputation, as it did in the days of our grandfathers, when a man would be often spoken of as So-and-so, 'who has some of that '12 port or '15 claret in his cellar.' Nowadays it is only enormously wealthy people who care to lay down wines of very high quality in their cellars; and many of them do so as a speculation, or rather as an investment, for a well-chosen wine of good vintage will always pay for the keeping. But the number of people who can afford to leave money idle for ten or twelve years is not very large nowadays.

---

# LAURISTONS.

### CHAPTER XIX.—HOW JOHN SAX OPENED THE CUPBOARD-DOOR.

BERKELEY wrung Charles's hand sympathetically as he went down the stair. 'He has gone, full of years and honour, Sir Charles'—at which Charles's lips tightened; 'and you will follow in his steps and carry on the traditions of the house that were dear to him. That, I judge, was on his mind.'

'Yes,' said Charles brokenly. 'I fear he was troubled by the thought that I might wish to return to the army. But nothing was farther from me.'

'The bank must have a Lauriston at the helm,' said the doctor weightily. 'A great career lies before you, my boy, and you carry every one's confidence.'

Charles shook his hand gratefully and closed the door quietly behind him.

'Is he gone, Mr Charles?' asked Simmonds at his elbow. He had sent the others off to bed, but anxiety for his master had kept him up himself.

'He is gone, Simmonds.'

And the tears ran down old Simmonds's cheeks.

'He was a good master, almost a friend, if I might make so bold as to say so, Mr—I mean Sir Charles. We shall all miss him. You most of all, Sir Charles.'

'Yes, we shall miss him sorely. But these things are beyond our control, Simmonds. Do you know where Miss Lauriston is?'

'She is in her room, Sir Charles.' And Charles went up to break the news to her.

When he got back to his father's room John Sax was still standing by the bed, looking down at his old master's body with a white, set face. He raised his woeful eyes to Charles as he entered, and then pulled himself together with a visible effort.

'We may not grieve too much, dear John Sax,' said Charles, laying a kindly hand on his shoulder.

'God rest his soul!' said John Sax in a voice that was strange to Charles, who had known him all his life. 'I have much to say to you, Mr Charles, and it must be said here and now.'

'Can it not wait, John, until—— A day or two cannot make much difference.'

'A day or two!' said John Sax, and looked searchingly at the frank, sad face. And then he looked across at the bed. 'A single day has made all the difference there! But for you, Mr Charles—Sir Charles, I should say—ay, and for him, I wish to God I were in his place!'

'Why, John?' said Charles, with a look as intent as his own, but charged only with wonder and a touch of doubt. 'What is it?'

'You will remember his last words as long as you live?'

'Surely.'

'You think my head is touched. If the loss of it would right matters how gladly I would lose it! I will tell you what killed him. It will probably kill me—one way or another. It helped to kill Sir George. It may kill you. But his last word was that you would succeed, and dying men see far. Let us sit—here, in the window, Sir Charles. I am going to wring your heart, perhaps to break it; but you will see that I have no choice.'

He dropped into a chair, and set his elbows on the table and his head in his hands, so that Charles could see but little of his face. But what he could see was the colour of parchment and twisted like a withered leaf, and his voice was as dull as the voice of a man whose heart was dead within him.

'For four years and more,' said the dull voice doggedly, 'Sir George and I have been living with our heads in the noose.' And Charles's heart lost a beat and then plunged furiously; and his face went quite white, went crimson, and slowly paled again. 'Four years ago, when the Newcastle banks failed, we ought to have stopped payment. It would have meant ruin to very many, but there would have been no dishonour. Now, if we stop, I go to the gallows. I thank God he has escaped!'

'John!—John Sax! what is this you are telling me?' broke from Charles Lauriston's white lips, and he gripped the table in a vice-like grip to keep the world from falling away from him completely.

'Just the truth,' said the dull, mechanical voice that was so unlike John Sax's voice; 'just the bitter truth. He carried a brave face to the world, but it wore his life out inside. Then something gave way of a sudden, and he is gone.'

Charles sat for the space of some moments in a stillness that was more awful than the stillness of the quiet figure on the bed. For that spelled peace and an end of earthly troubles; and this was the deathly stillness that precedes the storm.

At first he had thought John Sax's brain had gone wrong, but now—— 'How has it been done?' he asked at last, and his own voice was strange to him now.

'Sir George had faith in his power to win through if only we could gain time. And at times we did win, but these have been difficult years, as you know. We have used our clients' funds—and securities.' It came out with a ghastly jerk, that word that plumbed the lowest depth of financial crime. Charles comprehended, if but dimly as yet, all that it implied. 'And as occasion required we replaced them and used others. Fortunately—unfortunately—God knows—we hold very large sums in trust from France. So far they have not been called for. If they were'——

The sweetness of the spring smiled in upon them from the ordered beauty of the Queen's Gardens over the way. The trim lawns were sprinkled with diamonds, the trees and shrubberies gleamed living emerald, the ponds laughed up at the sun, and the thrushes and blackbirds fluted faith and hope.

These things had always appealed to Charles. But never again would they be to him as they had been. Never again would anything in life be to him as it had been. As the condemned may thrill to the short joys of life with keener taste than those whose days may, for aught they know, run to common bounds, so might he seize each permitted day and thank God for it. But that is not the joy of life. The sword that hangs by a thread may add keen edge to appetite, but it does not make for joy.

'John Sax! John Sax! you make me wish I had died at Dunkirk!'

'Many 's the day I have wished I had never been born. But that does no good. We are here face

to face with it, and here and now you have got to decide what you will do. To-morrow—to-day—the fight begins again.'

Now the matter bit home. He, Charles Lauriston, had to decide, then and there, that mighty issue, and with little time for thought.

'To-morrow,' said John Sax grimly, 'we must have funds or close the doors. If he had been alive we should have provided them—he and I together here—as we have done before.'

'My God! My God!' groaned Charles, with his head dropped in his hands.

'You stand clear as yet,' continued the dull, level voice that was so terribly unlike John Sax's. 'You have the right, and the power, to end the matter here.'

And a dreadful silence hung upon them for many minutes.

Then Charles lifted up his haggard face. 'Tell me in full, John, all that it means—right to the end—everything!'

'If you pull up now, it means ruin for very many—hundreds—thousands maybe; utter, absolute ruin, and no possibility of ever making it good. I say nothing of your future or my own, or of your wife and children, and Miss Lauriston.'

'Everything gone?'

'Everything gone, many times over!'

'What do you suppose the total?'

'Not far short of a million. We are close on fifty thousand pounds better than we were last year. In going on there is the chance of redemption.'

'Through certain dishonour,' said Charles through his teeth.

'Through certain dishonour, and every chance, if we fail, of a dishonoured death,' said John Sax inflexibly.

'Death is nothing,' said Charles gravely. 'Dishonour is much—everything. What are the chances of redemption?'

'Better, I believe, than they were, but only chances after all. France must settle down again soon, and that will increase the chances tenfold everywhere. Every country in Europe will want help to start afresh.'

'Our clients there will call for their money.'

'Many of them are probably past the need of it,' said John Sax. 'If they claimed it we should have to find it.'

'And you say, John, in solemn conviction, that you believe redemption possible in time?'

'I believe it possible, because all things are possible. He believed it certain. His last words were to that end.'

'There is no other way?'

'There is no other way.'

And Charles Lauriston dropped his head into his hands again and fell to keen and bitter consideration of the matter.

*(To be continued.)*

---

# THE ROMANCE OF MOVING PICTURES.

By Fred. A. Talbot.

THERE was never an invention but has possessed its individual romance, and no inventor has yet been born who has not experienced many ups and downs and passed through many vicissitudes of fortune in the perfection of his pet idea. As a matter of fact, the greater majority, by the time they have perfected the fruit of their inventive faculty, have found themselves ruined, and have absolutely failed to profit from their labours. This has been shown from time to time in connection with all the great discoveries in our complex social and industrial life. But probably the most powerful latter-day illustration of this fickleness of fortune is recorded in connection with animated photography, to-day the most popular form of amusement in the five continents, which brings before us the life and movement of remote countries, from the bleak, frigid expanses of snow at the Poles to the portrayal of the life, habits, and movements of the most minute members of the world of life which are invisible to the naked eye.

In the year 1885 the Photographic Society was holding one of its usual meetings, and the members were discussing the latest improvements in photography. Upon the table stood a small lantern which externally appeared in nowise different from the ordinary magic-lantern. The only divergence was that, instead of the slides being mounted in a rectangular wooden carrier, there was a glass disc. When held up to the light, this disc was found to be covered, apparently in a promiscuous manner, with a number of transparent pictures; but closer investigation showed that they were arranged in sequence in the form of a continuous ring.

The lights were lowered and the lantern focussed upon the opaque screen which hung in its usual place. The first picture was brought into projection, and the select audience saw that it differed in no particular from the ordinary lantern-picture. Then came the great surprise. Successive pictures were projected so rapidly that those present saw real life, with every phase of motion, pass before them. Every detail was perfect; no action was lost. It lasted but a few seconds, and the sheet was white once more. For a short time the silence that prevailed could be felt. Every one present had seen something that had never been seen before—instantaneous pictures taken so rapidly in succession from one point of view that, when thrown upon the screen at the same

speed, faithfully reproduced the animation of the actual scene.

When the surprise was mastered, the young inventor, who was calmly detaching the plate from the lantern, was overwhelmed with inquiries. One and all wanted to know how it was done. Surrendering to the importunity of his friends, he was soon deeply immersed in a detailed explanation of the camera, its special design and operation to bring about the requisite results, and how the pictures were obtained merely by turning the handle of the machine as if it were a coffee-mill. The popular appreciation 'Remarkable!' but faintly explains the comment of those who were privileged to see the task performed and learnt the simple manner in which it was done.

The young inventor was Mr William Friese-Greene, who at that time was one of the most successful fashionable photographers in the West End of London. That night recorded a new era in photography, and saw the first public demonstration of the results of several years' patience and work in an absolutely new field and in the face of great odds, for in the late 'seventies photographic science had not made the great strides that attended its development in the following decade, and in which he himself played a prominent part, for he made the first celluloid film and discovered the hydroquinone developers.

Many of our greatest inventions have sprung from an insignificant beginning, a passing thought, or the observance of a trifling detail of action. It was the same in connection with kinematography. The inventor was one night using a magic-lantern, and was about to insert one of those slides which provoke such mirth among the young. It was one in which the first picture portrayed a face placid in sleep, while the second showed the annoyance and widely opened eyes with the humorous facial contortions provoked by sudden awakening. While moving this to and fro with one eye shut he observed that when the operation was effected at a certain speed a life-like action was obtained, and this curious feature set him thinking hard.

In the course of a day or so he set to work to devise a means of taking a series of successive pictures on glass from one point of view in a spiral. This was no easy task, as the wet process was still in vogue and the speeds of the emulsions were not what they are to-day. This meant that the inventor had to carry out his own investigations with emulsions in order to get them more rapid than were the plates in use. It was all work in an entirely virgin field, and some of these investigations proved unduly protracted. Then, again, there was the determination of the speed at which the pictures should be taken, and in this connection the inventor can recount many humorous experiences. One of his first experiments was with a friend in the act of drinking. Instead of portraying the steady, graceful raising of the glass to the lips, the photographic representation displayed it in a series of wild jerks or jumps. In another instance, where a young lady was partaking of dessert, the action was depicted photographically as a sequence of spasmodic efforts, which, when thrown on to the screen, proved more farcical than the crude-colour, comical pictures so dear to our young days.

After his first public demonstration he continued his experiments, and two years later exhibited the apparatus in the window of his photographic studio in Piccadilly, 'never anticipating,' he related to the writer, 'the effect it would produce. I thought it might arouse curiosity as a "scientific toy," as it had been described by one sceptical scientist; but I did not look for a riot! Such was what practically happened. The window was besieged by pedestrians, and they packed in a tight mass around the window, blocking the roadway and seriously impeding traffic, and in London's busiest and most fashionable thoroughfare! The pictures I had innocently set working in the window were simply of the Marble Arch on an ordinary day, and if the sightseers had only passed the spot they would not have thought for a moment to stop and watch what I had photographed. But the fact that I had brought that scene to a Piccadilly shop-window, and there reproduced it with all its life and movement, proved irresistible—so much so, in fact, that the police came to me and courteously proposed that I should remove the apparatus from the window, as the traffic was becoming blocked. Not wishing to create trouble, I removed the cause of such curiosity.'

Once more the crude apparatus disappeared from the public eye, though from time to time it was brought out for the edification of learned societies. But the glass plates proved the most serious handicap. Not only were they liable to become broken, but they were bulky and heavy, and could not be made large enough to carry a sufficient number of pictures; since the inventor discovered, as a result of his experiments, that photographing and projecting must be effected at sixteen pictures per second—nine hundred and sixty per minute. Accordingly he set to work upon a new field of research—a substitute for the glass plate. This was a more elusive quest than that of the right speed at which to project the picture to give the desired smoothness and fidelity of movement. He prepared hundreds of different kinds of material in gelatine and other flexible substances that might suit the purpose, but one and all proved impracticable. Then he suddenly bethought himself of celluloid, which was then just coming into extensive vogue. He prepared the substance, rolled it out in thin sheets upon a slab of glass, and cut it into strips about four inches in width, for the early kinematograph pictures were made about the size of the ordinary lantern-plate.

At last success was achieved. Not only had he discovered a medium, flexible, durable, and capable of being packed in small space, which by his crude

method could be made into long lengths of any desired limit, but he had evolved the means of feeding it into the camera and securing the intermittent motion, whereby a succeeding section of film is jerked suddenly into position behind the lens in the minute fraction of a second in which the shutter is closed. In connection with the preparation of this film he relates a very interesting anecdote. He was showing an American the apparatus in his laboratory, and in due course produced a length of the celluloid film he had devised. The American was greatly interested, so much so that he asked if he could take a short length away with him as a memento of his visit and to show his friends at home. With that the visitor departed, and nothing more was seen or heard of him.

'About two years later I met the same American in England. He had forgotten me, and I did not reveal my identity. In the course of our conversation upon photography he suddenly enlightened me of an important development that had been effected in American photographic circles. I expressed my interest. "Yes," he went on, "it is the most wonderful invention that has been made since Daguerre harnessed the latent image. We have been able to do away with glass, and can now use celluloid made in strips and cut to size for our negatives." I extended my congratulations, for I had been engaged in the same field for years past; and my success, though suitable for my purposes, was not commercially exploited. "Is it possible for me to get some of the material? I want some myself for certain experiments." "Why, for sure; I am interested in the matter myself, and I have a sample here." With that he whipped a small packet from his pocket, and with much ceremony unrolled the section of film strip. I took it and examined it carefully. "So this is a bit you have made?" I interrogated as I held it up to the light. He nodded. I rolled the film up and returned it to him without any comment. It was the same piece that I had given him two years before, and which I had made myself!'

When the inventor had perfected his film and had secured a long picture, arrangements were made with one of the learned societies for a lecture upon the subject. In the course of this lecture he described the possibility of taking an illimitable series of pictures in succession upon a long film. In the discussion which followed he was roundly assailed for his statements, and the possibility of taking pictures in the manner he described was ridiculed and regarded as equal to Jules Verne's imaginings. Called upon to reply at the end of the discussion, the young inventor prefaced his remarks by saying that he did not intend to enter into academic arguments with the worthies who had discussed his paper, but would prove his statements right away; saying which, he caught hold of one end of a roll of film he had in his pocket and threw the other among his audience as if it were a coil of paper from a news tape-machine. There was no further discussion.

When the perfect machine was exhibited at the Photographic Jubilee at the Crystal Palace in 1889 it created tremendous excitement, especially the long length of celluloid film. The press described it in a characteristic, sensational manner; but for once their picturesque predictions of the possibilities of a new invention were shortly afterwards more than fulfilled, as is evidenced to-day.

But the romance has its seamy side. First demonstrated, as the idea was, when the inventor was at the head of a flourishing and prosperous photographic portraiture business in the West End, its perplexities and difficulties were such that he became absolutely absorbed in the perfection of it, to the detriment of his commercial interests. The investigations also proved exceedingly expensive, and in the course of eight years sixteen thousand pounds was expended upon it. The inevitable catastrophe happened, as it always does when business is left to its own devices. The cameras and lanterns were seized by the creditors and put up for auction. With a quiet philosophy the inventor recounted his experiences of the subsequent sale:

'I attended the function and watched the proceedings with, as you may imagine, somewhat glum feelings. The lantern which I so highly prized, upon which I had spent four days and nights to secure perfect adjustment, and which cost me one hundred and sixty pounds (for it had to be specially built), was knocked down for a few shillings. The cameras and some other appliances I succeeded in retrieving at a small outlay. But the most mortifying spectacle was the way in which the instruments were handled by their new purchaser. I had tended them with extreme care, for fear of throwing some delicate part of the mechanism out of gear; but the new owner, not having the remotest idea of their real use, unceremoniously threw them into a sack; and when I, out of curiosity, ventured to ask what he was going to do with his purchase, he replied, "Sell it for old gun-metal."'

In the early 'nineties Edison's kinetoscope appeared on the scene and created a furor, though the self-same thing had been before the public here for some years previously. The American Wizard is popularly considered to be the inventor of the kinematograph; but perusal of the records of our own or any other country's Patent Office will show that he was forestalled by Friese-Greene not by days but by years. Each country, in view of the amazing popularity of the moving pictures, even excelling that of the phonograph, is jealous of its own native investigator in this field. Thus America clings to Edison, France to Marey, Germany to some one else, and so on; but in this country, at the Photographic Convention held at Hereford in July 1907, the president, in referring to kinematography, stated that absolutely the first moving-pictures demonstration was given by the inventor, William Friese-Greene, at Chester in 1890. Though demonstrations of the method had been given in previous years, that in 1890 was the first as it is practised to-day with the celluloid

film, and fundamentally the apparatuses now used are precisely the same as those used by Friese-Greene in the late 'nineties. At this remote date the inventor is coming into his own. Other nations have realised that their champions were but following in the footsteps of an English inventor, and can advance no claim disputing the latter's distinction as the Father of Kinematography.

# NAVIGATING THE CAÑON OF THE COLORADO.

By Day Allen Willey.

HE quest for riches has led men to risk their lives in many hazardous feats; but it has remained for two reckless Americans to perform an exploit which few would think of attempting, because of the hardship and danger incurred. To seek gold in that great gap in the earth known as the Cañon of the Colorado River is to defy death itself, for this strange water-course has cut into the world to the depth of thousands of feet in its passage through the American desert. For hundreds of miles it passes through a region so barren that it is unfit for habitation, so that any one who goes into it must take with him an ample supply of food and water if he would come out alive. Should he succeed in climbing down the sides of the cañon, he comes to a turbid torrent rushing along with the force of Niagara, for in many places the rapids of the Colorado are so long and their fall so great that they exceed the famous whirlpools of Niagara in size.

Men have gone through this enormous crevice in the earth; but not until the gold-hunters dared to do it has a boat floated the entire length of the gorges. Major Powell, one of the pioneer adventurers, tried to go through with four boats and eight men; but only by taking a boat around the rapids did he succeed, after three of his little fleet had been wrecked. That was forty years ago. Since then four other parties have defied the mighty river, but only one of them has navigated the cañon for its entire length: the fortune-hunters who took their lives in their hands in search of gold, and made a voyage of seven hundred and fifty-two miles, perhaps the most perilous ever attempted by men.

The Cañon of the Colorado is really a series of cañons. From the place where its largest tributary, the Green River, flows into it, to far-away California, where its waters issue from their rock-wall and flow out over the Yuma desert, the great river passes through no less than five clefts in the earth's surface. Their walls rise from the foaming, swirling waters to heights ranging from three thousand to six thousand feet. The Grand Cañon, which is the name sometimes improperly given to all of them, deserves its title, for it is two hundred and seventeen miles long. The Marble Cañon, so called because much of its walls are composed of marble, borders the river for sixty-six miles. Dante might well have located his Inferno here, for the river is lined with towering cliffs for a distance of four hundred miles, in many places the rock-walls rising more than a thousand feet almost vertically, their surfaces so steep that not even a mountain-goat could get a foothold, and it would be impossible to find even a ledge where a boat could land.

Russell and Monett, and another miner named Loper, were the adventurers. They arranged for their trip by securing steel boats, one for each. The boats were sixteen feet long, and decked over (except in the centre) with sheets of steel fastened by means of a row of small bolts along the gunwale. These covers, or decks, reached from each end to two partitions placed near the centre of the boats, thus leaving only an open compartment three and a half feet long for the passenger. The whole of the food was placed under cover, and lashed securely to prevent shifting. The boats were also provided with airtight compartments at each end and under the seat, containing sufficient air to float both boat and load should all the other compartments be full of water. They named their boats the *Arizona*, *Utah*, and *Nevada*.

The start was made at a little town on the Green River, in the state of Utah. Four days later the trio had reached the beginning of the Colorado, having covered the one hundred and twenty miles in less than five days. From this point to Hite, a small town in south-east Utah, the first rapids were encountered in the forty-one miles of Cataract Cañon. Here Loper's boat met with disaster in the rough water, dashing on a rock in the midst of one of the rapids and rending its side.

They managed to reach Hite, where Loper decided to give up on account of his wrecked boat, and Russell and Monett were left to continue. Friday, the 13th of the month, had no terrors for the intrepid pair, and they started off down the river on the morning of that day, with the Marble Cañon acting as an introduction to the Grand Cañon below. In seven days they passed down the roaring torrent, with the perpendicular walls of Marble Cañon towering up on either side to an average height of three thousand feet, and came through safely, although their experience was indeed thrilling, for in one part of the cañon there were fifty-seven rapids in a series, some of which have falls of from sixteen to twenty feet.

Entering the Grand Cañon, for the first fifteen miles below the entrance of the Little Colorado and the beginning of the big cañon they found the water comparatively quiet; but from this point on their way was threatened by the most dangerous falls

they had met thus far. The good-luck which had attended them from the start, however, still continued, and they managed to force their way, without damage to either boat, down over the almost continuous cataracts for five long days.

Christmas Day of 1907 found Russell and Monett huddled over a fire of driftwood on a strip of sand just wide enough to beach their boats. They were in the heart of the Grand Cañon, hemmed in on every side by cliffs of black granite. Coming through miles and miles of rapids, the river, as far as they could see below them, was covered with breakers, from which the spray dashed high. To remain where they were meant starvation, so they again launched their craft. Immediately below this camping-place, and continuing for the succeeding ten miles, the river dashes through a stretch of water, the most perilous section of which is known as the Sockdologer Rapid. To make matters worse, Russell found it impossible to follow his usual custom of 'picking a trail' through these rapids. When possible, he would climb along the precipitous sides of the cañon beside each cataract, leaving Monett above the rough water in charge of the two boats. From this point Russell could pick out the most dangerous places through the rapids, and 'chart' a course accordingly. But in these ten miles the granite walls are sheer and smooth for over a thousand feet of their rise upwards. Russell could find no foothold, and the men faced the necessity of 'shooting' unknown waters.

As always, Russell led the way in his boat, swinging it into the boiling current stern first—his own method of taking each cataract—and making his frail craft respond to his will when possible by a forward pull on one or the other of his oars. After the first minute the cockpit in which each man sat, and which was shut off from the rest of the boat by watertight compartments, was filled to the gunwale with icy water, in which the oarsmen were soaked. Hundreds of times waves totally submerged them, the little boats staggering out from under the terrific weight of the water only to plunge into another broken wave.

Russell heard his companion cry out in terror from behind. Before he could turn to see the cause of the cry he was driven into smooth water. Mooring his boat at the foot of the rapids as quickly as possible, he half-climbed, half-waded along the shore of the river, and made his way back. Monett, with his boat wedged tightly between two jagged rocks, a foot below the sweeping water, was hanging desperately to the side of the little craft, his body straightened out horizontally by the rush of the water about him. The boat was completely wrecked. But when Russell threw the rope to his companion he was astounded to see him carefully work his way closer to the boat, and begin to tie its contents securely to the one means of saving his own life. Against the roar of the rapids it was useless for Russell to yell to his comrade to let the food go and save himself. Four times Monett let Russell haul sides of bacon and sacks of beans through the thirty feet of rushing waters between him and the shore before he finally caught the rope himself and allowed Russell to drag him to safety. He had been in the water more than twenty minutes, and was nearly exhausted when Russell helped him to his feet.

This accident left but one boat available, and as it was decked over with the exception of an opening just large enough for one man, it seemed as if Russell would have to continue alone. But a novel idea occurred to him to carry his comrade on the covered deck of the remaining craft. This was finally decided upon, and the trip resumed. They succeeded in reaching another stretch of smooth water at the foot of what is known as Bright Angel trail, one of the few pathways from the rim to the bottom of the cañon. Here, while a trail-party of tourists were eating their luncheon on the river-shore, they saw two men in a little row-boat swing out of the rapids two hundred yards up the river and row leisurely towards them. In the thirty years that tourists have visited the bottom of the cañon at this point it is safe to assert that not one ever saw a sight like this.

This was the only time Monett and Russell came out of this under-world during the four months they remained in the cañons. They stayed three days at a tourist-house on the rim; then, descending, resumed their voyage, one man being carried on the boat-deck. Although another series of dangerous rapids were encountered below Bright Angel, they managed to get through without a wreck, and finally ended their journey at the little town of Needles in California, one hundred and twenty days after leaving the shores of Green River.

The way in which they performed the seemingly impossible feat of navigating this great mountain-torrent is well explained in Russell's account of their experiences in some of the cañons. Speaking of the Cataract Cañon, he says:

'The rapids presented a terrifying appearance, the rushing, roaring water, beaten into foam as it plunged over the rocks, rolling in waves five to ten feet high at the foot, stretching away into a tail of vicious, white-capped waves for one hundred yards and more before they became quieter, and ended in swirling whirlpools. Hardly does the water quiet down until it takes another plunge, so close are the rapids together.

'It was to be my first experience in shooting rapids. I rowed out, taking the centre or tongue of the current. I seemed to go very slowly until very near the brink, when my speed was suddenly accelerated, and over I plunged, the boat taking a stiff angle downward as she went over, only to rise abruptly as she climbed the next one; then another pitch downward for the next, but this she did not climb. This wave combed back fiercely, and the rear-end of the boat plunged under. The huge wave deluged the boat, almost taking my breath away as it swept clear across the boat; but she rode

nicely, and was out on top of the next one easily, and we were soon through the worst part, and pulled into the eddy.

'Our method of running rapids was exactly the opposite of that of most boatmen. We shot in stern first—that is, with the stern down-stream; thus the oarsman is facing his course. When a rock is to be missed, the oarsman simply turns his bow away from it and pulls up-stream; and the current, now travelling much faster than the boat, whips it quickly away from the rock or obstruction. In this manner a boat can be guided back and forth across current, going much slower than the water itself, and rocks can be easily dodged.'

# THE MANTLE OF ELIJAH.

By J. Morton Lewis, Author of *Senorita Dolores*, &c.

It was in the eighties when our regiment was serving in one of those frontier wars on which so much often depends, perhaps the peace of Europe, and to which is devoted a brief paragraph in the English newspapers.

I was second in command of a small punitive force sent against Rhandda Khan, an Afghan, who, with a few hundred followers, had made a series of raids upon the native population of the smaller villages scattered around Peshawur.

In response to urgent requests from those of Her Majesty's subjects who earned a precarious livelihood by cultivating a few acres of rice-fields, we had been despatched from Lahore, where we were garrisoned, with instructions to ride night and day to the seat of the disturbance.

It was early morning, and the first rays of a July sun were breaking over the hills, when our little force entered the streets of Peshawur.

Tired and thirsty, we dismounted and flung ourselves upon the grass by the roadside to snatch a few hours' rest before we commenced our task of subduing Rhandda Khan.

Reveille sounded before we had recovered from our previous night's march, and two hundred and sixty very weary men of the line gathered in the horses and gave them their morning meal.

An hour later Colonel Cullingford interviewed the chief natives whose property had been ravaged by the rebel. It was a mournful tale they told. Rhandda Khan apparently had pitched his camp among the hills, where, at the head of nearly a thousand followers, he made periodical swoops upon the country-side, robbing the inhabitants of their wealth—little enough, Heaven knows!—devastating their property, and in some cases even carrying off their women-folk.

'But now that the war sahib has come, we are safe,' said one.

Colonel Cullingford enwrapped them in the protecting folds of the British flag, assuring them that with the advent of the White Queen's troops all danger for them was past.

When the last of them had departed, he returned to me with a new-born seriousness on his face. 'We are in for an awful job,' he said. 'Our force ought to have been treble what it is. I only wish Colonel Cusack were alive and with us now;' and he walked away to issue some orders.

Colonel Cusack was the late commander of our regiment, who had died only a few months before from a sudden attack of malaria. A soldier beloved by his men, as he was, who knew his India as well as a Cockney knows the Strand, his name was known throughout the country—known and feared.

That night we rode out of Peshawur and camped among the hills, taking with us a couple of natives to act as guides.

The Colonel and I shared the only tent that had been brought with us, and before we turned in he stood at the entrance, framed out in dark relief against the pale moonlight. Around us stretched the gray slopes of the hills, in some fastness of which we knew the man we had come to seek lay hidden. There is nothing so awesome as the hills on the North-West frontier. Their silence is oppressive; it warns one of the hidden dangers that may lurk in their passes, almost of treachery. They are beautiful, but it is a cruel beauty. The remembrance of their slopes lingers in one's mind, ineffaceable, but with no pleasant memory. I have known men, brave men, who shuddered at the thought of them; men who have known them in peace, and have not heard the rattle of musketry, the fierce cries of the Afghans upon their sides.

For a few moments the Colonel stood there in silence; then he called me to his side.

'Look at it,' he said.

Around us on every side they stretched, the key to India, the passes by which no adversary could invade the land. Gray, tapering to an almost ashen colour, they lay on every side, magnificent, yet cruel.

The Colonel laid his hand almost affectionately on my arm, and there was a deep yearning in his eyes. 'I would give my soul to be Colonel Cusack for the next few weeks.'

With that he retired into the tent.

For a few moments I stood gazing at the view around; then I joined him.

He was stretched full length upon a rug, his service jacket utilised as a pillow.

'I shouldn't care to undress in a place like this,' he said.

For a week we spent our time chasing an imaginary foe among the hills.

Then one morning a patrol of sixteen men was surprised and cut to pieces in a narrow defile. We came upon them sword in hand, as they had fallen.

As we stood beside their bodies, a mere handful of men ourselves, we knew Rhandda Khan had issued his challenge, and more than one looked at the dark-gray hills around, wondering if they hid anything. It is this that makes a year among the hills more exacting and injurious to a man than a decade on the plains—the terrible, silent uncertainty, the awful waiting for surprises long delayed.

I was standing by the Colonel's side; he was without a helmet, and a soft, warm wind was playing amidst his iron-gray hair.

'The fight has commenced.' For a moment he appeared to hesitate; then he looked up into my face. 'I am going to act as Cusack would have done had he been alive. I have been dreaming of him every night since we came to the hills—dreaming whilst I was awake. I have seen him standing in the door of the tent each night, and have spoken to him.'

I looked closely at him, fearing that the sudden responsibility and the silence of the hills had acted upon his mind. They have done so on other men's brains before now.

He saw my glance and interpreted it. 'I am quite sane,' he said with a grave smile.

We carried the bodies back on some improvised stretchers, and buried them at the foot of the hills. The next day there came to us news of an attack Rhandda Khan had made upon some villages.

'Foster,' said the Colonel to me when he heard of it, 'I am going to leave you in charge of the camp with fifty men. The others I shall take with me. I may be absent a couple of days, but I shall heliograph every few hours.

Three hours later I saw the small force canter across the plateau on which we were encamped and pass out of view down a narrow defile.

At sunset the first message was flashed to us: 'Hope all well. Shall be back to-morrow.'

At ten o'clock next morning another message came: 'Am ten miles north-east. Strike camp and join me instantly.'

Within an hour I led my small force along the pass, through the unknown dangers, to join Colonel Cullingford. We had not travelled a couple of miles before the heliograph was at work: 'Am coming to meet you. Throw out scouts and be very careful.'

There was an ominous reticence about the message very far from reassuring, which made me study the hills around me very closely with my glasses. There was no doubt that the Colonel had discovered the position of Rhandda Khan, and that he lay somewhere between our two forces.

Acting on his instructions, I sent four men ahead to act as scouts.

They had hardly left us before another message came: 'Push forward with all possible speed.' And almost instantaneously, from another position a little farther east, we discerned the heliograph working to the point from which our message had come.

Instantly I issued the order to my men, and closing up the ranks, we galloped in the direction the Colonel had indicated. It was an exciting hour, one never to be forgotten. To an uncertain destination, through unknown dangers, expecting every moment to come face to face with the army of the man we were seeking, or to hear the sound of firing which should denote his presence, we sped between the hills.

Suddenly there came to our ears the rattle of rifle-shots, the pass through which we were riding widened out on the horizon, and through my glasses I could see a grand plateau in the distance.

Ten minutes, and the whole scene was laid before our eyes—a battle scene in miniature, fraught with the horrors of death.

Colonel Cullingford had found Rhandda Khan, and was engaging him with a force of less than a hundred men.

Barely a mile separated us, and with a wild hurrah, their swords drawn, ready to thrust, my men galloped across the plateau.

Riding out of another defile to the east of us came the remainder of our force, another sixty men.

After I had ordered my troop into one long line, stretching to meet the company, we tore across the open ground, the light of battle in the men's eyes, the horses' hoofs thundering upon the sun-baked ground.

The Afghans saw us, made one last attempt to regain freedom through the Colonel's force, then broke and fled in all directions.

To meet them we spread out in a long crescent formation, closing in upon them. Many threw down their arms, to be trampled beneath the feet of our horses, while others were impaled upon our swords.

In ten minutes all was over, and the ground white with the figures of those who had fallen.

In the midst of it all I found the Colonel, hot and dirty, by the side of the body of Rhandda Khan.

'Ah, Foster,' he said, 'you did your part splendidly—splendidly.'

That was all then.

It was in the cool of the evening that he told me the story—how he had discovered the position of the enemy from information which he had received from a native, information which he had verified by going to Rhandda Khan's lines alone at dead of night.

'You went to their lines alone?' I said incredulously.

He nodded. 'Yes; it is what Cusack would have done.' He leant towards me. 'I wonder if there are such things as spirits. If so, as sure as there's a

God in heaven, his has come to me. I dreamed what I was to do three nights ago, that night upon the hills when it was so hot that you slept outside the tent, do you remember? Dreamed every word of it, and I was as much awake as you are now. I saw the old Colonel standing in the entrance to the tent, between you and me—saw him as plainly as I see you now. What do you make of it?'

I did not answer. There was nothing to be said.

'At any rate, spirits or not,' he went on, 'I have done my duty.'

'Yes,' I said, 'the mantle of Elijah has fallen upon you.'

## THE SALMON-FISHERIES OF BRITISH COLUMBIA.

EXT to the gold and silver deposits, nothing has contributed more to the fame and prosperity of British Columbia than the salmon fishing and canning industry. Almost everybody has read of, if not eaten, British Columbia salmon; but the individual consumer of the king of fish—offered canned and ready cooked in all quarters of the globe—has little or no conception of the general features of the industry, the enormous capital involved, or the extensive work done locally to keep pace with the ever-increasing demand.

An idea of the remarkable development of the industry may be gathered from the fact that when the fishery-laws of Canada were first made applicable to British Columbia, in 1876, the total number of establishments for canning purposes in the province, all on the Fraser River, amounted to four! Thirty years later there were no less than sixty-six canneries in operation, besides oil-factories, cold-storage works, and salteries.

These canneries, &c., are equipped with machinery of the most approved type for dealing promptly and cheaply with the vast salmon-harvest of the Columbian rivers; and, including fishermen and general workers, there are about nineteen thousand people engaged in the business. As many as one million two hundred and fifty thousand cases (each containing from four to eight dozen tins) have been packed in this district during a single season lasting only six weeks; while the record 'pack' on the Pacific reached in 1901 the mammoth total of five million cases!

There are six varieties of the salmon—namely, spring, sockeye, cohoe, steelhead, dog-salmon, and humpback. All these, however, do not inhabit the same waters. Except in Minkish River and certain adjacent creeks, the eastern shore of Vancouver Island is devoid of sockeye; but an excessive and continued 'run' is experienced on the west coast. Humpbacks are plentiful in the Chemainus River, the Howe Sound, and Burrard Inlet; but they are never found in the Cowichan. The spring is a frequenter only of the main rivers; but the cohoe and dog-salmon find their way into every little creek or pool.

The time of the 'run' of the same species in different waters varies considerably. Generally speaking, however, the spring fish appear in the spring and autumn, the sockeye in the summer months, and in the autumn the cohoe, steelhead, and dog-salmon are strongly in evidence.

The best table-fish are the spring, cohoe, and steelhead. Of the former there are two kinds, pink and white, and in weight they are found up to eighty pounds in British Columbia waters, and in Alaska (where they are known as the king-salmon) they have been caught up to and above one hundred pounds in weight. The sockeye, however, is the fish of most commercial value, and this is the variety that is used by the canners. Only when a short 'run' of sockeye has been experienced are cohoes packed; and the Indians alone have use for the dog-salmon and humpback, but a greater utility is assured these two kinds with an increased demand for fish-guano and fertilisers.

Fishing operations are carried on at different points of the coast, notably on the Fraser, Skeena, and Naas Rivers, and Rivers Inlet. The main watercourse of the province is the Fraser River. It has its source in the Rockies, and is about seven hundred and fifty miles in length. It is navigable for upwards of one hundred miles to New Westminster, and excellent accommodation in deep water is found for large steamers and sailing-vessels about twelve miles from the mouth.

Steveston is the headquarters of the fish-canning industry on the Fraser, and the striking progress and development which it has witnessed during the last twenty years or so speak volumes for the enterprise and ability of those engaged in the business. Considerable attention is now directed to the cold-storage plants of the province, and large quantities of salmon are sent away 'fresh' in ice to the towns and cities of Canada and America, and even to Europe, in refrigerated cars and steamers.

It is fully twenty years since salmon in a frozen state were first shipped from British Columbia to New York and London. In the former case the venture was a complete success, but the same cannot be said regarding the material despatched to London. The shipments to this country were generally made *viâ* Sydney, a total distance of twenty-two thousand miles, and the handling of the fish during transhipment left much to be desired as to quality on arrival. Obviously something had to be done; and a year or two later a new departure was made, when a parcel of one hundred tons was consigned by a steamer fitted

with cold chambers direct to London and Liverpool, *viâ* the Magellan Strait. The results were eminently satisfactory, and further developments rapidly ensued in the same direction.

In the transhipment operations the steamer's plant alone is utilised. Moored alongside the cannery, a large-sized scow is in attendance upon the steamer. The greatest care is exercised so that fish of the best quality may be procured. Three kinds are shipped: cohoes, spring, and steelheads, the former being in much the larger proportion. Taken fresh from the boats of the fishermen, the finest specimens of fish are selected, and all those with unsightly markings or showing the imprint of the gill-net are at once rejected. Fish-cleaning operations on the scow provide work for a large staff, each fish being cleaned separately, the bodies being thoroughly scrubbed, and particular attention paid to the head and gills, and all blood and slime removed. A final plunge in clean, fresh water precedes their elevation to racks round the scow, where, by a cord attachment on the tail, they are hung to drain. Each fish is well dried, wrapped carefully in special white paper, and packed into boxes each containing twenty fish. After being marked, the boxes are put into slings and hoisted on board the vessel. They are placed straight away into the cold chamber, where they remain throughout the voyage, reaching the markets of this country in capital condition—firm and fleshy, of a good colour, and full of flavour.

Prior to the fishing-season, extensive preparations are made among the fishermen and at the canneries in anticipation of the busy time ahead. At the canneries tins and cases by the hundred thousand are got ready, and afterwards months of work are necessary in finishing them off and despatching them.

A cannery of average size owns and works about twenty-five to thirty boats; but with outside contractors the total is increased to from seventy to one hundred. The total fishing-fleet engaged in the salmon-fishing industry is composed of fully five thousand round-bottomed boats and skiffs and about thirty steamers. Considering the large number of people that are dependent for a living upon the lordly salmon, the numerous appliances used for its capture, and the huge takes recorded, it seems incredible that any fish should be left 'to tell the tale.' But no risks are taken in this respect, the establishment of hatcheries by the Canadian and American Governments providing for the liberation of millions of small fish every year.

In the month of June or July shoals of salmon begin to leave the open sea for spawning in the rivers, many hundreds of miles distant; and as soon as they reach within fifty miles of their destination, they enter the danger-zone. Many miles of netting, at a cost of tens of thousands of pounds, have been stretched in the sea, and dozens of traps are ingeniously arranged in order to stop their progress and catch them on a wholesale scale. These traps are made of strong uprights driven firmly into the ground, to which nets having a small mesh are fixed, extending from the water-line to the ground. The lead-net is about fifteen hundred feet long. The salmon strike this, and go straight on till they reach a kind of pocket by a short lead approaching another at right angles. A second double pocket or heart opens from this, and the fish, still advancing, reach the trap proper through a narrow opening. Such a trap will catch from four thousand to twenty thousand fish per day, according to size and situation. Even if the salmon is fortunate enough to negotiate and avoid the traps, there are thousands of fishing-boats working around and blocking the entrance to the river, to make no mention of stake-nets, fishing-wheels, and the spear of the Indian. The fish that do successfully run the gauntlet and eventually reach the spawning-grounds are in poor condition, their bodies being wasted and torn, and covered with slime and festering sores. Few indeed that get so far ever return to the sea again. Of course the fish used in the canneries are all prime fish taken before or immediately on their entrance to the river, and the foregoing only refers to those that escape the snares laid for them and successfully reach their destination.

Occasionally a 'run' is of such vast and extraordinary proportions that, despite the great resources now operating at the many canneries, it is quite impossible to make use of all the fish caught. When this occurs the price of salmon, instead of being from fourpence to sevenpence each, as it generally is at the beginning of the season, drops sometimes as low as three-halfpence to threepence, and in a recent record season scow-loads of trap-fish were actually hawked on the Fraser at one halfpenny per fish!

It is confidently anticipated that the salmon-fisheries of British Columbia will yet develop to an even greater extent than at present, for it is generally admitted that few countries present such a large and profitable field for capital as Canada's maritime province on the Pacific.

## BOGHALL CASTLE.

Here—where the winds blow fresh and free,
And mists on earth are falling,
Where the silent hills encircle me,
And bygone years are calling—
I sit and think of the long ago,
Among the sweet wild heather,
Of the ruined castle far below
Where the lapwings weep together.

In the wimpling burn that hurries by
I cannot trace the story,
And yonder lark which seeks the sky
Sings not of ancient glory.
For thou dost sleep in the moss-clad vale,
By silent stars attended,
Where the low, sad note of the curlew's wail
With the evening calm is blended.

# THE HEART OF THINGS.

By Henry Leach.

*London, Yesterday.*

OH, how one is weary in the big town for the coming of the spring! So long does it seem since one could move away with any pleasure of anticipation into the open country! And the days have been dark, and the labours have been hard, and the sorrows have been keen. When we left the hills and the meadows and the country lanes at the beginning of the autumn days, left the clear sunshine and the sweet scents and music of nature behind us, we plunged into the strong, fast, thundering life of the heart of the world with no little feeling of pleasure, the pleasure of the fight. But it is not in the London way to last the winter well; it is so long and so dreary. The fighting tires, the gloom first comes and then increases, the spirits sink a little, and then the yearning comes for the spring days that give the new hope to weary men and women. The man who lives the round of the year up on the mountain-sides or in a cottage by a stream may himself indeed be glad when March takes its place again in the order of the months, the March which is blamed for its winds, but the month which brings the first flowers and gives the spring. But though there may be few of the natural signs of spring to be seen in the town, only the winds and the warmer rains, and the brightening skies and the light of day which endures until the regular toilers come to leave the streets of the City and descend into the subterranean tubes wherein they make their journeys to their suburban homes, one comes to the view that there is no man who so much welcomes this coming of the spring with all its promise and all its hope as this one does. He feels the strain of the winter-time so much. The passing winter has on the whole, perhaps, been less unkind in the matter of weather and murky fogs than others of recent times have been; but still it has been a season of great strenuousness and mental pain. The conditions of life in their speed and their severity have been harder than before, as they are harder year by year; but more than this, much more, it has been a season throughout of troubles and anxieties. The newspapers, reflecting the moods of the moments, have been gloomy in their tone since the autumn came. One may care little for the newspapers and what they say; one may scarcely ever read them; but the continual dropping of the water wears the rock away, and the nerves weaken under the strain of constant dark prophecies and forebodings. Day by day we have been told that it is to become more difficult to live, that in the near future it will be next to impossible; week by week we have been asked to view a mental picture of a foreign army landed on the shores of England. There have been horrible scenes of starvation and misery in the town, and then the people rejoiced because in their very midst, on the banks of the Thames, a new battleship was to be built. Here surely there was a little complexity of circumstance with a touch of irony interwoven. And in the midst of it all there was the great unsettlement, the really awful derangement of things, the bittering effects of a General Election, the shadow of which hung over the Christmas-time. Let this dying winter soon be gone, with no blessing upon it save for the hours of silent memory of the days of the past which were stolen from it. As after a great war there comes a time of peace when men go back to art and nature and peaceful work and all the beauties of life that are attendant thereon, so after the winter in town there is a great renaissance in the spring-time, seen clear to the eyes of those who can observe it. Men's thoughts turn to other things. Their hopes revive. They feel the blood warming in their veins again. They think that after all it is a good thing to be alive. They have new schemes. Great enterprises are afoot. In the City the prices of stocks and shares show some inclination to improve. A certain brightness comes over everything. It is a pleasant thing again to walk down Cheapside, the Strand, and Piccadilly, and out into the Park, where there are already some

[*All Rights Reserved.*]

pretty flowers to brighten the borders, and the buds on the shrubs and the trees are already swelling with promise of the green leaves which they will shortly give forth. All these things increase the feeling of hope and give a stir to action. Yes, we say, we will go into the country to-morrow, and we will see again the things that we like and love. And all about the edge of the town there is a pathetic thing to be seen happening daily. There are good folks there in their thousands who cannot be going out into the country just as soon as they hear the call of it, or not, indeed, until the hot days of August, far off, come round to them. But they tempt a small morsel of nature towards them, and they fondle it. They have little plots of garden, surrounded by great houses and blocks of flats, and perhaps laid atop of one of those subterranean railways. There are just a few feet of earth, petted and stimulated by chemical means, and here in the early days of March there are crocuses and daffodils to be seen, and the people are outside tending them, digging and raking, making their preparations for their little harvest of flowers that they look forward to the enjoyment of. So there is hope in the dull suburbs, and some pathos in it.

* * *

All the world loves a lover, so it is said. And though this is a very matter-of-fact age—perhaps because it is that—there never was a time when the people cared better to read the love-stories of the most ardent souls of the past. In the open general life of to-day the word 'sentiment' is considered to embrace something of weakness; to say that a man is sentimental is to suggest that he has not a proper grasp of things, certainly that he would not be a success in the City; and to say the same thing of a woman is—well, to convey the idea that at all events she is outside and behind her time, and that there is no place for her in any of the new and great movements that are supposed to be stirring the world. But yet, though these be the views that are expressed in public, it is to the stories that are richest in sentiment that men and women most delight to turn for relief when the cares of the time are heaviest upon them. When the black cloud of a great war hangs over the world, when parties of the State rend each other in a strained conflict upon abstruse questions of taxation, when there is a new story in the morning papers of a woman who has been carried shrieking from some public hall where she had attempted an assault upon a Cabinet Minister, it is a relief to change the thoughts away from this heavy mass of sordid things in which there is no beauty and no kindness and no purity, and let them loose among the heavens and the stars, where there are no laws but those of simple Nature, and where manners and customs are of less account than the simple working of the soul. There are no such romantic tales as those which hang around the literary and poetic geniuses. We have them at home in the lives of such as Byron, Keats, Shelley, and Burns, belonging to what was surely a very romantic age of genius. In France that age came a little later, and, naturally, after the horrors of the Revolution and the peace of spirit that was felt at last after the Napoleonic period was brought to a close. There was a great awakening of genius then, and there was a rich romance in the lives of the men who wrote, just as there was in what they wrote. Chateaubriand was a type. Another was Alfred de Musset, who has to be ranked as one of the great lyrical poets of his country. He was a master, and in some of his work he plumbed the depths of the deepest tragic passion as others have seldom done. And for himself, though poor in some respects, he was a man of the strongest feeling, of the keenest emotion. Some of the episodes of his private life—if that term may be properly employed in such a case—are well known. They give him some likeness to Byron. That there were other events that the people did not come entirely to know was suspected, and only now is the truth disclosed; and not merely the French but other peoples are interested.

* * *

It is a story of the poet's attachment to a lady whose identity was preserved as a close secret until the present time. It is now thirty years since she called on the secretary of Saint-Beuve regarding certain love-letters which she had received from De Musset. She was thinking at that time of destroying them; but this man, Troubat, persuaded her to give them—there were seventy-nine—to the Bibliothèque Nationale, attaching the condition that they were not to be opened until after a fixed date. A period of fifty years was at first suggested, but this was afterwards altered, and the time is now just completed. Of course the lady is long since dead, and it happens that this year is the centenary of the birth of De Musset—almost the only literary centenary worth speaking of in 1910, in such contrast to last year, when there were so many. There is no longer any doubt as to the identity of the lady, upon which point literary Paris has been puzzling itself exceedingly for some time past. She was Mademoiselle Aimée d'Alton, who after the death of Alfred de Musset married his brother Paul; and, as Mademoiselle d'Alton reminded us in the curious little preface which she has given to the letters, there is a reference in the biography of Alfred written by his brother to 'a reciprocated passion between him and a woman in high society of whom he kept a pleasant recollection all his life.' Mademoiselle d'Alton refers to herself throughout as 'Mlle. X.,' and in this preface she says: 'In reading these letters it must not be forgotten that Alfred de Musset and Mlle. X. belonged to a generation that was ardent, passionate, and enthusiastic, which is described by the poet in his introduction to his *Confessions d'un Enfant du Siècle*.' Ideas have changed so much

since then! What once seemed simple has now become something quite incomprehensible. What will it be in 1930 (the date originally fixed for the publication of the letters)? In those days love expressed itself more ardently than now.

* * *

There is not space here to do more than make reference to the beginning of this correspondence, in which there is a strong emotional and literary interest. When De Musset was close on twenty-seven years of age he was leading anything but a placid and steady life, and this lady, whom he had previously met, sent him a purse embroidered by herself as a hint not to throw away his money in gambling-hells. This seems to have been the beginning. 'Yes,' wrote De Musset back to Aimée, 'there is friendship for me in the hand which executed this delicate little piece of work, this precious purse which holds a thought of yours in each of its tiny threads, or at least a look of your eyes. When shall I see you again? When will you come back? Shall I still be there? That is what I am thinking about now! And I beg you, in pity, if this letter seems extravagant, not to answer it, but at least not to make me sorry for having written it. A harsh word from you would hurt me more than the rest has pleased me, for now I know you and I love you, and neither you nor I can help ourselves.' This association came at a critical time in his career. Even the day before he received the purse he had been considering the acceptance of a diplomatic appointment at Madrid which he had coveted for some time. Had there been no Aimée he would have accepted, and French literature might have been something less than it is. But with the love between them suddenly fired to passion, all his thoughts, his whole scheme of life was changed. What the future held for him he did not know and hardly cared; what he felt was that now he could not go to Madrid, to which a week previously he would have gone rejoicing. He could not bear the idea of leaving this new love that had come to him. He was restless, undecided. Aimée answered his letter on the day she received it, and he wrote again without any delay. 'I believe that I love you, child,' he said, 'and I am making no mistake. You say that your health is an insuperable obstacle. I do not know such a thing in love. As for your being "a woman older than I, with a face that is growing more and more grave," let me tell my friend of twenty-five that I am twenty-six, that I believe her heart is very serious, but that her young and charming face is very gay and very rosy; that a lounge-chair is not so bad a piece of furniture as you make out; and that, as far as talents go, you have the best of them all—that of being beautiful; and for wit, just what makes the charm and irresistible attraction of yours is the mixture of merriment and reflection, of vivacity and languor. Child, happiness was made for you if it was made for any one in this world! You know my character, you say. You, in turn, are mistaken. I am twelve months older than you in years, but ten years older in experience.' And then from this point the poet-lover goes on to speak of what his experience—at twenty-seven—had taught him of the progress of life's joys and sorrows in the case of the emotional human being. 'My experience,' he wrote, 'is not very alarming, and let me tell you what it has taught me. To dream beautiful dreams and to wish to realise them is the first and inevitable quality of great hearts. But nevertheless, in entering upon life, reality, with its thousand horrors, sooner or later strikes down the still virgin hope from the heights of its flight. This is not a moralist's phrase, but an eternal truth. The first experience, Aimée, consists in suffering; it consists in discovering and feeling that all absolute dreams hardly ever realise themselves, or that if they do they wither and die in contact with the things of this life. A sentiment of bitter reflection is, then, the result of this first trial. The heart wounded to the core, in its first effort, bleeds, and seems to be torn for ever. But nevertheless we live on, and we must love to go on living. We love in fear and trembling, and by degrees we look round and see that life is not so sad as we thought. We come back to ourselves and to happiness, to God and to truth. The heart, made stronger, accepts difficulties, sorrows, and even horrors; sure of itself, it foresees them, fights against them, and sometimes even changes them into blessings. More resigned, it takes more pleasure out of the happy days, longs for them with greater ardour, prolongs them with more care, and finally comes to say to itself, "The evil is nothing after all, since happiness exists." The name of "friend" pleases you. Child, are friendship and love different words? You say my letter destroys your hopes. Your letter makes me thank God! It opens to me a world of hope, of desire, of torment, without doubt, but of god-like delight. Do not shut out this world, my sweet angel; do not doubt, do not look ahead, but smile, answer, be kind and true as you are beautiful. We feel such strength when we are two! Come, then! Oh, come as fast as you can! You could if you would!' The sorrow of his earlier life at which De Musset hints is without doubt the episode of his association with George Sand, which had happened about four years earlier. The story, as revealed in the later letters, passed through some strange vicissitudes. It was an interesting beginning but a poor end. De Musset had not enough of the man and the hero in him for this sort of thing. He lacked character.

# LAURISTONS.

## CHAPTER XX.—HOW SIR CHARLES PUT HIS HEAD INTO THE NOOSE.

OU and I, of course, would not have given the matter one moment's consideration. That goes without saying.

Here on the one side were Right, and personal safety, and—ruin irretrievable for thousands of innocent victims. For the fall of Lauristons would not only strip its clients to the bone, but would drag to the ground its corresponding houses all over the country, and would offer unscrupulous traders everywhere acceptable opportunity of defrauding their creditors under plea of losses through the failure of the banks. In its consequences and the devastating wideness of its sweep the disaster would be almost without parallel. And on the other side were Wrong—Wrong, inexcusable and indefensible on any grounds whatsoever—the certainty of the gallows if ever the wrong-doing came to light, even though full restitution were within an ace of accomplishment, and the chance, the bare chance, in time, of possibly righting the wrong.

'Right! Safety! Ruin!—Wrong! Gallows! Chance!' The clock on the mantelpiece beat out the changes with dreadful iteration, and the minutes as they passed clamoured insistently for decision. 'Right! Safety! Ruin!—Wrong! Gallows! Chance!'—every dreadful moment that passed brought the issues to a finer point.

In that terrible silence the soft ticking of the clock beat on Charles Lauriston's tight-strung nerves like the strokes of a bludgeon, like the bell of St Sepulchre's which knelled the victim on his journey to the gallows.

A dreadful balance-sheet this for any man's consideration! And how, in the numbing derangement of so sudden a blow, allot the items to their proper places in the account? Debit and credit, profit and loss, were inextricably mixed, tangled, and interwoven beyond the possibility of unravelment. For what would be profitable to himself in the way of personal safety meant loss to every one else concerned. And what might mean—nay, he knew must mean, in very many respects—uttermost loss to himself, even though he had honour in the sight of men and escaped the gallows and died in his bed at last, might mean restitution and safety for the others.

Yes, you and I would undoubtedly have chosen the clean path of honour—and of safety. Right is right, and Wrong is wrong. There is no middle course, and argument in such a matter is sheerest sophistry. We have, you and I, a most wholesome hatred of that most unwholesome Jesuitical doctrine of any means to an end—of wrong permissible so the end be good; a doctrine and a practice that between them have wrought, perhaps, more ill in the world than any conceivable others. Pray God you never fall into so dire and subtle a temptation as this man!

I do not defend him; that were impossible. I do not palliate his offence; that is unnecessary. What he did, he did with his eyes open. He looked down the gloomy ways and saw sorrow and darkness and loneliness as his inseparable companions, and the menacing shadow of the gallows ever above them, and the possibility of the shadow becoming dreadful substance of raw wood and knotted rope at any moment.

He could escape it all with one word. Just an emphatic 'No!' and his father's memory was given over to dishonour, and John Sax to the gallows, and all who had trusted in them to irremediable ruin, including his wife and children, his sister, innumerable friends, and himself. For there would be less than nothing left, and he did not know to what he could turn his hand. His very name would be a byword and reproach. And on the other hand there was the bare possibility of redemption—financial redemption—at the cost, the certain dreadful cost, of his honour, even if he succeeded, and the certain smaller cost of his life if he failed.

Oh yes, he hesitated. Be very sure of that! He had been born and bred to an honourable estate, and we may not palliate his choice by any consideration of the fact that many a man still more highly born has cast his honour to the winds to gain his own ends.

He had never fouled his honour in any smallest way, and it was harder far to part with it than to die. But he was also a man of proved courage. And—rightly or wrongly—he said to himself, 'By taking on myself this burden of shame and possible death I may be able to make amends and obviate the endless suffering I foresee for all the others. And what am I that I should refuse it? It is laid upon me by no will of my own, though of my own will I accept it! Be mine the suffering and the loss, so the gain be theirs!'

Wrong, utterly wrong, of course! And absolutely inexcusable!

The highest possible proof of true courage, you say, would have been inflexible determination for the right, regardless of any possible consequences. And I agree. And yet, even though it brand me lacking in highest notions of honour, I cannot but admire the curious texture and complexion of this man's courage.

The forlornest hope has usually a crown of glory for its prize; but this most desperate venture sought nothing for itself, and in coldest blood, and for the sake of others, entailed a life of certain misery and the risk of the gallows.

Possibly this very element of desperate risk counted with him in the balance. It would have been so easy for him to escape it all, and to him, perhaps, so despicable.

'As you believe in God, John Sax, tell me—do you believe there is reasonable chance of recovery?' said Lauriston at last, with the weight of the dreadful issue in every word.

'As I believe in God, Sir Charles, I believe there is, if we are spared to it,' said John Sax fervently.

And the clock ticked on and the balances still hung even, and the way of escape was still open. And old John Sax sat there with gray face awaiting his fate at the hands of this man whom he loved and honoured above all men, and who, to save him from it, must sacrifice all he held dearest in life. And the grayness of his face was not all for himself.

'There is no other way?' came muffled and dull from the hidden face at last.

'There is no other way.'

'Then it seems to me that I must travel it, John Sax, and may the God whom we are outraging have mercy upon us both!'

'Amen!' said old John solemnly. 'But have you weighed the whole matter?'

'I have done my best. It is a terrible road you set before me, John. But you shall not travel it alone. If it leads to the gallows we will go there together.'

And old John Sax drew a great breath and expired it in a great sigh. It might be of relief, it might be of much else, for none knew as did he, who had been through it all, to what his young master had set his hand, and all that it involved.

'Yes, it is a hard road, Sir Charles. God grant we win through, though I do not feel as if I had the right to take His name on my lips! It's years since I've dared to set a foot inside a church, and it's been a sore loss to me. I did try to keep on as usual, but somehow I could not stomach it, for it might have brought contumely on them, you see. So, instead, I've wrought more among the sick and the poor. That could bring no scandal on them whatever happened, and if I was hanged it was a comfort to think some would be sorry.'

Charles nodded grave understanding. 'I should have been happier as captain of a foot-regiment with nothing but my pay,' he said quietly. 'But as this thing is laid upon me, I will do all that in me lies to straighten matters, and it is to you, John, that I shall have to look for help.'

'If my life could clear us, I'd lay it down here this minute, Sir Charles; and that would be a sight easier than what we have to do.'

'God have mercy on us!' said Charles once more, with a break in his voice, and squared his shoulders to the fight.

*(To be continued.)*

# THE RUINS OF ANGKOR.

By ADA CHRISTIE.

WHEN so many English tourists go every year to Japan, it seems a great pity that so very few stop on their way to visit the Cambodian ruins of Angkor, ruins considered by many to be the most marvellous in Asia. During about six months in the year the journey can be very easily made from Saigon in Cochin-China, at which port the Messageries Maritimes steamers call. It should also be of interest to English people since the establishment of the *entente cordiale* to visit the flourishing French colonies of Indo-China, where they will certainly meet with every sign of friendliness and receive every help and politeness from officials of all classes. Given a slight knowledge of French, they will find travelling here very easy, even without the aid of Thomas Cook, and the hotels are fairly good. Angkor is now in French territory, the district having lately been acquired from Siam.

There is some uncertainty and confusion about the history of the great building race which raised these monuments, and the date of their erection has varied, according to different authorities, from the fifth to the twelfth century. But it was known that they were built during a period of civilisation which was Indian in origin and in religion, and which filled the land with splendid temples for the worship of the Brahmanical gods. Probably the city of Angkor Thom dates from the eighth century, and the temple monastery, Angkor Wat, from the ninth century. This civilisation seems to have been overthrown by the Siamese in the fourteenth century, and Angkor was deserted and soon buried in the jungle and forgotten. Efforts are now being made by the French to clear the ruins and to save the chief buildings from further decay.

The best time to make the journey is perhaps from the beginning of October to the middle of December, when the lake is at its highest level; but the steamers of the Messageries Fluviales run to within a short distance of Angkor from July to the middle of January. The price of the return ticket by steamer from Mytho (near Saigon), including food, is about three pounds seven shillings. The actual steamer journey on the river and lake lasts about forty-eight hours; but a stay of a day and a night has to be made besides at the hotel at Pnom Penh, the capital of Cambodia. Here there are some *wats* or temples to be seen, and the palace of the king, a very nominal ruler under France.

When the steamer reaches the head of the lake the passengers are rowed up the Siemrèap River in native boats for about an hour and a half, and then

have a bullock-cart drive of about the same length of time to Angkor Wat. Hitherto travellers have lodged here in the *salas* or rest-houses near the temple, large huts raised on piles, and have had to take with them servants, beds or mattresses, and all provisions; but an hotel with twenty-six bedrooms should now be ready, which will obviate this. If the traveller returns by the same steamer he has little more than a day and a half for visiting the ruins. He can, however, wait for the next steamer, a week later, and even then will probably find that he has not seen everything.

The great temple is within a walled enclosure measuring about two miles round. Outside the walls is a moat one hundred and sixty yards wide. This is crossed by a broad stone-paved causeway leading to a beautiful colonnade which stretches for one hundred and seventy yards along the western wall, with elaborate entrance gates and porticoes. Inside the walls a park once surrounded the temple, but much of it is now covered with jungle. From the gate a continuation of the paved causeway leads for nearly a quarter of a mile to the wonderful building which in popular legend was said to have been built by angels. It rises in three rectangular and receding terraces, from the highest of which spring five towers like immense pine-cones. The centre tower is one hundred and eighty-five feet from the ground. Round the terraces are beautiful corridors or galleries and double colonnades, with massive carved stone roofs and hundreds of windows filled with carved stone rails. On the lowest terrace is the celebrated gallery of bas-reliefs half a mile in length, covered with sculptured scenes from the Hindu poem the *Rámáyana* and other legends. These sculptures cannot, however, be compared for interest with those of the Hindu ruins in Java. The builders of Angkor were before everything decorators, and from the point of view of the extent and beauty of their decoration they surely cannot be surpassed. There is scarcely a plain stone. Every wall is diapered and covered with beautiful patterns, with friezes of graceful dancing sprites and panels with dancing women in floating draperies and wonderful head-dresses. The terraces rise in rounded lines and ledges and projections; the inside of courts and tanks is decorated with rows of lotus-flowers, or grotesque figures, or other patterns. Along the immense extent of corridor roof there is a profusion of ornament, and at the end of each section of roof there rises in an arch the Naga or seven-headed cobra, the original object of worship in this land. Whether it was incorporated in the Hindu religion or merely used as an ornament is not known; but the carved body of the snake and his immense heads meet one at every turn, forming double arches over every door and portico and on every tower, being used for every buttress or support, and composing miles of balustrade (now mostly destroyed) round the temple, moat, and causeways. In the centre of the four sides of every terrace and corridor and at each corner are magnificent colonnaded porticoes, the doorways having pilasters which are a mass of exquisitely carved foliage, sometimes as sharply cut as if done yesterday. There are beautiful colonnaded courts and long rows of decorated pillars, it is said five thousand columns in all. Innumerable steps lead to different levels, and there are twelve magnificent staircases forty-two feet in height all round the highest terrace. There are long vistas of corridor, with glimpses from windows and doorways over other beautiful parts of the building and from a height over the surrounding jungle. The five great towers are the least beautiful part of the work, and recall the *gopura* of the temples of south India. At each side of the square base of the central tower is a small shrine containing a modern gilt Buddha. This was the quadruple sanctuary of the god, probably Brahma, to whom the temple was dedicated; but all the Hindu gods have disappeared, and the Buddhist monks who live in huts round the temple keep up a few tawdry shrines. In all this wonderful building and in the buildings of the city and its neighbourhood no mortar or cement was ever used.

About two miles from Angkor Wat, reached by a rough bullock-cart track through the jungle, are the remains of the city of Angkor Thom. Its thirty-foot wall is still standing along most of its circuit of eight and a half miles. There are five arched entrance gateways surmounted by towers, which have on each of their four sides a large face of Brahma. Three-headed elephants, with bunches of lotus in the trunks, guard the entrance. Inside the city there is dense jungle, except where the cart-track crosses it and where clearings have been recently made round the chief buildings. These seem all to have been temples, so probably the palaces and houses were of wood. They are all a mass of ruins, with great trees growing in their midst and splitting the walls apart. One most weird and curious building, the Baion, has fifty towers of various sizes, each bearing the four huge and Sphinx-like Brahma faces. Many of the faces are worn and shadowy or split in two; others are tightly clasped by the long roots of trees. Some temples are pyramidal in shape, with galleries running round the different stages, and long, steep flights of steps on each side leading up to a small cella on the top. Later Buddhists began to make a colossal sleeping Buddha out of the stones of one of these temples, and the rough, unfinished outline can still be traced. The decoration of these buildings is in the same style as that of Angkor Wat, but it is simpler and there is less of it. Apparently the only secular erection is a long stone platform, the front sculptured with processions of elephants, which was probably the place from which king and court viewed games and spectacles.

An archæologist, Monsieur Commaille, is living at Angkor, investigating its ruins and those of the surrounding country; for everywhere, buried in thickest jungle, are to be found immense masses of shattered buildings, remains of extensive

monasteries and temples, with like ornamented corridors and colonnades and carved roofs, and all the profusion of ornaments, representing an unparalleled amount of labour.

For those who cannot make the journey before the middle of January it would be possible to do it later, although this might involve some discomfort. To a man, or even to a lady accustomed to rough travelling, the journey would not present any insuperable difficulty up to March or the beginning of April, unless it was a very dry season. The river steamers then only go as far as Pnom Penh, but small Chinese launches of a rough and dirty description continue to run to Kompong Chnang, where there is a *sala* or rest-house and also some French officials. From here a native boat would be necessary. This is about thirty feet long, and has over the centre an arched cover of bamboo and plaited palm-leaf. It is impossible even to kneel upright in it; but as the boat is boarded flat up to within about eight inches of the gunwale, a camp-bed can be put in. Of course a servant must be taken, but it is easy to get a Chinaman who can cook and speak a little French. All provisions and drinking-water must also be carried, as the lake water is very muddy even for cooking purposes. The length of the journey depends on the possibility of sailing instead of rowing, and varies from three and a half to six or seven days. The bullock-cart journey at the end would take about six hours. Of course, an introduction to the French Government at Saigon or to the Résident Supérieur du Cambodge at Pnom Penh would be an advantage; but even without this, travellers would certainly find the officials at the Residency most obliging and ready to give help and information.

# THEIR LOVE-STORY.

PART II.

DEATH visited The Chase, and the two girls were left lonely, and the absent young soldier was master. And then, how did it all come about? The Royalist cause was failing; the girls were alone and unprotected and in want, and surrounded by enemies; and Arthur, wounded, riding home from Warwickshire after Edgehill along the very lanes where he had so often ridden gaily in his student days at Oxford to his expectant home, found his parents dead, his sister a nun, and his sweetheart the year-old wife of another, the mother of another man's child—an old man, a stern Cromwellian, a man of harsh bearing. The wounded young Cavalier had hidden for days, at the peril of his life, in the neighbourhood, and then there had been a meeting. During some festivity at The Chase the wife had slipped out into the night—did she know her lover skulked among the trees?—and they had met. What happened none knew, no letter told. But next day the beautiful young wife was found drowned in the pond, and the old man and the helpless babe were left. Then Arthur had gone back to his king, had fought at Naseby, had fallen at Worcester, and just a few weeks before he died he had married—married a peasant girl, for some chivalrous reason told in a few bald words in a formal old letter; a girl without home or friends, who had done some good deed for the followers of her king, and was suffering for it. The little son—no mention of him occurred in any letter—must have been born after his father's death. It was supposed that Arthur Dabridgecourt, the gay Cavalier, had at that last meeting said or done something to his fair false cousin that was more than her woman's pride could brook, and so she had drowned herself. The fair fame of the king's man remained tarnished in the family annals. Was this the doing of the wronged old Puritan husband? Had he discovered his wife and her cousin in the wood? The estate had been confiscated, and had passed to the child she had deserted, who had taken the name of Dabridgecourt, and after the Restoration had turned again to the loyal party. 'And he was my ancestor!' Edith said. She took her hands from her face and leant one of them on the marble pillar, and raised her beautiful head. 'And the Cavalier, the Cavalier with the unhappy eyes—he does not look like a coward—he was *his* ancestor!'

She looked round her at the outlines of the trees in the dusk; she looked above her at the blue of the summer night's sky, thinly sprinkled with stars; she looked behind her at the great front of the house, with all its windows lit up. Then suddenly she gathered her satin train in her arms and sped across the lawn, two little feet in white satin disturbing the dew on the grass, and taking her to the rose-garden, where a hundred mingled fragrances greeted her. She slipped through the gap in the old yew-hedge, and never paused till she stood in front of the old ruin, the home of her ancestors, the old Chase, deserted a hundred and fifty years before, when the small rooms and winding stairs that had served the simple needs of the country gentle-people of the seventeenth century had proved inadequate for the more exalted ideas of their descendants of the eighteenth. The ruin stood grim and gaunt in the moonlight. A gardener lived in some of the lower rooms, but every one had gone up to the house to-night to catch some glimpse of the gay doings or to help the servants there, and so the gardener's door was padlocked and his windows dark. Most of the upper part of the ruin was roofless, and stood exposed to the winds of heaven.

Edith crept round to where the main entrance gave on to a broad, shallow stairway that broke off abruptly half-way up at a small landing where was one door—a stone doorway, with the Dabridgecourt arms and motto carved over it, and some remains of carving on the thick, studded woodwork underneath. This doorway and the shallow, broad bit of stairway with its famous carved balustrade—of which the balustrade in the picture gallery of the modern house was a copy—was the pride of the Dabridgecourts, and many strangers were brought to see it; but the door itself was barred and padlocked, for the room beyond it was dangerous, floored only with beams, with great gaps between some of them.

Edith paused at the foot of the stair. How many feet had gone up and down that stair! How many feet, quick and eager, or slow and dragging, speeding to love and happiness or going to weariness and misery; all those beautiful ladies whose pearls she wore to deck a beauty that had been theirs, whose blood pulsed through her heart! Edith stooped and looked at the shallow steps; they were worn by the passing of many feet, the feet of the dead. The steps were softly carpeted with moss. 'A carpet is spread for me,' Edith said dreamily. 'I am expected.'

She walked slowly up the ancient moss-grown stairway, letting the train of her gleaming satin gown fall and drag after her; walked slowly, gracefully, consciously, as women walked in the past. At the curve of the great stairway she paused. There was a bright light behind the studded door, gleaming under it, and through the great empty keyhole, and through the mighty crack that ran from hinge to bolt. As she paused her ear was greeted by a soft volume of indefinite sound from within. The modern girl, fearless, curious, strong in her self-reliance, walked on and pushed open the door.

In a moment, as it seemed, she was surrounded by them all. They were standing in a group, looking towards the door as if expecting some one, and she knew it was she for whom they were waiting—stately old men, beautiful old ladies, shy young maidens, gay gallants, velvets and flowered brocades and bright satins, swords and buckled shoes, and laces and jewels, powdered hair and rouged cheeks, and eyes looking at her, oh, so anxiously! And then, from out of the expectant group, dropping their stately curtsies and bowing low with old-time chivalry, there started a shy little brown-eyed girl in the habit of a novice, who seized Edith's hand in both her cold little ones that she scarcely seemed to feel. Edith yielded her hand. She felt no fear, no surprise. Her whole mind was concentrated on the feeling that something was expected of her, some momentous decision required of her. She stood in the centre of the crowd, this tall, modern 'Dana Gibson girl,' in her Paris ball-gown, and they clustered softly round her.

What was this they were all telling her, so eagerly trying to explain, with their courteous, old-world graces and gestures? She stood, straight and tall and fearless, her eyes seeking one face and then another, trying to understand, for no words reached her, only the eagerness of the eyes and the knowledge that they awaited her decision. And then—out of the gloom, at the edge of the richly coloured group beyond them—her eyes were arrested by one face. Where had she seen it lately? The blue satin coat, the rich lace ruffles, the Cavalier locks curling softly on to the collar, and the eyes—the sad, haunted eyes, so full of dignity and reproach—fixed on her, yearning, insistent, with the agony of a soul in torment? . . .

Ah, she knew it all now! How she had wronged that noble heart! What though they had told her he was dead? He had died fighting for his king. Was his a love that could die? What matter though she were all alone, in want, in peril—Cicely a nun, all who loved her dead, silent? . . . Ah! How she hated and feared him, the stern old man, with his pious phrases! He had told her Arthur was dead, and he had lied—lied! . . . Ah! She saw it all now—the shadows in the moonlit wood, and the one shadow that moved, the blood-stained bandage about his brow, the wan cheeks, the eyes that stabbed her, so that her reason fled. . . . Ah! What had she said to him, clinging to him there in the moonlight, washing the blood from his dear face with her tears and her lips? What had he answered her, so tenderly, so wearily? . . . Ah! She was to go back to the husband who had lied to her, to the child who was innocent; she was to remember the honour of the Dabridgecourts. She was to do this, that, in worlds yet to come . . . Ah! How cold the water was! how cold and sweet to die! . . .

'*You* were right! You saved me!' Edith Dabridgecourt cried suddenly, and she pushed through the group that parted to right and left of her; and, holding the little hand of the nun tight in one of hers, she stretched the other to that shadowy figure waiting in the gloom. 'You saved me, and you saved the honour of our house!' she cried. 'But I—oh! forgive me—I had not the strength to go back to him, as you bade me, only to die! And they have blamed you—blamed you all this time—you who were so noble!'

In a moment they were all fading from her, the eager anxiety in their faces gone, their eyes speaking thanks and blessing and gladness. Edith felt the hold of the little nun's hand relax, and looking down at her, met in her eyes a look of benediction. But the shadowy figure who had waited started forward, fell on one knee at Edith's feet, put his arms round her, and kissed the folds of her gown. 'At last!' he whispered. And Edith, looking down at the bent head, with the Cavalier locks falling on the lace collar, let her hand hover over it. 'Arthur!' she said.

. . . . . .

She was lying on one of the beams across the

floor of the great upper room of the ruin, among the cobwebs and the moonlight, when he found her. He put his strong arms round her, and carried her out to safety.

. . . . . .

The county said that Edith Dabridgecourt had treated Sir Edward Lennard very badly, and that it showed such utter lack of feeling to throw him over like that, after his long devotion, in favour of that young American stranger whom she had known for so short a space of time.

THE END.

# THE LAST CLAN-RISING IN SCOTLAND.

By JOHN FOSTER, Author of *The Luck o' the Spey*, *The Forgotten Rock*, &c.

OLD memories, pitiable, stirring stories of the feuds of the clans, haunt the mountains, the glens, and the lonely sea-arms of the Highland counties. Not a Ben but has seen fire and sword; not a Strath but has heard death-cries and the slogans of the victors. Dark old days! sad old days! but all in the weft of the tough, enduring web of Scots history.

A hundred names and figures rise out of the past, from the misty legends of the bards to the last real romance of these isles, in the '45. A holy war or a neighbour's vendetta, clear chivalry or black dissimulation, valour or bloody cruelty, cattle-rieving or high politics, the stories are in the main sad; but against the dark, red-tinged tartan of them shines a white redeeming streak, their invincible loyalty to a cause, or a man, or a woman. The Celt, they say, has an aptitude for lost causes, and this utilitarian age a faint, ill-concealed scorn for devotion to anything that does not pay. Yet loyalty is in itself a good thing. A loyalist often wins when he seems to a materialist world to lose; and the story of the last clan-rising, apart from its historical glimpse, is refreshing in its human interest, in the suddenness of its inception and execution, and in its striking evidence of the tenacious survival of a trait of the feudal system—for it happened not so very long ago, less than a hundred years ago—to be precise, on the 13th day of March 1820.

Of course the expression 'clan-rising' here means, not a fight between two Highland clans, but a rising for some common purpose. The last inter-clan battle was apparently between two Mackintoshes and the Macdonalds of Keppoch, at Glenrog, in 1688.

Happily, although the results of the 1820 rising might easily have been serious, it provides neither bloodshed nor the burning of clachans, and the curtain on the long drama of the Highland clan-broils rings down merrily enough on the rescue of a fair woman, in the old town of Elgin, and in the very shadow of the ruins of its gray cathedral.

It is necessary to hark back to trace the evolution of this somewhat remarkable event. The Laigh o' Moray, the rich lands of Pluscarden, the well-tilled acres where the Church—the 'Lanthorn o' the North'—reigned supreme round Elgin, were fat and tempting prizes to the lawless clans of long ago. We know that in the dim ages one of the Macdonalds of the Isles came a-plundering, and left both the Holy Church and the burghers lamenting; but, coming down the years, we hear little more of Macdonald's men, but a great deal of the powerful clan that held, and still holds, sway between the two Craigellachies—the Grants; and the finale of their last cattle-lifting expedition makes a very pretty story of chivalry and a well-kept word of honour. It is hardly necessary for this little record, but is worth the telling.

The Laird of Grant in 1691 cast an eye northward from his eyrie in Strathspey on the rich possibilities of Dallas, Pluscarden, and Duffus, in Morayshire. His men, returning from their successful foray, were caught by the Laird of Gordonstoun, and their leader ingenuously gave up a letter from the Laird of Grant, his warrant, so to speak, for his annexing his neighbour's property. Gordonstoun cannily sought to recover his goods by the sheepskin rather than the glaive, and got a decree from the Court of Session against the Laird of Grant for his losses. So far, so good. But the sheriff-officer who went to Strathspey had a rough time of it. Says the poor man, we 'were seized upon by a pearty of armed men, who most masterfullie and violently struck me with their gunnes; gave me a stobbe with a durke in my shoulder, and a stroak with my owen sword, . . . and offred his liffe to any one of our companie that would hang the rest of us; thereafter laid us doun and secured us with horse-roaps on the ground in the wood, where we leay in cold hunger and great miseries for four dayes and three nights, threatened hourly with present deathe.' So much for the king's writ in Strathspey in the 'good old days'!

And this reception of it was, an it please you, not to avoid payment, but as a protest by a Highland gentleman (who had merely 'lifted' some cattle) against the implication of non-intention to pay and the manner of the attempt to collect it! This is clear from the sequel, which is quaint but refreshing.

Sir Ludovic, the laird, had a son, Brigadier Grant, a man 'distinguished in the camp and the Court, and a bosom-friend of John, the great Duke of Argyle.' Possibly Gordonstoun knew all this, for when he was summoned, or at least invited, to go to Castle Grant to receive his debt in person, he

went. Straightway on receiving his money at Castle Grant, the knight handed it back, with the words, 'This is a present from Robert of Gordonstoun, and I will see my tenants righted myself.' The generosity was quixotic, but it bore instant fruit, for the Brigadier stood up and replied, 'If ever I am Laird o' Grant I will gar the rash bush keep the cow and the pin in the cot-door the sheep in a' time coming;' and this promise was sacredly kept. We hear of no more cattle-raids there, and of few risings until the one which forms the subject of this article, the principal figures in the picture still being of the clan Grant.

The blow over the heart to the Jacobites in the '45 saw the beginning of the end of the clans, as factors in the feudal system; but the ancient spirit survived, and nowhere with more vitality than in Strathspey. Cattle-lifting, as we have seen, had been stopped by the Brigadier Grant's promise in 1691. The Grants, by their numbers, their unity, and their geographical position, exchanged few blows with their neighbours. The protection that their strength gave to their clansmen was repaid in devotion and affection to the name and person of their chieftain. In the Peninsular war the 'good Sir James' raised, first, the Strathspey Fencibles, and immediately afterwards the Ninety-seventh Regiment of the Line, one thousand men, and all from the Grant country. When the Eagle swerved and fell at Waterloo, numbers of half-pay officers and pensioners, non-commissioned officers and privates, returned to the Strath, all of them, as will be shown, loyal clansmen, and needing but a slogan to make them rally round the House of Grant. Then came the death of George III., and, in consequence, a General Election.

The old rough cattle-lifting days had vanished, but the maxim 'Might is Right' still lingered, often leaping out suddenly in the heat of an election. Influence in politics was keenly sought after. The power lay in the hands of leading families, and incredible devices were resorted to by them and their supporters to keep that influence. Elgin was the arena of the political duel between the Grants and the Duffs.

In 1820 the Elgin Parliamentary Burghs consisted of Elgin, Cullen, Banff, Inverurie, and Kintore. To-day this grouping, objectionable in many ways, is continued, Peterhead having been tacked on to the original group. The Grants, through long association, swayed Elgin. The family had succeeded to the Seafield estates and title, and this commanded Cullen. The rival interest was that of the Duffs, who in 1820 held Banff and Inverurie. The system of election in vogue was for the Town Council of each burgh to elect a delegate. These delegates then met, and the election of the member was carried out by their votes. Thus the position of affairs then was: Kintore and Cullen were for Seafield, Banff and Inverurie for the Earl of Fife, while Elgin was doubtful. The energies of the Grants and the Duffs were centred on Elgin. These were rosy times for Town Councillors, political agents, and tradesmen, if somewhat trying to the patience and pockets of the candidates. The burgh potentates had to be continually patted on the back, made much of, feasted, and noticed. The system, of course, spelled corruption. Grant Lodge, the town mansion of the Seafields, was a House Bountiful. The ministers, the elders, the Magistrates, Councillors, and the Deacons of the Trades were generally invited to partake of their Sunday dinner at the 'big hoose,' and many are the stories of the hospitable mahogany.

But, alas! as in the days of Ossian:

> In Alpin, in the days of the heroes,
> Fingal neglected to call some of the Fingalians to the feast he gave at Druim Dialg,
> The proud rage of the heroes was aroused.

When Prince Leopold visited Elgin, Colonel Francis Grant waited at the town's marches, gave him the freedom of the city, and invited the Provost and Town Council to dine with the Prince in Grant Lodge, while the townsfolk fed amply, but with less dignity, on the lawn. The Deacons of the Trades, however, by a pure oversight, had been left out of the invitations by the Town Clerk. They took great offence, and refused either apologies or offers of the entertainment there or at any of the inns, and proceeded with their backers to the Trades Hall to feast and smooth their dignity at their own charges. Once there, they broached a cask of whisky, and their dignified counterblast ended, painful to relate, in their getting roaring drunk and annoying the lieges. All this may seem unromantic, even vulgar detail, but, strangely enough, it was this rift that grew to a wider one in the electioneering lute, and led to the last clan-rising in Scotland.

Mr Archibald Farquharson of Finzean was the Seafield nominee, a supporter of the old order; while General Duff, a brother of Lord Fife, was the Duffs' candidate, and was supposed to be more on the side of reform.

Lord Fife was then in his prime, a great favourite, generous, gracious, popular. Here was an opportunity to further his brother's interests and recover the parliamentary control of the burghs; for the offended Deacons had great influence with the freemen of the burgh, and possibly could control the deciding vote in the Council. His lordship often lived in the town. He called here, sent invitations there, was the soul of affability to the citizens and their wives and daughters. We hear of presents of rings and shawls, of gowns and ladies' gear galore. He scattered money freely among the lower orders, until when he went out he was actually followed by an admiring train of sponging idlers. Canvassing went on merrily. The delightful, free-handed Earl was gaining ground. Excitement rose to boiling-point, for, out of seventeen Town Councillors, seven were for the Duff, eight for the Seafield interest. Day and night intrigues, bribes, bullying, cajoling, every form of influence was tried by both sides to strengthen their numbers on the Council.

Then rose a rumour that the Grants had tried to carry off Lewis Anderson and James Culbard, two of the Fife supporters. Man-stealing was an incident of last century's early electioneering, and it is certain that, if they were wrongly accused in this instance, the Grants of seventy years before did kidnap the Laird of Kinsteary, who had actually presumed to oppose their chief; and, further, they settled the election by carrying him away to the hills until the Laird of Grant was returned for the county!

Whether the attempt in 1820 was a *bonâ-fide* one, or the report of it 'engineered' by the other side, need not be inquired into; but the Duffs' ire was roused, and they determined on a smashing counter-stroke. On the 11th of March, when a douce Councillor (Mr Robert Dick) was taking off his shop's shutters, he was seized from behind, blind-folded, carried up Craig's Close, and round Batchen Lane to Mackenzie's Inn, in Elgin, where a carriage was waiting. His dutiful daughter (who, by the way, had been soothed by two diamond rings) provided him with a change of linen, and the poor man was taken to Burghead, clapped into a boat, and set on the other side of the firth at Dunrobin. There he was hospitably entertained until after the election of a delegate, and then came home leisurely by land.

The same adventure befell no less a personage than a Bailie of the ancient city. Bailie Taylor was captured and carried off; but the seas were unkind, and after a voyage in peril of their lives he and his escort managed to reach Brora, after a passage of seventeen hours!

The coast clear, the Fife party coolly proceeded to call a Council meeting. The Grants refused to attend; the Town Clerk refused to attend; but they arbitrarily chose another and more docile Clerk, and fixed the Wednesday following for the election of a delegate.

The old town was in a white-heat of excitement. Money was mysteriously plentiful. The change-houses were full. Gangs of idlers roamed the streets. Partisan fights flamed up at all hours. Grant Lodge, the Seafields' Elgin house, was the storm-centre, for there Lord Seafield lived in retirement, along with his sisters, Lady Ann and Lady Penuel.

The central figure of this little record, the beautiful Lady Ann, was, we are told, of 'commanding presence, great wit, and force of character.' Her qualities and charm endeared her to her friends; but the Elgin mob did not scruple to insult and jeer at her in the streets, and in the evening encircled the house, howling doggerel verses, oaths, and venomous party cries. 'Doon wi' the Grants!' 'May the Deil pick oot their e'en!' 'Up wi' Lord Fife!' and the like cries made the night hideous. So badly did the cowardly mob behave that at last no one could leave or enter Grant Lodge.

The Lady Ann was, however, a woman of pluck and resource, and on the Sunday morning one of her grooms escaped on a horse, and galloped post-haste to Castle Grant, the gallant beast, it is said, covering the distance—thirty miles—in three hours, and falling dead at the Castle door.

Instantly Strathspey was ablaze. 'Stand fast, Craigellachie!' travelled through the glen like the wind. At Grantown the clansmen turned from the kirk-door at the tuck of drum, and in Cromdale the Reverend Grigor Grant stopped the sermon, intimated the call to arms, and offered a prayer for its success in the Gaelic. Within two hours three hundred men, with the minister at their head, started shoulder to shoulder for Elgin. At the same time Captain Grant, Congash, the Strathspey factor, sent messages in all directions. Abernethy responded nobly. So did Duthil (in the Gaelic, 'Gleann Chearnach,' the Glen of Heroes), under Patrick Grant of Auchterblair, afterwards Field-Marshal Sir Patrick Grant. No fiery cross ever had a more rousing answer than the news that the beloved Lady Ann was in danger. The whole Strath turned out and marched to the rescue.

At Elgin, those of the Council favourable to Lord Fife were in Mackenzie's Inn, a strong body of burghers guarding them. At about three o'clock on Monday morning the house was awakened by a Fife tenant called Inkson, from Speyside, who had ridden post-haste with the news that the Grants were up in arms and at the town's gates calling for blood. The sleeping burghers were awakened by the town's drum, the blowing of bugles, and the clang of bells, and soon they were tumbling over each other in the streets, many half-dressed, women and children shrieking, consternation on all faces. For the rumour had grown, and wild stories fed the panic. The Council, so far from representing the burghers, were escorted for security to the Tolbooth, and a guard mounted there for their protection.

The more reckless mustered at Grant Lodge gates, armed with what weapons they could lay hands on.

Meanwhile upwards of seven hundred Highlanders were well on their way. Astonished folk, awakened by the tramp of feet, asked, 'Whaur 's the market?' 'Och, just at Elgin the morn,' was the answer. Quaintly enough, considering their errand, the accounts state that they waited until the Sabbath was over, and then ordered Peter Bane, the famous Abernethy piper and fiddler, to play up. About two miles from Elgin they halted for a short general review, and the march was continued in military order.

They entered Elgin at five o'clock in the morning, marching up what is now Moss Street, to the strains of 'O Pharig nis seid suas gu braishi,' to Grant Lodge. The sight of the seven hundred brawny clansmen was enough. It was a bloodless battle. The burghers fled, and the Lady Ann was soon among her own people, amid resounding cries of joy and welcome.

General rejoicings followed. Meat and drink for the miniature army was an undertaking, but several

bullocks were killed at Linkwood, provisions laid out on the lawn, and casks of whisky broached. Toasts were drunk, inflaming the already excited Highland blood. They were 'spoiling for a fight;' and the authorities were still alarmed. The Provost, entering Grant Lodge by a back door, went on his knees and begged Lady Ann to interpose and help to keep the peace. The Sheriff and the clergy too waited on her, and in the end, after an assurance that special constables would be sworn in for the protection of Grant Lodge and its inmates, the Highlanders agreed to march home again.

They went by a different route, Lady Ann sending orders to every inn on the road for their delectation. At Forres they made merry, pipe-playing, singing, dancing till the morning, when these lusty souls marched on to their native glens without a halt.

Elgin continued in a ferment for days. Special constables drilled; patrols were organised, pickets and sentries placed. Lord Fife's tenants began to pour in, and at night, after a false alarm, a general parade took place. The windows were ordered to be lighted to detect any Highlander in hiding; but the clansmen were well on their way home, with the exception of a few for whom the mountain-dew at the Lodge had been too much.

On the night of the election the Sheriff marched at the head of the constables for the preservation of the peace. None of the Grant party appeared, and the Fife interest again had a meeting of their own. A number of party meetings took place; but the end of the matter was that Mr Farquharson, the Grant nominee, was declared elected by the Provost's casting vote, and duly sat in the House of Commons.

The kidnapping of the Bailie and the Councillor was reported to the Lord Advocate, and four of Lord Fife's supporters tholed an assize at Inverness on a charge of stellment—that is, man-stealing. They were defended by John Peter Grant of Rothiemurchus, the namesake and ancestor of the present Sheriff-Substitute in the Highland capital; but a flaw in the indictment, convenient or otherwise, spiked the prosecution's guns.

So ended the election that caused the last clan-rising in Scotland. A skeleton account is given in Young's Annals of Elgin, while a fuller one is enshrined in the Gaelic Society's Transactions. The account, apart from the rising, throws a curious light on the rapidly fading picture of the old electioneering times and manners. To us nowadays, when the electors can only be bribed by platform promises of the millennium, when a shilling given for a vote or the innocent act of a careless candidate or agent will invalidate an election, the thought of a town feasted, bribed, and befuddled for months, two of its rulers kidnapped, and—well within a hundred years ago—seven hundred clansmen marching down on it to the rescue of a lady interested in the election, borders upon comic opera.

But the story is redeemed by the bright qualities of courage and loyalty. Let us remember that the Highlanders expected to fight their way against well-armed angry thousands; that they never hesitated; that they marched long distances in an amazingly short time; that when their mission was accomplished and they found themselves in superior numbers to their opponents they observed the law and kept the peace.

The story obeys the convention of fiction in the reward of the heroine, for the news of the chivalry abiding with these men of the hills reached high quarters. While the fair lady was dancing at the ball given by the Peers of Scotland when George IV. came North, he asked one of the lords-in-waiting to point her out. This was done, and the First Gentleman observed with decision, 'Well, truly she is an object fit to raise the chivalry of any clan;' and not long afterwards the Lady Ann was raised to the peerage.

To-day the scene of the last clan-rising is in a beautiful park, given to his native town by Sir George Cooper of Hursley. Grant Lodge stands there still, and retains its name, but Elgin's Library, Reading-room, and Art Gallery take the place of the banqueting and ball rooms of long ago, and a fine Drill Hall stands where the wild Highlanders feasted and toasted after their bloodless victory.

The Lossie winds near, among the trees. The old eyes of the cathedral, full of memories, look down on a scene peaceful to somnolence. On this still autumn evening it is curious to recall the stirring times that this quiet corner of Scotland has seen, from the Wolf of Badenoch's swoop long ago to the last clan-rising in 1820.

Times are, happily, changed! But though the days of forays and clan-feuds are over, their more enduring root-qualities of courage and loyalty have, let us hope, borne fruit; and as I write this, at one of the windows where, no doubt the Lady Ann listened for the slogan of the Grants, the sound of a piper practising in the Drill Hall reminds one that instead of holding in its arms rival cattle-stealing, fighting hordes, the fair province of Moray now sends to that fine regiment the Seaforth Highlanders many hundred loyal claymores for King Edward the Seventh.

# THE MONTH: SCIENCE AND ARTS.

### AN ANTI-FORGERY ELECTRIC PEN.

THE latest acquisition to the commercial office is an ingenious little device the object of which is to render forgery absolutely impossible. The apparatus comprises a small desk a few inches square, fitted with a glass lid, to a portion of which is fixed an aluminium plate. The desk itself contains the essential electric mechanism, consisting of a small accumulator, coil, trembler-blade, a special secondary condenser to render the spark larger and more intense, and an ingenious device which is described as an 'etheric buffer'—a small tube exhausted to a certain point, which is practically a Crooke's tube such as is used in X-ray photography. This tube is designed to take up all resistance and strains that otherwise would be thrown back upon the coil, and which might seriously impair the efficiency of the latter. When any resistance is encountered to the passage of the electric current from the pen-point through the writing medium, this tube commences to glow in precisely the same manner as the Röntgen ray tube, its vivid colouring varying in intensity according to the extent of the resistance. From the coil the intensified current is led through a short length of flexible wire to the barrel of the pen, which in shape and design resembles the ordinary fountain-stylograph. In the barrel is a special design of mercury-interrupter which cuts out the current until the pen is held in the writing position. In the point of the pen is a small piece of metal with which the writing is effected ; but this is connected to a small piston contact within the pen, and must be pressed inwards before the current reaches the stylo-point. Consequently, when writing, it is not only necessary to hold the pen in the writing position, but the point must be well pressed on to the paper before the current makes an impression thereon. The paper is laid on the aluminium plate, and the current flowing from the pen-point at a pressure of ten thousand volts burns its way through the writing material in the form of a small perforation. The letters are thus outlined as it were by pin-pricks, which arrangement prevents the circular interior parts of such letters as o from falling out. The ingenious system of contacts adopted within the pen-barrel completely protects the user from shocks, so that the pen may be used with absolute safety by any one. The spark is of sufficient intensity to burn its passage through six to eight superimposed sheets of ordinary paper, so that the pages of a document may be attested simultaneously, and each is an absolute fac-simile of the other. The perforated outline of the letters is irregular, as the current follows the path of least resistance through the paper, and it is quite impossible for one to forge a signature, since no two signatures are made alike. For signing cheques, bonds, and other papers the pen is of incalculable value, and should prove an excellent acquisition to mercantile establishments.

### READY-MADE CANADIAN FARMS BY EASY PAYMENTS.

The hire-purchase system has entered so extensively into our everyday life, and has proved such a boon to all and sundry, that the latest development of the idea will arouse considerable interest. This is the laying out of ready-made farms in the wheat-belts of North-West Canada, a scheme which has been elaborated by Sir Thomas Shaughnessy. The idea is to erect a home and barn, stock the same, and plough and plant forty acres of a one hundred and sixty acre plot with grain, so that the newly arrived settler, directly he reaches his new home, may be able to continue farming just as if he had returned to his English farm after an absence of a week or two. The price of such a ready-made farm will be about eight hundred or one thousand pounds, and the tenant enters into possession upon payment of 10 per cent. of the purchase-price, and the balance in ten annual instalments. Such a scheme will enable every emigrant possessing, say, one hundred pounds when he reaches the Dominion to become his own master, for obviously a scheme entailing such a small outlay will attract a larger number of prospective farmers than if it were necessary to lay out a thousand pounds at once. The farm being already a going concern, the new tenant will be able to commence work at once, and till the balance of some one hundred and twenty acres of the plot for the next season's crop, while the part already planted before his coming is maturing. On the basis of three pounds of profit per acre, the forty acres would yield, say, one hundred and twenty pounds, from which would have to be deducted the eighty or one hundred pounds payable to the owners. The next year, the whole area being under cultivation, a handsome balance would be left on the year's working after paying the annual instalment. This is one of the most attractive schemes that has yet been elaborated for drawing the British farmer to the bounteous North-West of the Dominion ; and as arrangements are provided for enabling the farmer to extend his acreage as he prospers, he can obtain the freehold of a farm of three hundred and twenty acres within the course of a very few years, and well establish himself on the road to independence.

### AUXILIARY MOTOR-WHEEL FOR BICYCLES.

An inventor has contrived an ingenious and efficient means of converting the ordinary pedal-propelled bicycle to a motor-driven one whenever required. The advantage of the idea is that the motor device can be attached and detached in a few minutes, and does not involve any structural altera-

tion whatever to the mechanism of the cycle; while, when it is attached, the pedalling movements of the rider, whether a lady or a gentleman, are not impeded in the slightest. The attachment comprises a small wheel twenty inches in diameter, shod with a motor tire. This wheel is equipped with a horizontal frame fitted with a one and three-quarter horse-power petrol, valveless, two-stroke motor, to which is coupled up a special type of carburettor and magneto-ignition, the latter being driven by encased bevel gearing. The hub of the wheel carries the engine flywheel and the special six-to-one reducing-gear. The question of the petrol-tank is solved in an ingenious manner, for it is fashioned in the shape and fulfils the duty of a mud-guard. This tank, in addition to carrying sufficient petrol for a journey of a hundred and twenty miles, has also accommodation for a small supply of lubricating oil. The wheel is attached to the bicycle by detaching the rear wheel spindle-nut on the chain-side, and slipping the motor-wheel frame on to the spindle, after which the nut is replaced. The motor-wheel frame is so designed as to permit of certain vertical and lateral movement, so that any vibrations arising from the uneven road-surface are not transmitted to the rider, and no impediment is offered to turning or steering. A single control-lever clipped to the handle-bar, and connected to the motor by a Bowden wire, governs all the movements of the engine, and the pace can be adjusted to a nicety in the most congested traffic. To start off it is only necessary to pedal the machine for a few yards, when the motor takes up the propelling action, and a steady pace of fourteen miles an hour over roads of different gradients may be maintained. When desired, the machine can be reconverted to a pedalling cycle by the detachment of the motor-wheel; and the latter can be easily attached to or detached from a lady's cycle, or taken from a lady's and attached to a gentleman's machine, or *vice versâ*, in a few seconds, as it is made interchangeable. It is certainly the most ingenious and efficient auxiliary power-device that has yet been contrived for combination with the ordinary bicycle.

### TALKING MOVING PICTURES.

One of the latest applications of the kinematograph is the combination of moving pictures with the phonograph, whereby both action and sound are produced. During the past few months several devices of this type have been elaborated, all of which are carried out more or less upon the same lines. The phonograph produces the sounds, either of a song or speech, and the effect is so produced that the movements of the mouths of the characters on the screen synchronise with the utterance of the phonograph, so that the figures in the photographs appear actually to talk and sing as they move and act. The general means of insuring synchrony between the two machines is by means of dials. On the front of the phonograph is a small dial with an illuminated hand which revolves as the record is played. On one corner of the film is another small dial, the hand of which likewise rotates, and the operator at the projector has to see that the movement of the hand on the picture dial corresponds with that on the phonograph. The result is not quite perfect, as it entails no little skill on the part of the operator to keep the speed of the projector-handle the same as that of the phonograph, otherwise lagging or advance on the part of the picture-projection ensues. The best arrangement of this kind that has yet been evolved is that of a French inventor. In this instance the phonograph, though placed beside the screen and therefore some distance from the operator, is nevertheless controlled by him, as the phonograph is electrically driven, and the arrangement is so devised that the picture and phonograph must maintain absolute simultaneous movement, since they are operated together.

### COLLECTING ATMOSPHERIC ELECTRICITY BY RADIUM.

There has recently been exhibited a highly ingenious device for collecting electricity from the atmosphere by means of radium. The apparatus consists of a spiral piece of metal which is coated with soluble salts of radium. This spiral is suspended from a special weather-proof insulator attached to some elevated device, such as a pole, balloon, or kite. The radium ionises the air, enabling the aerial to acquire the potential of the elevation. At the base of the aerial is fitted an electroscope, which is so arranged as to discharge to earth automatically every few seconds. By this means electric chimes may be operated by radium-collected etheric electricity, and many other interesting experiments effected.

### THE FIRST AFGHAN BRIDGE.

Afghanistan, which has so long been a closed country, has at last succumbed to the march of civilisation and modern science, for the first metal bridge in that country has recently been erected by the leading bridge-building engineers of the Indian Empire, Messrs Burn & Company, Limited, of Calcutta. The bridge, which has a span of three hundred and six feet, is of the suspension type, and is thrown across the Kabul River at the mouth of the Diroontah River, seven miles from Jelalabad, almost on the spot where the Tenth Hussars lost several men in fording the waterway in the 1842 campaign. The bridge has a width of ten feet, and was built to give pedestrian and vehicular communication between the two countries. Owing to the extreme ruggedness of the country, its erection was a difficult task, especially in regard to the approaches, which had to be blasted out of the solid rock fringing the famous river at this point. Yet despite this heavy tussle with Nature, and the fact that native labourers who were entirely foreign to the work had to be employed, the bridge was completed in the

actual working time of five months—a remarkable performance considering the conditions prevailing. Hitherto a quaint native raft-ferry has sufficed to maintain communication between the opposite banks, and has long proved totally inadequate for the increasing traffic. The ironwork was prepared in India at the famous ironworks of the engineers, now a century and a quarter old, and the bridge was opened amid much jubilation and ceremony by his Majesty the Amir, who delivered an impressive speech, emphasising the great advantages of the structure as compared with the old and dangerous methods of crossing the river. The hillsides were packed with hordes of interested natives, and the opening of the bridge was a topic of conversation for several days, the Afghans experiencing a quaint delight in crossing and recrossing from one side of the river to the other by this means.

### AN INSTANTANEOUS GAS-LEAK INDICATOR.

The dangers of leaking gas are only too well known to require repetition, and now an ingenious and simple little device has been evolved which enables such an escape to be immediately detected. The principle of the indicator is in accordance with a well-known scientific law—that of the diffusion of gases—and this is turned to novel advantage. In appearance the device resembles a small watch, and the mechanical application of the fundamental principle is effected by the use of an elastic metal chamber, the bottom of which is formed of a porous tile through which the diffusion takes place. The dial of the indicator is marked on one side of the zero mark 'Light gas,' and on the other 'Heavy gas,' and there is a cock connecting to each section. When the detector is brought into an atmosphere contaminated with gas the gaseous atoms diffuse through the porous tile into the closed chamber with greater rapidity than the enclosed air passes out, thus causing pressure by increased volume upon the elastic surface of the chamber, and the motion thus given is communicated to mechanism which causes the dial-hand or index-finger to move one way or the other over the dial. In the course of two or three minutes the maximum effect of the gas is attained, as the needle ceases to move. The two cocks already mentioned are left open until an observation is about to be made, and then, before investigation is carried out in a suspected area, they are closed and a brass cap placed over the porous tile. When the contaminated atmosphere is entered this last-named cap is removed, and instantly the presence of any gas is positively betrayed by the movement of the dial-hand. For detecting existence of gas the little instrument is extremely useful and infallible.

### ELECTRICITY FROM THE WIND.

Since we mentioned, some months ago, the great strides that have been made on the Continent in connection with the harnessing of the wind to furnish electricity for power and lighting purposes, English engineers have devoted their attention to this problem, and now it is possible to secure a complete plant to fulfil varying requirements at a nominal cost. A typical installation of this type has recently been placed in operation at a private country residence in Worcester. The wind-wheel or turbine is twenty-four feet in diameter, and is mounted on a steel tower seventy-five feet high, and placed some four hundred yards from the house. At the foot of the tower is a small electric generator driven by the revolving wheel above, and the current is transmitted to the house by bare overhead copper wires. The wheel runs at speeds varying from four hundred to sixteen hundred revolutions per minute, and the electricity furnished by this means serves to light the house (about one hundred lamps being distributed over the building), and drives a chaff-cutter, a circular saw, and a root-pulping machine. The accumulator battery from which the energy is drawn and the controlling instruments are installed in a small outbuilding, so that the whole is very compact and easy of access. The plant is entirely automatic in its action, and the wheel can be stopped and restarted when required with perfect ease. Similarly, should there be an excessive wind-velocity, the special tails fitted to the wind-turbine tend to bring the wheel out of the wind, so that the predetermined wheel-velocity may not be exceeded. It has been found that fourteen units of electricity have been produced in twelve hours with a wind averaging fifteen miles per hour; but, taking the average wind-speed in the neighbourhood where the plant has been erected at about nine miles per hour, this is sufficient to supply about five thousand units per annum. Considering that the number of days per year when no wind prevails in these islands is so small, it is surprising that greater advantage has not been taken of this inexpensive means of securing electric energy for various purposes. Certainly it solves the question of enabling country houses to secure a constant steady light of the most scientific character at a very small cost.

### COLOUR-MATCHING BY ARTIFICIAL LIGHT.

A valuable discovery has recently been made and an invention placed on the market which will be hailed with satisfaction by almost every one connected with the textile trades. Most people are aware of the difficulty with which the process of matching colours by night is fraught, and especially colours which are presented in fabrics made from wool, cotton, or silk. Colours which appear one shade by daylight look totally different in the light of gas or electricity, and when the dark days of winter or the thick fogs of November are prevalent much time is lost in waiting for daylight to match the colours. The discovery consists of a process which eliminates the pernicious yellow rays from artificial light, and presents the material to be

matched in its proper shade. The invention to carry out this process takes the form of a screen known as the 'ora' colour-screen, which is a neat, flat, blotter-like arrangement composed of sheets of coloured transparencies in combination. The material to be matched is placed on one end of the screen, and the other end is bent up in concave form so as to reflect the light upon the material. The effect is obvious, for on a small pattern being cut in two and one part placed on the screen and the other held away from it, they will in many cases appear to be of quite different shades. For drapers and dealers in fancy silks and such-like articles the invention will prove most useful, since it will admit of matching colours at all times of the day or night. The screens are sold at the modest prices of five shillings, seven and sixpence, and ten shillings. The inventor is a gentleman well known in the woollen trade in the West End of London.

### SISAL HEMP IN YUCATAN.

There is an interesting chapter on the raising of henequen or sisal hemp from the plantations in Yucatan in the volume entitled *The American Egypt, Travels in Yucatan*, by C. Arnold and F. J. T. Frost (Hutchinson & Co.). From this source the growers are said to have derived eighty million pounds sterling within the past fifteen years. The fibre known as sisal hemp is obtained from a species of cactus, the *Agave Sisalensis*, first cultivated around the port of Sisal in Yucatan. From its fleshy leaves is crushed out a fine fibre, which resists damp better than ordinary hemp, and is valuable for making ships' cables. It is very largely used for the corn-binding machines of America and Canada, where wire cannot be used, while sisal is strong and cheap. The first plantation was founded in 1850, and the demand for the fibre was slow at first. The Spanish American war of 1898 gave it a boom, when the Manila hemp crops were destroyed or stopped. Now more and more ground is being reclaimed for its growth. The leaves are cut from plants at the end of the fifth year; the average yield of each plant annually is thirty-two leaves. These are crushed, and the fibre is extracted, dried in the sun, and pressed into bales for transport. There are now four hundred plantations, which yield about four hundred per cent., through their being worked on a system which the authors of this book say is virtually the slave labour of Mayan Indians, and which is by them duly exposed.

### STAMP-FIXING MACHINE.

This machine is the outcome of a long series of experiments by Mr. C. Michaelson, as absolute accuracy combined with simple yet strong mechanism was necessary to make it a commercial success. It weighs between nine and ten pounds, and is enclosed in a locked case made of polished oak suitable for office desk-work. The stamps are inserted in the machine in spool form, the Government having under consideration at the present time the printing of stamps in spool form to supply those who may wish to use such a machine. The stamps are fed to a pair of pressure rollers, and by the act of raising the master-lever in front of the machine a stamp is fed forward to the perforation-line and just clear of the feed-slot. On the lever being brought down it engages first with a cutting blade which separates the stamps at the perforation, when the blade springs clear, and the lever engages the pressure-pad which affixes the stamp to the letter. The moistening is done by passing the letter or card to be stamped through and under a flat metal tube containing a wick hung on a light-tension spring which enables the moistener to adjust itself to any thickness of letter. The moistening apparatus is supplied with water from a feed-tap connected to a suitable metal chamber. Each full lift of the main lever actuates a check counting-arrangement, and indicates on a dial the number of stamps used. The machine is capable of stamping five hundred letters in twenty minutes. It is claimed for this invention that it is a great time and labour saving device, and that it is hygienic in its action, as stamp-licking is entirely superseded. There can be no pilfering of stamps where the machine is in use, the stamps being under lock and key, and every one used is recorded. The entire operation of bringing a stamp forward, cutting it off, affixing it, and recording takes but one second. The machine is made in single or double movements, to supply halfpenny and penny stamps, or each only; while the price is a moderate one, to make the machine popular.

*To Correspondents* who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

## BECAUSE.

Because I love you, lonely, silent places
Are musical with echoes of your voice,
And stars and flowers and little children's faces
Flash back your smile and make my heart rejoice.

Because you love me, I have utter loathing
For all that is not high and pure and true;
What I have been is in my eyes as nothing
To what I will be, growing worthier you.

Because I love you, all I love are dearer,
All beauty is more beautiful to see;
Because you love me, God Himself comes nearer—
The God of Love who gave your love to me.

R. Ada Tyack.

### *** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

# THE MAJOR'S CLOCK.

By A. W. ARNOLD, Author of *The Colonel's Murillo, At the Sign of the Silver Bell,* &c.

## CHAPTER I.

AFTER the restoration of the Bourbons whole regiments were disbanded, so I, like many a better man, received my *congé;* and in disgust I shook the dust of Paris off my feet and returned to my paternal home. It was rarely I found myself in the capital, but having to go there on some legal business three years afterwards, I naturally made my way to my old haunts, on the chance of meeting some old comrades. There were many military cafés, but Helder's and Lembling's were the most famous, and just leaving the latter as I approached it, whom should I meet but my old friend François Dorisart. I had not seen him for five long years, when we were in hospital together from wounds received on the disastrous day of Salamanca. Of course our delight was mutual. He told me he had come into a fortune, and that he was married, and lived in the Quartier St Germain. He insisted on my taking up my sojourn there while I remained in Paris.

'Well, Dorisart,' I said as we sat smoking in the evening, 'you have certainly fallen on your feet. You have a very beautiful and charming wife, a splendid house, and,' I added, pointing to a magnificent bronze gilt clock above us on the mantelpiece, 'some fine things in it.'

'You are right there,' he answered. 'And as for that clock, *mon ami,* it is my "mascot;" nothing would make me part with that; and I will tell you how I got it.

'Two months after Salamanca we were ordered to start for Russia. We had got as far as Pampeluna, when I and many others caught typhoid fever. Fully one-third of those who caught it died; and, *ma foi!* it left me as weak as a rat. The regiment of course continued its march, but the colonel left a brigadier and a dozen men to look after us. As the medicine major said we should not be fit for service for months, and as we should only be an incubus if we remained, we were told to go to Paris, where we were to report ourselves to the medical board. I had a carriage to myself, and the others, about two dozen of them, were in wagons. We were within five leagues of Irun, on the frontier, when we stopped at midday at a monastery.

'My father was a general, but he was killed at Marengo. My mother's family was ruined by the Revolution, so she had but a wretched pittance of a pension to exist upon. My only brother, who had been a notary, was dead, so that it fell to me to supplement her little income as best I could. All the loot I had gained had been lost at Salamanca. As it was on the great highway to Spain, everything of value in this monastery had been taken long ago. Still, seeing that it was the last chance I should have, I determined to have a look round, and, as good-luck would have it, hidden away under some cassocks in the sacristy I saw that very clock, which, besides telling the time, showed the day of the month, and though I did not know it then, it had also an alarm attached to it.

'"Oh, that clock does not belong to us," said the abbot; "it was only left here last night by a nobleman."

'"Oh, very well," I replied, "as it does not belong to you, I may as well take care of it;" and I ordered it to be taken to my carriage.

'However angry the abbot may have been, with marvellous cleverness he dissembled his wrath.

'"You are weak from fever," he said. "I will return good for evil; I will give you some wonderful old Solera that will completely restore you."

'We were on the point of starting, and I hesitated; but he pressed me to try it, and, like an imbecile, I fell completely into the trap. He soon returned with a very old crusted bottle. The cork certainly came out very easily, but I thought nothing of that. Filling a glass, he offered it to me. Now as he, so he had told me, had spent a good

[*All Rights Reserved.*]

deal of his life in Rome, he was soaked with the traditions of the "Eternal City;" so I was not such a fool as to taste it before he had had some himself, and I told him to drink that glass and give me the next. The rogue trembled all over and turned as white as a sheet.

'"Go," I said, "before I put a bullet in you;" and this he did, remarkably quickly.

'But as he had this fine wine in the place, and thinking it might be good for those who had been ill, we made the monks show us where it was kept, and as we drank some of it there, we lost a little time. This was just what the abbot had desired in the first place; for though the delay was not really very long, it was long enough for his purpose. So many guerillas had been strung up for one thing, and we were so near the frontier for another, that perhaps the men grew careless. Anyway, we had not gone far when we found ourselves in the middle of a short but very dangerous pass.

'"*Prenez garde*," suddenly shouted the brigadier.

'I sprang out of the carriage in a moment, and looking up, I saw on a crag, at a giddy height—a height which only those shod with the hemp sandals that we call *espadilles*, and the Spaniards *alparagatas*, could ever reach—two of the monks and a couple of men. One of these latter was armed with a blunderbuss.

'The next moment they poured a volley into us, and this was taken up by two others, who had remained *perdu* till we had passed, rather lower down, a little in our rear. The bullets did us little harm, for they were wretched marksmen; but the pellets from the blunderbuss peppered the mules of my carriage, and the frightened animals darted off, and the next moment, the front wheel striking a stone projection, the vehicle toppled sideways against the side of the road. In a moment our fellows had dismounted and returned the fire. We soon silenced the two in the rear, but with those who were higher up it was quite another thing. Had they only been good marksmen they might have picked us off one after another; but the one with the blunderbuss caused no end of trouble. True that for killing purposes he was too far off, but the confounded shot excited and stung the animals, and of course the troopers also, and many of the helpless invalids were injured.

'Vainly I shouted that I would give a louis to the man who brought the fellow down.

'"It is no good, *mon capitaine*," cried the brigadier. "We must retreat."

'"Give me your carbine," I said hastily.

'The brass blunderbuss shone brightly in the sun and made a good target. Though I fired straight up at the fellow I missed him, but by a piece of luck I saw a twig quiver a good two metres immediately beneath him. Again I fired, this time aiming into space, but two metres or more above him, just as he happened to be raising his weapon to his shoulder. The bullet struck him fairly and squarely in the chest, and he threw up his arms, clutched a monk beside him, and both fell forward into a ridge beneath.

'"Never mind them," I cried amidst the exclamations of the men at my successful shot; "fire higher and settle the two." But these latter did not give us the chance, as they quickly got behind a boulder.

'Thus left in peace, we turned our attention to those who were wounded, but luckily their injuries were of a trivial character; and then we examined the carriage. This was past any repair. I was taking the clock out, with the intention of putting it in one of the wagons, when in our rear we heard a trumpet; and coming towards us at a fast trot I saw some twenty of our dragoons, escorting five carriages, and I sent one of the men to meet them.

'"Who is it?" I cried to the man as he returned.

'"A Mons. Moyart," he replied.

'I had expected, on seeing such an escort, some general of importance, and was consequently mystified. However, the next moment a tall, thin, gray-haired gentleman with rather a Jewish type of face and a very suave manner got out of the carriage.

'"I knew you were in front, sir," he said; "we were only just in time."

'"Your arrival, sir," I replied, "was certainly lucky on account of the breakdown of my carriage; otherwise I don't think we had much to fear."

'In the politest manner he insisted on my sharing his carriage (a very fine travelling-berline) with him, even sending out his secretary, though there would have been plenty of room for him.

'Before starting for Russia the Emperor had issued very stringent orders against looting. In some few instances these orders were carried out; but the marshals and those in high command, knowing the Emperor was hundreds of leagues away, practically ignored them, and after a time so did every one else. This Moyart, who started life as a lawyer, had, it appeared, been sent by the Emperor, at the suggestion of the authorities of the Louvre—for he was a very fine judge of pictures and bric-à-brac—to report what was going on; just as Mons. Quiter had been previously sent, at the request of Kellerman, to sort and arrange the Spanish archives at Simancas. He was armed with all the powers of a provost-marshal, and could seize for the benefit of the nation all articles that had been looted. However, he had only got five carriages full; for, as all, from the marshals downwards, were tarred with the same brush, every impediment had been put in his way.

'So I very naturally, knowing nothing of the man then, and not knowing for what purpose he had gone to Spain, gladly accepted his kind offer. Carefully wrapping my clock in a cloak—for it was going—I set it on the seat, little thinking of the innocent way I was falling into another trap that, at the abbot's instigation, the plausible rogue was setting for me. When we arrived late in the evening at Irun his escort returned to Spain; and we, after a good meal about ten, started for Bayonne. Hitherto he had

been very taciturn, but the wine and the good meal he had had made him talkative.

'On the surface I could not have wanted a pleasanter companion. He was well read and had come across many celebrated men, especially artists and men of letters. He complained bitterly of the task he had been set, saying he had made more enemies in the last few weeks than he had made all his life; and then it was that I learnt his mission. I thought I should have sunk through the seat, for right in front of us was my clock, and armed as he was with the powers of a provost-marshal, I saw at once I was completely at his mercy. If he chose to help himself to my clock (if he only found out I had got one), nothing I could do would prevent him. In spite of the cloak thrown over it, I heard its soft, sweet tones striking the hours. Luckily, however, Moyart was deaf—so deaf that one found it somewhat fatiguing to keep up a continued conversation with him—so that he did not hear it; but for all that I was now thoroughly alarmed, and racked my brains thinking what plausible excuse I could make for continuing the journey by myself. However, for the time being, the great thing was to make myself as agreeable to the man as I could, and in this I venture to think I succeeded, though I should have liked to wring his neck if I had dared.

'Night came at length, and we drew the blinds and settled ourselves down to sleep. On the score of its being hot and close, I took off my coat and put it over the clock as an additional measure to stifle the chimes. It was some time ere I fell asleep. Just as the dawn was breaking the carriage stopped, and this woke both of us up.

'"Where are we?" asked Moyart.

'I looked out to see. It was a beautiful autumn morning. The mists were rising in the valley and the first pink rays of the rising sun just showing on the crest of the purple mountains. Suddenly my clock slowly and distinctly struck six, for somehow the jolting of the carriage must have moved the coverings.

'"*Mon dieu*," said my companion, with his hand to his ear, "what lovely bells!"

'For a moment I was too horrified to speak. "Yes," I replied, getting between him and the clock; "it must be the bells of the village church."

'"Well, I don't see any church," he said, pulling up the blind on his side.

'"Perchance, then," I continued, at the same time stuffing the cloak once more over the clock as the old man was looking out of the window, "it is some distant monastery, and the holy brethren are going to compline or something of that sort."

'"Compline?" he repeated. "More likely to a fine breakfast. Anyway, compline is not at this time of day."

'I saw I had made a mistake, but I was so flustered that I do not know exactly what I said.

'Fresh horses were soon put in, we drew the blinds again, and my companion was soon off to sleep once more. I was not going to run the risk of his hearing those chimes again; at any cost that must be stopped. It was a serious matter to me. I had been in Spain for three years, and this was the only reward I had got, and, come what might, I meant to keep it. I sat up and listened intently. Yes, the collector was asleep; there was no doubt about that; so I carefully took off the wraps from the clock and turned it round preparatory to taking off the pendulum, so as to stop it altogether. I should have liked to draw up the blinds, only I feared it would wake him. I was feeling about in the dark for the confounded pendulum when suddenly there was no end of a noise, enough to take the roof off; and, what is more, it kept on, for I had actually turned on the alarm. It seemed as though the Evil One himself was in the thing. I thought it would never leave off.

'"*Sacré bleu*," shouted Moyart, for we could hardly hear ourselves speak, "what on earth have you got there?"

'Concealment was no longer possible.

'"Well, the fact of it is, sir," I replied in apologetic tones when the din had ceased, "it's a very valuable clock. You must clearly understand that it does not belong to me; and I am only taking care of it. It is for a very dear friend that I am doing this."

'"Oh, are you?" he said dryly. "Well, just pull up the blinds and let's have a look at it. *Ma foi*," he continued with conviction, as he gazed at the beautiful article in deep admiration, "that is a beauty! There's one other like it, and only one, and that now belongs to M. le Duc de Choiseul. Yes," he continued, examining it critically, "and what's more, it's an historical clock."

'"The deuce it is!" I said to myself, thinking he meant to make that an excuse to take it. "You don't mean it, sir?" I said in awe-struck tones.

'"Oh yes," he replied. "Observe that lace-work * at the base of *fleur de lys*, which is only found on articles belonging to the king; and look at the exquisite modelling of that Venus and Cupid, and the whole *tout ensemble*. I will tell you the history of that clock. The two clocks were made by Osmond, to the order of Louis Quinze, and given by him to Louis the Dauphin (you see the dolphins are introduced in the ornamentation) before the latter's marriage to the Infanta in 1746. It is very rare for a clock of that size to mark the days of the month. The Dauphin, among other presents, sent that one to his *fiancée* at Madrid, and kept the other for himself, telling her how they could mutually mark off the days till the auspicious day of their wedding arrived."

'Of course I pretended to be very much interested in all this, and flattered him and told him how

* There is a fine specimen of this lace-work and dolphins on two Louis Quinze candlesticks which belonged to Louis the Dauphin, in the Wallace Collection, Gallery XX. Case A.

much I was impressed by his great historical knowledge. I fully expected that he would claim my clock at once, but he only leant back in deep thought, and, to my surprise, said nothing more. Of course I was on tenter-hooks all the time. I did not know what I could say or do, when Fortune (as I thought at the time) suddenly came to my aid, for the horses just then slackened their pace, and, looking out, I saw the rear-guard of a regiment of the line just in front of us.

'"What is your number?" I asked.

'"The Fifty-seventh."

'In a moment I saw my chance, for I knew slightly—but that did not matter—a fellow named Bercy in that regiment, so I asked about him, and was told that he was with the advance-guard. Anxiously, as we passed the regiment, I looked out for Bercy. He naturally was as much surprised to see me as I had been to hear of him, and I shouted out that I would see him farther on. Then I explained to my companion what a dear friend Bercy was, and how lucky I was to come across him, as I had very important news to tell him. A peculiar smile came over Moyart's face, but in a genial tone he said I should very soon have the chance of seeing my dear friend, as we were coming to a very decent inn, where we should get a vastly superior meal to any that could be had at an *auberge* in Bayonne.

'In his own estimation Moyart was a great judge of cookery. The landlord of this inn, he informed me, could make an omelette *aux truffles* quite up to any that might be got at "Les Trois Provençaux," and the trout too was excellent.

'"This Spanish war," he continued, "must have made his fortune;" and, to my unbounded delight, I thought he had forgotten all about my clock, for the rest of the short intervening space was spent in praising the merits of this wonderful innkeeper of "L'Écu d'Or," and comparing his efforts with those of various *chefs* of famous Parisian restaurants.

'Meanwhile I had quickly made up my mind, once we alighted, to continue the journey alone or attach myself to the Fifty-seventh, but I kept that to myself.

'Carefully taking up my treasured article, I followed Moyart into the inn, and while he was ordering *déjeuner* I saw the innkeeper's wife. I told her I would pay her well if she would take care of it; accordingly she promised to put it in her own room, and took the clock upstairs. Far down the road I saw the dust above the marching regiment. Leaving word that I would be back soon, I set off to meet it. Then for the first time—for I was still an invalid, and had not thrown off the effects of the typhoid—I found out how weak I was. I ought, of course, to have gone back at once to the inn, but I walked on slowly, and at last met Bercy, and told him how I was placed.

'"Oh, that will be all right," he said. "I will see the colonel; anyway, when we reach Bayonne you can get a good carriage."

'I certainly could not have been away from "L'Écu d'Or" more than twenty minutes, and I took it for granted that Moyart would be an hour over the wonderful meal he was going to order. Judge, then, my horror when I saw, while I was but two hundred metres from the inn, the confounded thief and his secretary hastily getting into his berline, followed by the landlord carrying a bundle. The door was banged and the vehicle disappeared in a cloud of dust. A horrible foreboding came over me. Of course I could not be sure, but instinct told me that he had got my clock.

'In a hastily scribbled note from Moyart I read: "I have taken quite a fancy to the clock, and, as it does not belong to you, I may as well take care of it for you."

'My very words to the abbot on the previous day.

'But I don't want to dwell upon that. A spasm of rage shot through me; I was speechless with anger. There are some memories in life that one does not care to talk of or even think about—the flight of Moyart with my clock is one; but one thing I do know, and that is, that swearing, not of a loud or vulgar nature, but the deep internal variety, was the only thing that gave me, for many a long day, any real relief.

*(To be continued.)*

---

# THE LIMIT.

By T. C. Bridges.

THAT the properly trained athlete can endure far greater and more lengthy physical strain than the ordinary man is self-evident. But man is not a machine, and there are limits beyond which it is not only unwise but extremely dangerous to go. The wise man recognises these limits, and, keeping within them, enjoys health and strength to the end of his days; the foolish—alas that there should be so many athletic fools!—attempt too much, and the penalty that outraged nature exacts is a heavy one.

Every winter there are two six-day go-as-you-please races at Madison Square Garden in New York, one for cyclists, the other for pedestrians. The former is for international teams, and the winners usually cover about two thousand seven hundred miles in the time. They actually keep up an average speed of nearly nineteen miles an hour for one hundred and forty-four hours in succession. In other words, the winning team could race a liner like the *Umbria* from Queenstown to New York, and almost beat her.

Does any sane person imagine that a human

being exists who can endure such a prolonged and terrible strain without suffering for it to the end of his life. Listen to what a spectator says of the finish in one of these races: 'Seven teams retired during the contest, and several riders are in hospital suffering from severe injuries caused by falling from their bicycles and other accidents. Nearly all the survivors presented a pitiable appearance from utter exhaustion and lack of sleep. Their faces were yellow and sunken, and their eyes bloodshot.'

This sounds sufficiently horrible, but the results of the six-day pedestrian contests are even worse. Out of forty-two teams who entered in a recent contest only fifteen were on the track at the finish. The scene on the last evening was a pitiable one, the men staggering along in a semi-conscious condition. Haggard, leg-worn, and half-blind, they struggled on, their trainers driving them as if they were a pack of dogs. Some had actually lost a stone and a half in weight during the six days. The winners, who had covered seven hundred and seventy miles, received prizes equivalent to a thousand pounds; but—and this seems the most repulsive part of the whole business—they had spent nearly two hundred pounds in food and drugs to keep them up.

Some readers will say at once, 'But this was in America. We don't do that kind of thing in this country.' Unfortunately we cannot afford to smile superiorly, and assert that Britons recognise the limit and remain within it; and instances in plenty can be adduced to prove this assertion.

About three years ago a Bolton man undertook the extraordinary feat of walking two thousand five hundred miles in one thousand one hundred hours. The conditions were that he should cover two and a quarter miles every consecutive hour, with one hundred hours' allowance for intervals. The track was round a public bowling-green, and the task was performed in the middle of winter. The weather was very severe, and the unfortunate man suffered fearfully in consequence. He became so weary that when he slept attendants had to thrust needles into his flesh to awake him, and on the last day was so weak that several times he was actually blown down by the strong wind. The account of his performance ends with the statement that 'he finished the last two and a quarter miles in a state of semi-consciousness, and was loudly cheered by a large crowd.'

You notice that you will always find a crowd to cheer performances of this kind. There is something essentially cruel about a crowd, even though its members may be individually humane; and the cruelty of the crowd is one factor which causes men to undertake feats which may almost be described as superhuman, and which certainly cannot be counted under the head of legitimate sport.

It is very doubtful, indeed, whether any pedestrian feats of this description can be called sporting. That those who undertake them and carry them through have any amount of grit and pluck is not to be doubted for a moment; but is there anything edifying in watching a man tramping round and round a track, hour after hour, day after day, battling against intense weakness and his natural longing for sleep? Certainly, when it comes to pricking him awake with needles or dosing him with drugs the verdict is beyond doubt. It is not sport but sheer brutality. No one has ever suggested that 'doping' a racehorse is the act of a sportsman. Shall we, then, permit a wider license in the treatment of the human athlete?

Speaking of horses, it may be safely asserted that there is nothing unsportsman-like in matching a number of trained thoroughbreds to gallop against one another over any ordinary distance. But those long-distance rides which have become popular on the Continent of late years come under a very different heading.

The most notorious of these performances was the Brussels-Ostend military ride. Seventeen of the horses died either during the race or within twenty-four hours afterwards, and four or five more had to be shot as useless. In spite of the popular outcry, this was followed a couple of years later by a French cavalry ride from Paris to Deauville. The fifty miles was covered by the winner in four hours, fourteen minutes, forty-five seconds, and this in blazing August weather. We are told that one lieutenant tried to gallop all the way, and when his horse fell going up a hill he injected ether to revive it. The poor brute struggled on again, and finished the race, then dropped, and was carried to a stable, where it died. Another horse also died in its stable immediately after finishing the race.

The Austro-German race from Berlin to Vienna was even more brutal. Of the seventy-two Germans who came in every one brought in his horse in such a condition that, if even it had not to be shot at once, its utility was at an end. The distance by the nearest road is three hundred and sixty-one miles, and that the winner accomplished the journey in eighty-five hours is a testimony to the amazing endurance of man's best friend, and to the callous brutality of its rider. How very different from the famous feat of Squire Osbaldestone, who in 1831 rode two hundred miles in ten hours! He changed horses every four miles, using sixteen horses for the task; and, being himself in thorough training, he was none the worse for his amazing gallop.

Few shows are more popular on the music-hall stage than exhibitions of extraordinary muscular power. Man is always morbidly interested in seeing how much his brother-man can endure without breaking a blood-vessel or otherwise collapsing. But are these things sport in any true meaning of the word? Does not the heart of the exhibition strong man suffer? Are not his arteries enlarged? Is he not laying up for himself all kinds of trouble in the years to come, and probably shortening his life? But this question of perilous public performances is a very wide one, too much so to be treated here. Looping the loop, high diving into shallow tanks,

parachuting from enormous heights, jumping in and out of barrels blindfolded—these and scores more of similar feats attract a public that has no true sporting taste, but goes to watch them merely in order to tickle a jaded appetite with the chance of a horrible fatality. Almost without exception, these sensational feats lie quite outside the sphere of true sport.

The holiday season will soon be with us again, and we are certain to read the usual harrowing list of accidents by cliff and mountain, river and sea. A very large proportion of these fatalities are caused by persons undertaking tasks for which they are physically unfit. For a man in hard training, who possesses a steady head, and is properly dressed and equipped, to climb a snow-clad peak is a thoroughly sporting feat. For another, fresh from an office-stool, unaccustomed to great heights, and imperfectly equipped, to attempt a similar climb is madness, frequently amounting to sheer suicide.

The Alpine accident list for one recent year shows that there were seventy-five fatal accidents and three hundred and fifty others, the death-roll of quite a respectable battle. Among all the killed and injured less than 5 per cent. were people who might with any justice be termed mountaineers.

Here is a typical example of the fashion in which lives are cast away in the Alps. In July 1907 two middle-aged ladies, together with three girl-friends, started up the Birnlucke, in the Tyrolese Alps. Though the mountain is eight thousand feet high, they were dressed in light summer frocks and high-heeled shoes, carried parasols, and took only one guide. Half-way up, clouds rolled across the sky, and the guide begged them to return. But they only laughed, and presently three men-friends joined them, and they continued the climb. Near the top a sudden, furious snowstorm burst, and very soon they were over their knees in snow. The cold was intense; the wind howled with blizzard force. Soon all five of the women were exhausted. The men had to drag and carry them through the drifts to the shelter of an overhanging rock; and, leaving one of their number to guard the rest, they hurried down to the half-way hut for food and blankets. Before they could get back the two elder ladies were dead, and the three girls very nearly so. Every one of the party, including the guide, was badly frost-bitten.

Such cases, though not all entailing like terribly tragic results, might be cited by the score. A young Englishman started up Pilatus in thin summer shoes. Not unnaturally he slipped on a grassy slope and rolled a long way, catching up on the sheer brink of a two-hundred-foot precipice. Another, attempting to cross the Mer-de-Glace above Chamonix in cycling-shoes, fell into a crevasse, from which he was rescued with much difficulty, half-frozen but still alive. A husband and wife, reaching the head of a steep *couloir* above St Gervais les Bains, were mad enough to start sliding down the steep, smooth rocks, as 'the easiest way back to the village.' Once started, they could not stop. The poor lady was smashed to pieces, almost every bone in her body being broken; the man was desperately injured.

Similar amazing rashness is constantly seen in this country. Not long ago a visitor to Dover attempted to scale the cliffs at a point where they are three hundred feet high. He got half-way up, and found he could neither advance nor return. It was hours before a rope-ladder was lowered, and he was rescued with very great difficulty from the dangerous dilemma in which his own foolish daring had placed him.

A crazy ambition to break records is responsible for many foolhardy exploits. Even a really great athlete such as Captain Webb lost his life in an attempt to do what no one had ever done before—namely, to swim the Niagara Rapids. Yet his fate has not deterred others from attempting the impossible. Four years ago Jack Glenister, an American swimmer of some repute, announced that he would venture through the Whirlpool Rapids. He had no sooner entered the water than he was whirled helplessly away in the furious current. Over and over again he disappeared from view, and the spectators who watched him as he was hurled against the rocks never expected to see him alive again. However, he was rescued a mile lower down, and pulled out, battered, bleeding, and delirious. It was days before he recovered his senses after his awful experience.

The border-line between legitimate sport and foolhardiness is not, after all, especially difficult to define. Every person must have a pretty good notion of what he can accomplish without actually injuring himself, and beyond that limit no one has any right to go. The honest ambition to excel in any form of athletics or sport is altogether admirable; the mere desire to win a wager or to perform a feat so dangerous that it has never before been accomplished is a foolish flying in the face of Providence.

# LAURISTONS.

By JOHN OXENHAM,
Author of *Barbe of Grand Bayou, Giant Circumstance, John of Gerisau, Great-Heart Gillian*, &c.

## CHAPTER XXI.—HOW SIR CHARLES TROD THE SHADOWY WAY.

MR PENNEFEATHER was at Grosvenor Place as soon as the news reached him.

'I am shocked beyond measure, Sir Charles,' was his greeting. 'I was with Sir George yesterday morning by his special request, and he seemed much as usual, and very determined to have this matter of Miss Lauriston's settled with proper regard to her safety, in which I fully agreed with him.'

'What matter is that, Mr Pennefeather? I have not heard about it yet. I was at Ealing on Saturday, and my sister has been so overcome that I have hardly seen her.'

'Ah, you had not heard? It was settled, I imagine, on Friday night, and she spoke to Sir George on Saturday, after you left town probably. She is going to marry M. de Montessonne'——

And, instantly and instinctively, Charles brought the matter to the touchstone of the new and perilous circumstances in which he stood. Charlotte's fortune must stand at considerably over one hundred and fifty thousand pounds. If her marriage entailed the payment of it, it meant disaster. This in a flash. Mr Pennefeather's next words, however, dissipated his fears for the moment.

'Sir George was giving me directions as to the settlement of her money strictly on herself. He spoke very freely to me, as he was in the habit of doing, and I think I had his full mind on the subject. I will submit a draft scheme to you within a day or two, and I suggest that in your sister's interests you insist upon its being carried out in its entirety. Otherwise, the Marquis may play ducks and drakes with her money—for political purposes, I mean; I suggest nothing else. I believe him to be a most honourable gentleman in every way. But undoubtedly this marriage will be a great thing for him in his present circumstances, and we must see to it that your sister is properly secured.'

'Undoubtedly.'

'Sir George's will is in my hands also. It is very short. He leaves everything to you, with but one stipulation, Miss Lauriston being already amply provided for by her mother's estate.'

'And the stipulation?'

'That if at any time you, of your own free-will, cease to take an active share in the management of the bank, your interest therein, as derived from him, is to be devoted to the foundation and maintenance of an asylum for idiots.' And Mr Pennefeather smiled gravely as he said it.

'I am afraid he had the fear that I would throw over the bank and go back to the army,' said Charles quietly. 'But I have no such intention. Lauristons must of course have a Lauriston at the helm.'

'Of course. Poets, they say, are born, not made; and without a doubt Lauristons are born bankers. And the helm could not be in safer hands than your own, my dear Sir Charles. You will command all the confidence which your esteemed father always enjoyed. And if he had the advantage of experience, you have all the advantages of youth; and for experience you will have the benefit of John Sax. I have a very great respect for John Sax.'

'He is a man among ten thousand. He will be invaluable to me.'

'You and he are sole executors, by the way,' said the solicitor, with a nod of approval. 'So you will have everything in your own hands. My own relations with you, Sir Charles, will, I hope, be as intimate and friendly as they were with your father.'

'I trust so, Mr Pennefeather. Where my father bestowed his confidence I am quite sure I may do so.'

Mr Pennefeather went his way satisfied as to the security of his position, and Charles went upstairs to find his sister.

It was characteristic of her that, when she came to him in the little morning-room which his wife as a rule made use of when she was in town, her eyes were swollen with much weeping, and her face puffed almost beyond recognition. Yet between her and her father there had never been any very great affection or even cordiality. Her fads and fancies and affectations had irritated Sir George to the point of brusqueness with her at times, and he was always happier in his mind and temper when she was out of the house.

'Oh Charles!' she sobbed with a fresh outburst, 'I really cannot believe it yet. Yesterday at this time he was as well as you or I, and now'——

'He is at rest, Charlotte, and undue grief will benefit neither you nor him.'

'No, no! But yet, oh, how dreadful it is, and how little one knows! In the midst of life we are in death, and any moment may be our last! How terribly true it is! I have not slept all night, not one single wink; and Honeybun has been trying to make me eat, but I could not take a bite—just a dish of tea and not another thing. We must just have faith, I suppose; for what else is there, you know?' and she ravelled off at last in a forlorn sigh.

Charles had made no attempt to stop her till she was run down. He had long since learnt the wisdom of that.

'I came,' he said when she had finished, 'to speak with you of M. de Montessonne.'

'Ah yes! The poor Etienne! He will have to wait a time now, I suppose. We could hardly get married immediately;' and she looked doubtfully across at him.

'As your own good sense tells you, hardly immediately, with any decency. But the delay need not be a very extended one. Our father, I think, indicated his views as to your settlements.'

'Oh yes; and I am sure he was quite right, and very thoughtful for me. You see, Etienne cannot deny that he is a very faithful Bourbonist. Has he not proved it by spending on them every sou he saved? And I certainly would not wish my money thrown after his, and all to no purpose.'

'That is, I think, the wise view to take, and Mr Pennefeather is preparing the necessary documents. All I wished to say in the matter was this. You have not yet discussed it with M. de Montessonne, I presume.'

'Oh, my dear, what chance have I had? He came yesterday afternoon; but when he heard he went away again, of course.'

'Quite so. Well, it is just possible the marquis may not see things quite from our point of view. It is indeed likely, and one could not blame him perhaps. All the same, in your own interests, you must be firm, and our views must prevail. You quite understand?'

'Oh, quite! Father made it quite plain to me. He said that as Marquise de Montessonne, with my fortune behind me, I should be somebody. But the wife of a marquis who teaches French for a living would be nobody.'

'That is the position exactly, if only you will not permit yourself to be persuaded out of it.'

'I will not, I assure you, Charles. I know it is for my good. I can really be very firm when occasion calls for it.'

'If you are not firm in this matter you will probably have little occasion for it in future.'

'I quite understand.'

And Charles went away fairly well satisfied that she would carry her point, for he knew of old that she could be as obstinate as a mule when she chose, and especially where her own convenience or interests were concerned.

Then he sent off a groom with a letter breaking the news to his wife, begging her not to think of coming in to town, and promising to come out to them the following Saturday.

For the first time in his life he found relief in the thought that some days must elapse before he saw those who were dearer to him than his own life, and his face quivered and his teeth clenched over it. It was the first chill touch of the shadowy way in which he had deliberately set his feet.

### CHAPTER XXII.—HOW ALL THE WORLD TURNED OUT TO HONOUR SIR GEORGE.

SIR GEORGE'S funeral was the occasion of unusual pomp and magnificence, not so much in itself as in the quite extraordinary display of ceremonious grief it called forth from almost every stable in the West End, and in many cases from the owners of the stables as well.

Charles would have wished it otherwise, but that could not be. There were so many among the great and wealthy who desired to show their respect and gratitude to the great banker—many, indeed, with ample cause, and many again perhaps not entirely without provident thought for the future.

The Prince of Wales conveyed his condolences and intimated his intention of sending a carriage to join the procession, and the rest of the world followed suit.

The Lord Mayor's carriage outvied the Prince's in splendour, his coachman and footmen, from powdered heads to bulging calves, exhaling such a sense of opulence as they passed as to call forth loud and admiring comment from the crowds.

There were in addition two royal dukes, four ordinary dukes, five marquises, six earls, three viscounts, one bishop, and barons, baronets, and knights—or their carriages—too numerous to mention, and not by any means in their rightful order of precedence, except in the case of the Prince's equipage and the Lord Mayor's. The rest fell in just as they happened to arrive and managed to get into line, with volcanic outflow of language anything but becoming to the occasion, and otherwise as little damage as might be.

Mr Pitt was there in person, bearing his heavy burdens with serenity, and heedless of the scowls that greeted him; and Mr Fox; and his one-time friend Edmund Burke, come over from Beaconsfield on purpose, and with little thought that he would himself be figuring as principal in an equally lugubrious procession two months later; and the Speaker of the House was there, and Mr Windham, and ever so many more—all testifying before all the world to the high esteem and confidence in which the great banker was held.

The Marquis de Montessonne made a very brave show, in a handsome hired coach which cost him many weeks' fees; but under forthcoming circumstances he judged it money not ill spent.

In all, Miss Lauriston, from her darkened window, counted over one hundred and fifty carriages, and was not a little uplifted in spirit, and even somewhat mitigated in her grief, thereby.

And the crowd revelled in the show of horseflesh and coroneted panels, and scowled at Mr Pitt, and audibly wished itself in the shoes of the dead man's son.

And the dead man's son looked out upon them

with a quiet face and wished he had died on Dunkirk sands.

John Sax and he rode together in the first coach—driven by Jerry MacClootie, who had come over from Ealing for the purpose—and tried to avoid one another's eyes. For Charles felt that if their eyes should chance to meet, with all their hidden knowledge of the hideous actual facts in them, he for one must break into hysterical laughter, so monstrously incongruous was the whole hollow show. He was overwrought, you see, and no wonder.

'My God! My God! John Sax!' he said through clenched teeth. 'Suppose they knew! Suppose they knew!'

'And that, please God, they never will!' said John Sax steadfastly.

---

### CHAPTER XXIII.—HOW THE FETTERS BIT.

THERE was no break in the even tenor of business matters at the bank.

Sir George was gone. Sir Charles ruled in his stead, sat in his chair in his private sanctum, and gripped the reins with a firm hand and a face set inflexibly to the necessities of the case. Under John Sax's direction, and with his assistance, he did what had to be done.

What direful deeds and what heart-breaking emotion may lie behind a few simple words!

Charles Lauriston did what had to be done! And he slept little of a night during that week, but lay through the grim, black hours staring starkly into the black void above him, thankful for the restful darkness which allowed him to drop the mask and agonise unseen. And when at times Nature insisted, and he fell into short, troubled sleeps, he dreamt that the great mahogany bedposts were the beams of the gallows, and woke striving to tear the rope from his neck.

Not lightly, nor without suffering, did he enter on the shadowy road, and John Sax looked anxiously at Sir Charles's set white face each morning with a cold dread at his heart lest he should break down utterly and land them on the rocks. For he himself had been through it all, and he understood to the full the wrench and the heart-break and the self-derogation, until one's better self had been elbowed aside, and the new, lower self grew case-hardened and dulled to the higher and sweeter things of life, and by degrees accommodated itself to the galling load and the bite of the fetter.

'It is telling on you, Sir Charles,' said John Sax with concern in the privacy of the sanctum one morning.

'Yes, John,' with the weariness of the black, sleepless hours in his eyes. 'One does not part company with all that is good and sweet in life without feeling it.'

'Try more exercise, sir. I used to walk ten miles every morning before coming to the bank. It did me a world of good.'

And next morning Charles had out the Devil before the world was astir, and left him no grounds for complaint of lack of exercise before he had done with him.

A black, black week!—the blackest week of his life!—and it left its mark upon him for ever.

The sudden jerk into supreme power, with the immense responsibilities entailed thereby, would have sufficed to age any man. And here, behind and beyond all that, was the menace and the shadow and the grim black fact. No wonder he showed it.

To all with whom he came into contact, however, his bearing was gracious and courteous as ever; and as to the gravity and repression of his looks, the suddenness of Sir George's death was sufficient to account for that.

But when Saturday came, and he was free to join his wife and children, for the first time in his life he found himself dreading the ordeal. Would Mary's spiritual insight pierce his mask and read the torture of his soul? He feared it. He feared it greatly. For the first time in his life the thought of meeting her clear, calm eyes troubled him. Could he bear himself before them as he had done when his soul was white and his hands were clean! He doubted it.

To soothe his jangled nerves he galloped away along the Edgeware Road, and never drew rein till he reached Edgeware itself. Then he turned to the west and rode through Stanmore and Harrow Weald to Harrow, and so came down on Ealing from the north. And as he sped past Harrow Hill his eye fell on Mother Goose's cherry-grounds, and Mavie's urgent voice rang in his ear again: 'Oh daddie, I'd sooner have you a tinker than a thief!' And his face dyed crimson as he urged the Devil on his way.

And so when he galloped up the drive of the Red House his face was somewhat less like an ivory carving, and he had braced himself to meet their innocent comments with something approaching composure.

*(To be continued.)*

# NORFOLK ISLAND AND ITS PEOPLE.

## THE DESCENDANTS OF THE 'BOUNTY' MUTINEERS.

SITUATED in latitude twenty-nine degrees three minutes south longitude, one hundred and sixty-eight degrees east, with an area of ten square miles, Norfolk Island was discovered by Captain Cook in 1774. The name brings to the mind of most people mental pictures of its convict associations rather than its connection with the romantic story of the *Bounty* mutiny. It is six miles long, and three miles at its widest part, and therefore in every way more suitable for the development of the Pitcairn Islanders than was their own beloved 'Rock in the West,' as they so aptly termed it. As the population increased Pitcairn Island was found to be too small, so in 1855 the British Government decided to offer them Norfolk Island, just then about to be abandoned as a convict station. This offer was accepted by the Pitcairners, and they were landed at Norfolk Island on the 8th of June 1856. The present population of Norfolk Island is nearly eight hundred.

The story of the good ship *Bounty* and the bold, bad mutineers, together with the many favourable accounts written of their descendants, had, whilst I was in my teens, caused within me a desire to see Norfolk Island. Many, many years elapsed before that wish was gratified. In those days, when the island was governed by the people, who elected their own magistrates and councillors (the Chief Magistrate being in authority), no strangers were permitted to make a home there except under very exceptional circumstances. I had become acquainted with Mr Byron Adams, the then Chief Magistrate, who was on a visit to Sydney, New South Wales, and I besought his influence to get permission from the islanders to settle there. On his return a public meeting was held; and, as I had no intention of starting business on the island, my request was granted. I therefore booked my passage by a small schooner trading between Sydney and Norfolk Island, and awaited her arrival in port. She was delayed for three weeks, having been sheltering at Lord Howe Island from the winter storms. Finally, one spring morning we set sail, and everything gave promise of a fair-weather trip.

It was Sunday morning, and the cry of 'Land ho!' sounded through the boat. We were instantly on the alert, and then began the usual struggle for personal belongings and *et ceteras* which is characteristic of the weaker sex at such times. At last we were ready, everything having been squeezed into the smallest possible compass; and, well wrapped up and ready for landing, we emerged from our cabin. What a pretty scene the island presented! The hills were crowned with verdure that looked like coverings of bright-green plush intersected with pale-red ribbon, the terra-cotta coloured roads which wind in and out of the hills conveying that effect to the eye. We appeared to sail nearly all round the island, the various beauty-spots being pointed out to us as we passed them. On nearing the landing-place the captain seemed rather vexed that no preparation had been made to meet us. We saw one or two men on shore, but it was all so calm and peaceful that one would hardly suppose the place was inhabited; then, coming to the conclusion that all the boats were at the Cascade, another landing-place, he proceeded to sail thither. There is no harbour, and the whaling-boats meet all vessels, taking off passengers and cargo—a very difficult matter when there is a rough sea. When near the Cascade we saw a great crowd on shore, and then two boats put off and came alongside. The occupants sprang aboard, and after the exchange of greetings and family news the men resumed their places in the boats. As the waves brought the big whaleboat to the vessel's side the captain took us, one after the other, and dropped us into the arms of the giant whaler below. The schooner's crew, in their 'Sunday best,' with the exception of some who were left on board to look after the vessel, got into the other boat. It took us a long time to reach the Cascade, the boat being anchored so far out. Our boat was brought alongside a natural pier (since destroyed by a violent storm), composed of immense boulders, which jutted out to sea for a considerable distance. The other boat having reached the pier first, the captain stood on a big rock and sang out to me as the boat came near, 'The next wave will bring her alongside. Be ready, and when I call out "Now!" give me your hand, and make a good spring for this rock.' I followed directions, and soon found myself standing beside him on the slippery rock. As the succeeding waves brought up the boat my companions were landed in like manner. After several hurried introductions to those immediately around us, we were driven away to our future home. What a lovely drive it was that bright spring day! Over the green hills, passing smiling valleys already showing evidence of the gardener's craft though it was still early in spring, then on over a long stretch of road level as a bowling-green. These roads are a pleasure to use, and are kept in order by virtue of one of the old island laws, which compels every male between the ages of sixteen and sixty to devote so many weeks' labour annually to their maintenance. On we drove, through Ferny Lane—a lovely avenue of tree-ferns—past the famous Pine Avenue, and thence to Hundred Acres. We were soon established in the cottage which, with kindly forethought, Mr Adams had rented

for our use. During our stay on the island that gentleman showed great kindness and courtesy. He it was to whom we constantly appealed when in difficulty, and he never failed us. I am afraid we were a source of trouble to that excellent man, who, a few months afterwards, met with a shocking death. In company with others he was out whaling, and, having captured a whale, the men were returning home. They had two boats, the one with the whale attached going first, the other (in which was the Chief Magistrate) being a considerable distance behind. Another whale, infuriated at losing its mate, rushed up, and, seeing this boat, attacked it savagely. It was capsized and smashed, and the occupants were cast into the water. Poor Adams was fatally injured. His companions took it in turn to hold him up *for six hours*. He implored them to leave him and save themselves, as he realised that he could not survive; but they would not leave him. The first boat's crew, seeing no sign of the others, returned to search for them. The injured man was landed and taken home, but soon succumbed to his terrible injuries. His coat was washed up on the beach next day. In him the Norfolkers lost their truest and most universally respected friend.

Our furniture arrived by very small degrees, for the carts are particularly small and the horses not strong, being entirely grass-fed. The hoofs of the latter are innocent of shoes, and grow to an abnormal extent. Poor patient brutes! they are more like donkeys than horses, for they take as much 'whip' as one cares to give them without being in the least disturbed.

For several days we were besieged with visitors, all anxious to see the 'strangers.' In those first few days everything seemed so strange — no baker, butcher, grocer, or milkman calling. On inquiry, we found that for beef—no mutton is obtainable, for there are very few sheep on the island—we should have to wait till some one was killing, and that happened only once every few weeks; and for bread—well, all baked their own. Almost everything that is consumed in the way of fruit, vegetables, grain, and meat is home-grown, bananas and *kumeras* (sweet potatoes) forming the staple food. Very little labour is required to till the soil, which is so rich and the climate so favourable that one can throw seeds almost anywhere and reap a bountiful harvest. All the men are accustomed to gardening, smith-work, &c., and many, through working on the boats, are good cooks.

We soon found that the Norfolkers have many good traits, but pre-eminent is their extreme good-nature. If one has anything more than his neighbours, they have but to ask to receive; and this applies not only to farming implements, but to furniture and household utensils, and even to wearing apparel. It is a matter for astonishment to a stranger to see one of the men hunting round the island from farm to farm to find out who has his coffee-mill or something else of a portable nature. Each borrower passes the article on in turn to the next one requiring it. If a boatload of fish is brought in, they are handed round to every one on the island, a supply being taken to any one unable to go to the boat.

Another admirable feature in the character of the men is that they have never been known to desert a distressed comrade. Some time previous to my arrival three men were out fishing, and, rough weather coming on, the boat was capsized and all the occupants thrown into the sea. One was unable to swim, so the other two held him up until assistance was rendered from the shore, *three hours later*. This act was the more praiseworthy in that the assisted man was not one of their own people.

The Norfolkers are splendid swimmers, being taught, in fact, almost from infancy. At eleven o'clock each forenoon the school children of all ages from three upwards are taken by their teachers to the beach, there to spend their playtime. And what fun they have swimming, diving, and splashing each other, laughing merrily the while! Happy youngsters! it does one good to watch them. I saw a little girl of eight go into the surf, climb a high rock, and throw herself backward into the sea, to reappear several yards away, her mother standing on the beach laughing. Some years ago two women went to Nepean Island, a mile from the mainland, to gather birds' eggs. Whilst busy at this their boat, being insecurely fastened, was carried unnoticed out to sea. Undismayed, they simply swam home.

Besides possessing these natatorial accomplishments, they are all good riders, men, women, and children being as much at home in the saddle as they are in the water. They are absolutely strangers to fear. The women-folk use men's saddles, putting the left foot in the stirrup on the left side and throwing the right stirrup over the saddle, thus making an improvised side-saddle. At the time of my visit there were but few side-saddles on the island, but nevertheless one is always to be found for a 'stranger.' A paper-chase on horseback is frequently indulged in; and accidents seldom occur, though the islanders appear to ride so recklessly.

Dancing is an amusement of which both young and old are extremely fond. I saw at one ball a great-grandmother taking part in a first set, and dancing more capably than many of the younger ones.

A Norfolk Island wedding is a function to be remembered, the catering for the dinner presenting novel features. Friends and relatives bring their quota of comestibles—some turkeys, others fowls, eggs, &c. Word is sent to two or three of the best cooks—and the island boasts not a few experts—to come and assist in the preparations. As a rule the dinner is held at the residence of the bride's parents, long tables being placed along the veranda, which is covered with flowers and shrubbery; and, as the average veranda is ten feet wide, there is ample room for the guests, who usually number upwards

of a hundred. The repast finished, a riding party is arranged, the bride and bridegroom being of the company; others of the guests enjoy music, tennis, and cards. After tea, dancing is indulged in till the 'wee sma' hours,' when the party breaks up.

Their method of conducting picnics seems very unorthodox to a stranger. I was invited to one held at Emily Bay, and on arriving there found a number of young girls laying long white tablecloths on the grass and unloading hampers. I remarked that none of the sterner sex were visible, and was told that the men were out in boats fishing and collecting sea-birds' eggs. Eventually the boats arrived well laden. All hands set to work, and in an incredibly short time the fish were cooked and a kerosene-tinful of birds' eggs boiled. These and other delicacies from the baskets were spread, including lemon-tarts, in the making of which they are experts. After dinner games were played by the children, some of whom took a trip to Nepean Island. On their return another tempting meal was partaken of, and all went home tired and strictly sober, for no intoxicants can be obtained on the island except when supplied by the doctor.

On the 8th June the anniversary of the landing of the Pitcairners on Norfolk Island is commemorated by an open-air feast. Every one on the island is expected to contribute edibles and attend, and strangers are made particularly welcome. Cricket is afterwards played—'Norfolk against the World'—and a grand ball given in the evening. *En passant*, it may be mentioned that concerts, picnics, and balls—fancy dress or masked—are free.

The ruins of the water-mill are still to be seen, and the surrounding vegetation is kept green by the waters of the mill-stream. The valleys through which it flows are very productive, growing oranges and bananas in profusion.

What is known as 'the town' (or more properly Kingstown) consists of a few scattered houses near Emily Bay. Many of them are commodious buildings, and were originally used as barracks, officers' quarters, &c. Being built of stone, the majority have bravely withstood the ravages of time, and are still habitable, notably the pretty cottage allotted in convict times to the Commandant, and in later days to the Chief Magistrate. The old barracks are now used as a courthouse and ballroom, and what was at one time the military stores, a large two-story building, is now the Anglican Church. Parts of the walls of the old prison—the scene of so much vice, tyrannical brutality, and helpless suffering, of which so much has been written by Price Warung, Marcus Clarke, and others—are still standing. At one time the Norfolkers carted away many loads of the fallen stone for building purposes; but the New South Wales Government stopped the practice, although the prison is fast crumbling to absolute decay. Surrounding some of the other buildings also was a high stone wall. Around the barracks, military stores, &c. a thick stone wall still stands, in which are loopholes where the guns were placed to command the prison-yard and adjacent beach in case the prisoners attempted to escape. Poor wretches! what chances of escape were there? Surrounded by the ocean as they were, and with no food available except guavas, starvation or surrender would not have been long delayed. Lemons and oranges were growing wild in the scrub-land; but in order that no sustenance should be afforded the fugitives, the orange-trees were destroyed and the lemons left.

What monuments of enforced industry these convicts left! They planted the pines in the avenue, the tree-ferns in Ferny Lane, and built bridges, houses, stone fences, and roads. At the rear of what used to be the Commandant's house is a high wall, extending for a considerable distance, built of sods, and having several archways. No amount of inquiry on my part could elicit any information regarding this. It is supposed to have been built either as an enclosure for cattle or for the purpose of providing work for the convicts.

Battle Bridge derived its name from a fight between a gang of convicts at work there and the officials in charge. In the *mêlée* one of the latter was thrown bodily over the bridge into the stream below. On the road leading from Longridge to town I was shown a spot at which, as some lady-visitors (wives and daughters of prominent men) were being shown over the island, the carriage was stopped where some convicts were working, and the horses taken from the shafts and the men harnessed to the carriage, to jog the gentle ladies round to view the sights, a little daughter of one of them clapping her hands and laughing at the 'funny men.' While thus engaged, the impromptu jinrikisha-men, smarting under the indignity, agreed to rush the vehicle over a cliff, and thus wreak vengeance on the occupants. Their plan was, however, frustrated through one turning informer. In the face of treatment such as this, can it be wondered at that rebellion smouldered, albeit hopelessly, all through the period of convict occupation?

When preparations were being made for the removal of the convicts, some of them begged hard to be allowed to remain, but they were all taken to New Norfolk, in Tasmania, the authorities believing that they would exert an evil influence over the simple-minded Pitcairners. Many animals were left for the use of the new arrivals, including horses, cattle, pigs, goats, and sheep. The younger men, on landing, regarded the horses curiously, never having seen the like before, but they were not long in putting their usefulness to the test. The goats have long since disappeared, the sheep have dwindled to insignificant numbers, and the quality of the other animals has deteriorated.

Ball's Bay, at the eastern corner of the island, is a wild, weird-looking place. The cliffs are high and almost perpendicular, and are covered almost to the water's edge with tangled creepers and shrubs. The bay runs back a considerable distance, and on calm days the waves are small and come in slowly with a

dirge-like *whis-sh*, eerie in the extreme. When the sea is too rough for outgoing passengers to use the boats at either Sydney Bay or the Cascade (which, however, occurs only at rare intervals), the cliffs at Ball's Bay must be descended. The timid sex on these occasions invariably become terrified; but it is usual for two stalwart men each to take an arm, and half-carry, half-drag them down to the boat. It is a hazardous journey, as one false step would probably cause the fall of the whole party into the waters below.

Sydney Bay is hardly worthy of the name, being merely a small indentation in the land. Here, when weather permits, passengers from the incoming vessels are landed at a strong wooden pier. There is nothing whatever to break the force of the waves. It once happened that the boat of a pleasure-party, comprising both sexes, was carried past the pier and round a point, where all on board were capsized, though fortunately no lives were lost. I have never heard of a Norfolker being drowned.

When the mail-bags are landed from the boat they are taken to a small building in 'the town,' and the mails sorted in a very primitive manner. The postmaster, standing in the middle of the room, empties the bags all around him, and the expectant residents stand near. As he stoops, picking up a letter or a parcel, he calls out the name thereon, and the individual steps forward and receives his mail. Should the name of an absent person be called, some one volunteers to deliver the letter. I was not aware of this custom, and on receiving my first letters felt vexed that they should pass through the hands of unofficial people before being delivered. I meekly inquired for the postman; but the bearer only laughed, and informed me that I was under an obligation, he having ridden two miles to deliver them to me.

All around this coast are visible the effects of the encroaching sea. In some places one can stand on the cliff, and, looking down, see grass and pine-trees growing far below, the piece of land supporting them having been torn out bodily and thrown down. The shape can be fitted in by the eye to the scalloped edges of the cliff. Elsewhere small bays have been formed, where nothing remains of the land but a mass of stones, which roll backwards and forwards in the surf. The sea is even encroaching on the cemetery, the lower part of which is under water at high-tide.

One of the finest sights of the island is the Pine Avenue, which runs in a perfectly straight line from Longridge to the Melanesian Mission. It was formerly a mile and a half in length, but a considerable portion of the avenue ran through the grounds of the mission, and much of this was cut down. Many of the trees outside the grounds have decayed, and have never been replaced. It seems to be no one's business to repair anything, which is to be deplored; for, as you stand at the Longridge end and look towards the mission, the view down the avenue is not easily forgotten.

This island is the home of the stately Norfolk Island pine, which grows here to an immense size, the very old trees occasionally measuring twelve feet in diameter. In former times they were ruthlessly destroyed, the Norfolkers, with an utter disregard of future requirements, cutting down several trees at once, and choosing the finest parts for building or other purposes, the remainder being left to decay. When it is considered that these magnificent trees take a hundred years to mature, and that the island is so small in extent, the folly of this waste is apparent. The New South Wales Government, however, on taking over the island, wisely imposed a charge for each tree cut down, whether used or not. During a thunderstorm it is not unusual to see several horsemen sheltering under one, and emerging therefrom perfectly dry.

The headquarters of the Melanesian Mission are situated at the south-western corner of the island, one thousand acres having been purchased from the Norfolkers in 1866. It has the appearance of a small village. The missionaries have comfortable cottages, smaller ones being provided for the married converts. The late Archdeacon Palmer very courteously showed me through St Barnabas Church and grounds. Their beautiful memorial chapel was built to perpetuate the memory of Bishop Patteson, and is solely for the use of the mission. Excepting at night, in Advent and Lent, the service is conducted in Mota, a simple polyglot language constructed by the missionaries to facilitate their labours; and this all the students have to learn. St Barnabas is a very handsome structure both inside and out. The floors are tiled; and the seats, arranged end-on to the altar, are beautifully inlaid with mother-of-pearl brought by the natives under training from their own islands. A native organist was playing at the time of my visit. Between two and three hundred of these natives are under instruction at the mission. They are brought here from the various islands by the mission steamer *Southern Cross*. Besides being taught Christianity, they are shown how to pick up the 'white man's burden' in the fields. If any amongst them show musical ability they are taught to sing and to play. The women prove apt pupils at housework, and are given small weekly allowances, which they invariably spend in purchasing perfumes. Both sexes adorn their otherwise bare heads with bright flowers on all occasions, the scarlet hibiscus being used by preference. Small ornamented sticks of bamboo are worn in the manner of ear-rings. The missionaries are very good to them, joining in games of cricket, &c. They are better fed and housed than many of their white brethren, and seem very happy. They cannot accustom themselves to sleeping in beds, but roll themselves in blankets on the floor. I was shown a baby born at the mission two days previously; its skin was of a piebald colour, and I was assured that the children are perfectly white when born. As an inducement to good conduct and to foster contentment, the natives are occasionally

given a day to themselves, which they spend in the bush in the ways of their forefathers, eating their food in the native style and refreshing sweet memory in a practical manner. When sufficient instruction has been imparted, the most intelligent are sent back as teachers to their homes to convert others by precept and example.

Nepean Island, a large, bare rock, is a mile from the coast. On it grows a solitary pine, stunted, blighted, and forlorn; but there is no sign of other vegetation. It is frequently visited by the women-folk for the purpose of collecting shells, as those found there are prettier than the shells on their own coast. When the weather can be depended upon it shares with Phillip Island popularity as a picnic resort.

Phillip Island is three miles from the mainland. Once covered with verdure, it is now barren and bare through some misguided person stocking it with rabbits, with apparent disregard to their fecundity. It is amazing how they manage to exist, for they have almost denuned the island of vegetation; though it is said their herbivorous instincts have been perverted to cannibalism in the fierce struggle to sustain life. Besides the rabbits, the only signs of animal life are the gannets, which resemble huge geese. A few pines still remain, their roots washed bare; but in a little while they will disappear like the others into the greedy maw of ocean. In one place a basalt precipice dips eight hundred feet sheer to the water below, the highest part of the island being one thousand and thirty feet above sea-level. Phillip Island was at one time frequently visited for rabbits and for birds' eggs. There is a tradition that in the days of the 'system' one unfortunate convict, goaded by cruelty, swam the three miles to Phillip Island. The alarm was raised, and a boat was quickly manned and went in pursuit. When the boat drew near, the convict, seeing that escape was hopeless, jumped in despair from the cliff into the ocean, and was never seen again. The sea-birds cluster here in immense numbers, and their eggs are brought to Norfolk Island in boatloads. Very nice and dainty they are, having a more delicate flavour than ordinary hens' eggs, and being prettily marked all over with dots and splashes. These birds also abound on Nepean Island, the eggs being so plentiful that one cannot walk without treading on them, the birds meanwhile circling overhead and uttering deafening screams.

After two years I tired of the quiet life, and longed to renew acquaintance with the bustle and strife of busy Sydney. The little schooner *Oscar Robinson* was about to sail for that port, so I sent my chattels on board, and was driven down to Sydney Bay, where the vessel lay at anchor. The captain met me and advised me not to go on board that night, as, the weather being unfavourable, he intended taking her round to the Cascade, where I could embark next day. He had been waiting several days for a fair wind. Next day was wet and squally; and early in the afternoon news flew over the island that the *Oscar Robinson* was wrecked, having been blown on to the rocks whilst an attempt was being made to take her to the Cascade. My belongings were brought ashore, unpacked, and hung out to dry. The schooner was sold for a few pounds to an islander, who made her stanch enough to be taken to Sydney for thorough repair. A whaleboat was then manned, and an effort made to tow her out; this failed, and further attempts were postponed till a 'moon tide.' When the tide was favourable they managed to get her out, and I once more took my passage, packed up my things, and was ready to start, when the Chief Magistrate sent word that he would not allow any women to sail in her, as he did not deem her safe. Once more I unpacked and waited; then, when another schooner called, and was leaving for Noumea, in New Caledonia, I decided to take passage by her and catch the M.M. steamer *Tanais* at Noumea for Sydney. For the third time I gathered my goods, when, to my dismay, the Chief Magistrate again declared I should not go, as the number of passengers had been exceeded. I likened myself to Bruce's spider; and when the mission steamer *Ysabel* called in, bound for Sydney, I again packed up—I was becoming an expert by this time—and was at last enabled to leave, six months having elapsed since my first attempt to take my departure.

## SOME EARLY POST-OFFICE REPORTS.

By R. S. Smyth.

HETHER, because of the extent to which the postal question had occupied the attention of the public for some years preceding the introduction of the 'penny-post' in 1840, it was not considered desirable to bring it prominently forward in the years immediately following, or whether it had not occurred to the several Postmasters-General who ruled in the interval that they should give an account of their stewardship, it would be difficult to say; but, from whatever cause, it was not until 1854 that the first report appeared. This report has been out of print for, I believe, very many years. The introductory paragraph, which refers to 'the Lords of the Treasury having sanctioned my proposal that an annual report should be made setting forth the progress, changes, and improvements effected in the Post-Office during each preceding year,' shows that the suggestion came from the Postmaster-General. The report for 1854, being the first, contained, as might be expected, a 'Historical

Summary;' but as the history of the Post-Office is now pretty generally known from the works of subsequent writers, only a brief reference to some of the less-known yet interesting facts mentioned in the summary need be made.

The conveyance of letters was at first only by personal friends and special messengers; then, in addition to these, by common carriers with pack-horses. But as under the peculiar system of the times horses were never changed during a journey, however long, but took whatever rest was necessary at the different stages, it can be readily understood that letters reached their destination very slowly. Subsequently these carriers were licensed, and it is on record that a number of them sent in a petition to the effect that 'certain haglers and others, unlicensed carriers, do presume to outgo the authorised pack-horses, and deliver their letters before the authorised wagons, carts, and pack-horses can arrive, which is contrary to the known laws of the realm.'*

A letter-post was not established by the Government till the reign of James I.; but then it was to foreign countries only, 'for the benefit of English merchants.' No inland post was established till 1635. In that year the Postmaster of England was commanded 'to settle a running post or two to run night and day between London and Edinburgh, to go thither and come back again in six days, and to take with them all such letters as shall be directed to any town on or near that road.' It was at the same time ordered that 'byposts' be connected with many places on the main line, 'to bring in and carry out the letters from Lincoln, Hull, and other towns.' Similar posts to Chester and Holyhead and to Exeter and Plymouth were decided on, and others were promised. The postage of letters varied from twopence to sixpence in England, according to distance, and to any place in Scotland eightpence. The conveyance of letters by persons other than 'those employed by the Postmaster' having been prohibited, great dissatisfaction was caused, as it was considered 'an unwarrantable stretch of the Royal prerogative;' but the prohibition remained. Originally the Postmaster was allowed to take the profits in consideration of his bearing the charges; but as the revenue increased the office of Postmaster was 'farmed,' and this practice of 'farming' was continued as regards the 'byposts' till the end of the eighteenth century. Cromwell and his Parliament made great changes, and the ordinance under which these were effected is candid enough to give as a motive for the further establishing of posts, 'that they will be the best means to discover and prevent many wicked designs against the Commonwealth.' How it was intended the 'discoveries' should be made may, I think, be readily supposed. As regards Scotland, although, as has been stated, a post between London and Edinburgh had been established, no provision was made for an internal post in that country, and it was not till 1695 that the Scottish Parliament passed an Act for the general establishment of a letter-post.

In 1683 a 'penny-post' for London and its suburbs was set up by Robert Murray, an upholsterer. It was, however, denounced by the ultra-Protestant party as a contrivance of the Jesuits, and it was alleged that 'if the bags were examined they would be found full of Popish plots.' Nevertheless the undertaking was continued for some years, and so successfully that the profits excited the envy of the Government, who seized it on the ground of its being an infringement on the Crown. It is interesting to know that a *halfpenny* (local) post was established, or at least attempted, in 1708; it was intended to be in opposition to the penny-post, but the enterprise was suppressed.

In a letter written by the late Mr F. J. Scudamore (of the Accountant-General's Department) which appears in the report, it is stated that the accounts of the Post-Office are preserved in an unbroken series from 1685. The net annual revenue then was sixty-two thousand six hundred and eighty-three pounds, and the number of Postmasters one hundred and seventy-four. (Now the latter number over twenty-three thousand.) Mr Scudamore adds that 'in the records not only the quaint orthography peculiar to our ancestors, and varying from period to period, but the changes which were gradually wrought in the handwriting of the nation, may be observed. Indeed, those who are anxious regarding the latter changes can nowhere so effectually study their scarcely perceptible but not the less certain operation than in the records of this department.'

A statute passed in 1710 repealed previous statutes, and provided for the establishment of 'a General Post-Office for the three kingdoms and the Colonies under one head, who was to bear the style of Her Majesty's Postmaster-General, and who was empowered to keep one chief letter-office in London, one in Edinburgh, one in Dublin, *one in New York*, and one in the West Indies.'

The packet establishment in 1764 consisted of *five New York boats*, six Dover boats, and four Harwich boats, and cost the department ten thousand pounds a year. It may be mentioned that these packets during war-times, 'when every sea was covered with French privateers,' gave the Postmaster-General great and constant anxiety. The orders to the captains of such vessels were urgent: 'that they shall run when they can, fight when they can no longer run, and throw the mails overboard when fighting will no longer avail.' Swift boats to escape the enemy were built, but they proved to be too low in the water, and were not successful. Then it was determined to build 'boats of force to withstand the enemy,' and 'boats of force' were built accordingly. To encourage the crews to greater 'exertion' in the combats in which they would be engaged, they were allowed to take prizes

* It is satisfactory to know, however, that the primeval slowness of transit which the petitioners sought to perpetuate was not recognised. The petition was dismissed.

if such fell in their way, and they received pensions for wounds according to a code drawn up with a nice discrimination of the relative value of different parts of the body, and with an amusing profusion of the technical terms of anatomy. Thus, after a fierce engagement that took place in 1705, we find that E. James had a donation of five pounds because a musket-shot had grazed the tibia of his left leg; that G. Treluden had twelve pounds because a shot had divided the frontal muscles and fractured the skull; that T. Williams had the same sum because a shell had stuck fast in his left foot; and that J. Cook, who received a shot in the hinder-part of his head, whereby a large division of the scalp was made, had a donation of six pounds thirteen shillings and fourpence for present relief, and a pension of the same amount. The following scale of pensions for wounds was afterwards promulgated: 'Each arm or leg amputated above the elbow or knee, eight pounds per annum; below the knee, twenty nobles; loss of the sight of one eye, four pounds; of the pupil of the eye, five pounds; of the sight of both eyes, twelve pounds; of the pupils of both eyes, fourteen pounds.' It was stated that in fixing this scale it was considered how much the hurt affected the body, and allowance was made accordingly.

In 1827 a concession was made to the public by rescinding the rule which imposed double postage 'on two letters written on one sheet of paper, and even on a letter and a bill if written on the same sheet.'

In 1830, on the opening of the line between Liverpool and Manchester, mails were for the first time conveyed by railway. In illustration of the greatly increased cost of the conveyance of mails by railway as compared with that by coaches, Mr Scudamore's letter shows that in 1844 the Post-Office received from the coach contractor two hundred pounds a year for the privilege of conveying the mails twice a day between Lancaster and Carlisle, when exactly ten years later the same service performed by the railway cost the department about twelve thousand pounds a year!

After the surmounting of many difficulties with the view of shortening the route to India, then *vid* the Cape, the mails were in 1835 conveyed for the first time by the direct route through the Mediterranean and over the Isthmus of Suez, a line of communication subsequently extended to China and Australia.

As showing the immediate effect of the introduction of the 'penny-post,' it may be stated that while the net revenue in 1839–40 was one million six hundred and thirty-four thousand pounds, in the following year, when the reduction took place, it fell to five hundred thousand seven hundred and eighty-nine pounds, and it did not recover itself for more than twenty years afterwards. Of course postal facilities involving much expense had in the meantime been immensely increased.

So far back as 1857 the practice existed of advertising for defaced postage-stamps on the pretence that a certain number would enable the advertiser to procure admission for a child into some specified charitable institution. In the report for that year the Postmaster-General says that, 'thinking it possible there was a fraudulent purpose in view, I have several times directed an inquiry to be made, but have always found there was no truth whatever in the alleged object, and generally that the whole proceeding was the work of an unknown person actuated apparently by a silly desire to give trouble.' A similar reference to the practice, which had continued, appears in a subsequent report.

In 1858 an order was issued rendering compulsory, to the extent of one rate, the prepayment of inland letters. It was, however, received unfavourably; so much so that it immediately became necessary to withdraw it. The Postmaster-General mentions six reasons that were urged by the public against the order, all of which he answers apparently to his own satisfaction. One of these was that 'all persons may occasionally be without stamps;' but to this he replies: 'So also may they be without paper, pens, or ink; with this difference in favour of the stamps, that they may be purchased at the Post-Office *where the letters must be sent*.' This argument is by no means convincing; the fact that post-offices are sometimes closed appears to have been overlooked.

The Postmaster-General was magnanimous enough to conclude one of his early reports as follows: 'The sharp and watchful criticism of the public eye, even though it be sometimes founded on a mistaken view, is far from being an evil to any Government department; none can expect immunity from it, and probably the Post-Office—the good administration of which concerns every class of the people and depends greatly on a care of minute detail—is more likely to benefit by it than any other.'

## THE FIRST DAISY.

I saw a daisy yesterday
In a quiet green meadow place.
'Twas as if tired earth had wakened
And looked into my face!

My heart went back across the years
To sweet fields far away,
And I heard the children's laughter
In guileless sport and play.

And earth, that seemed so grim and sad
With the ache and pain of old,
Leapt from our age of iron
Into the age of gold!

Dreams that were dead and long in peace
Came back and spoke to me,
With songs I had forgotten,
And the murmur of the sea.

'Twas but a daisy's peeping smile
That made my sad heart sing,
And the youth of the world upleaping,
Wide-eyed, at the kiss of spring!

# FRENCH PERSONAL NOTES.

IT was recently pointed out in a French paper that the space between the English and French coasts is growing yearly wider owing to the falling away of the cliffs on either side of the Channel and the encroachment of the sea. The distance between the two countries is relatively small, but they are still very far apart as regards mutual knowledge.

Family life in France is a close tie, notwithstanding the fact that marriages are based upon finance and arranged with a view to future bread-and-butter. The contract of marriage is as much a matter of business as is a commercial partnership in England; but the dirty work is all done beforehand, behind the scenes, and not in the presence of the principals, who may know as little of each other as a Mussulman knows of the veiled lady in the harem. A friend of rank and fortune once told the writer how she met her future husband for the first time. She was taken to a ball by her mother, who pointed out two eligible candidates from whom to choose. She expressed a lukewarm preference for one of the candidates—'*Il n'est pas mal*' were her words—and the following day the matter was settled by the respective parents. Even girls of fourteen years old know the exact amount of their dowries, and discuss their chances in the matrimonial lottery. Yet no one can say that these bargain-marriages have proved greater failures than hap-hazard, love-at-first-sight phenomena:

> Plaisir d'amour dure un moment,
> Chagrin d'amour toute la vie.

It must also be remembered that the French husband is lord and master of his household. For instance, without his written authority a wife may not sign a lease or open a banking account, and in some cases make a will.

From their appearance, it is patent that French children are not brought up on the same simple food as British children; they dine late, and eat of the same dishes and drink the same wines as their elders. This is probably from motives of economy and to avoid extra meals; but there are very many English nurses and nursery-governesses in French families, with whom they in some cases spend a lifetime. These upper servants appear at their masters' tables with their charges, sometimes at a side-table; and there is no doubt that they are valued for their gentility of behaviour at meals, their modesty, and decent bearing. On the other hand, French servants live anyhow on the top story, rise very early, work very hard, save money, and disregard the sort of pride or self-respect which is the birthright of even charwomen. Are there not abyssmal depths of caste among the latter class in Great Britain? The French servants care not how they eat, sitting or standing at the bare table; their conversation is absolutely coarse and unrestrained, and they are ready to run errands or undertake any kind of work required of them.

The affection and respect of children for their parents, and of parents for their children, in France is great and abiding, and extends also to their relatives. This is proved by the way a family will support and defend one of their own who is in trouble, short of felony, or in a losing cause, whether in the right or in the wrong. Hence their respect for death: the crape of the women and the black garb of the men, who when in mourning may not appear at the club or on the racecourse, still less at the theatre or in any place of amusement, public or private, for months at a time. Anniversaries are solemnly kept and graves visited with great regularity.

The Code Napoléon does not allow freak wills such as often cause divisions in families *outre-Manche*. The law of succession is so strictly laid down that a man may just as well die intestate as not; all disputes are practically obviated by the code.

In a letter to Mr John Durand, dated 20th December 1873, Taine drew up a list of physiological and psychological traits to be observed when studying national character. He noted certain qualities of his countrymen in the letter, among them 'excitability,' especially during revolutions. They become mad, sublime, or ferocious; hence

[*All Rights Reserved.*]

panic, or *furia francese*. 'No Dutch or English ballast to be found in them; in an instant they go out of their minds. In this they resemble women. Prompt to action in gesture and emotion, they require to be amused and hate to be dull.' In the great Revolution the Abbé Maury saved his life by a *mot*. When the crowd shouted '*A la lanterne!*' he replied, 'Will you see me better?' Another, like to be condemned to death, asked if he might not be allowed a substitute, as in military service. The joke got him an acquittal. Their ideals are the things which are agreeable, piquant, or pleasing.

Full of levity and frivolity, they are incapable of considering grave questions for any length of time; they love gaiety, song, amiability, and beauty. The French are of a very sociable disposition, and conversation at table or in a drawing-room is general. Neighbours do not address each other in subdued tones; they have no British reserve or shyness to overcome. A host or hostess, seeing two guests talking with lowered voices, will inquire across the table the subject of their conversation, for fear the two have become bored by the general subject and want a change, or perhaps have something of great interest to communicate—some startling event or piece of news within their knowledge. This custom is somewhat embarrassing to strangers who are not good French scholars. At the great clubs in Paris—there are only five, the Jockey Club, Rue Royale, Union, Agricole, Union Artistique—it is necessary for a member to make himself acquainted with as many of his fellow-members as possible. To sit alone is considered churlish and eccentric, and a reflection upon colleagues as inferiors; so that conversation is carried on in groups—except in the library, where silence is kept. A new member is, on his election, introduced to all the friends of his proposer and seconder as a matter of course.

Taine attributes the sociability of his countrymen to vanity and a desire to shine and give proof of wit and politeness in company. Often at dinner-parties an elderly professional man or professional diner-out will constitute himself honorary chairman as it were, monopolise the conversation, and direct it into his favourite channels, with a running fire of paradox and contradiction.

In Paris one evening a well-known journalist, a specialist on the Vatican and Church matters, had his own way during dinner. He afterwards retired early on the plea of business engagements—in reality because he felt himself put in the shade by another guest, a young poet, who read some original verses at his hostess's request; his deep, sonorous voice and impressive manner, devoid of rant, were too much for the self-elected chairman. Good or bad, the verses sounded admirable.

Much of Victor Hugo's lyric poetry is beautiful in sound and shallow in meaning; the same may be said of many of his speeches, in which he urged the Chamber of Peers with great eloquence to abolish poverty and misery among the people, but suggested no remedies or any means to that noble end. The only concrete policy to which he adhered during his long career was the abolition of capital punishment. He was otherwise inconstant, both in his public and private life—two households in Paris and at Jersey, &c., his wife's and Juliette Drouét's.

Thrift is so excessive in France as to become almost a vice; it is carried to extremes at the expense of legitimate pride and morality; consequently money has greater purchasing-power in certain ways than elsewhere, and can buy honour. Among the working classes the equivocal position of a daughter is not considered disgraceful or shameful so long as there is enough money and some sort of permanence in the liaison. Parents remain on friendly terms with their daughter, who visits them and assists them; in some cases she pays for the education of younger brothers and sisters—in short, contributes to the family income.

*Profiter* is a household word in French life; it means the advantage of obtaining something for nothing. The general rule is, not to hesitate to ask and never to refuse. Guy de Maupassant, the genius who died insane, described the thrift amounting to avarice of niggardly Norman and Picardy peasants, and their eye to the main chance with sacrifice of honour. To be impecunious is somewhat of a disgrace; there was a time when Balzac could not become a candidate for the Academy on account of his poverty. Tradesmen and innkeepers will prevent their grown-up daughters from marrying if there is no immediate financial gain in view; they feel that they are losing their labour, and will be obliged to hire extra servants to replace them—a sacrifice of their children's happiness.

There are no horses or pianos at the farmhouses. All day long, Sundays included, men, women, and children may be seen stooping at work in the fields. In the cities the post-offices are thronged with maid-servants placing their savings in the bank or sending the money home. Tradesmen give servants a commission of 5 per cent. on all purchases; this is an established custom, and is called *le sou du franc*. Although the masses hold Government and railway bonds, the most popular method of investment at a low rate of interest is the acquisition of freehold house-property; it is felt that there is something safe and reliable about house-property—something that cannot vanish. The *modus operandi* of the retired small Paris tradesman or *concierge* is as follows: he buys a plot of ground at Poissy or Melun, somewhere in the Seine valley, builds a house on it, plants vegetables, and lives happily for the rest of his life. His son may be a clerk in a bank, and spend week-ends with his parents; but, better still, he may be a civil servant—the ideal of the bourgeois. The number of civil servants was quite recently calculated at the enormous total of

eight hundred thousand. Although Government salaries are small, they are a certain and welcome increase to the family exchequer, and lend additional social status.

There are some four million landowners in France; land has been much divided up even since pre-revolutionary times; but the *corvée*, feudal rights of the seigneurs, and taxes crushed the small proprietors and made them little better than starving serfs, unable to support themselves or their families, and hastened the great Revolution. The few genuine historical houses that still remain, whose titles are not papal or self-assumed, are not great territorial landowners, such as exist in other European countries. The descendants of Napoleon's aristocracy have not acquired land, and many have already disappeared, representatives of that imperial Court of which it was said 'the conversation of the princesses was no better than the cooks' in distinction of thought and elevation of mind.'

There is a safeguard established by French law to prevent spendthrifts from squandering their fortunes. When it is apparent that a member of a family, male or female, who has attained his or her majority, is extravagant beyond reason, the nearest relations concerned may assemble in council and make application to a judge for the appointment of a *conseil judiciaire* or legal guardian. If sufficient cause be shown the judge appoints a *conseil*, generally an advocate of standing, who has complete control over his client's money, sets aside what he thinks proper for the payment of debts, and allows any sum he chooses, great or small in proportion, for the support of his charge, to whom all credit is barred. This method of guarding the family fortune is very often resorted to in the case of *fils de famille* who have gambled or spent too much money; not a few French houses have been saved from themselves and from complete ruin by it. The chief partner in a well-known firm of motor manufacturers was only released from his *conseil* a short time ago on his own application, but not before he had produced his books to show the profits and income he was earning in the business. Dr J. Horace Round quotes an instance when Cardinal Wolsey, at the height of his power, was appointed guardian of the young Earl of Northumberland, and laid down the exact annual sum to be expended on his wife, his household, retinue, and stables.

'The religious sense,' wrote Taine in his above-mentioned letter, 'is weak. God is diminished and foreshortened or treated like a comrade, as in Béranger's poems;' or scolded, as in Victor Hugo. The religious question in France is delicate and problematical, but less complicated than in Great Britain. The late Lord Bute, in his inaugural address at St Andrews, said: 'Talking about the Reformation is like dancing upon egg-shells.' Since the Edict of Nantes and dragooning under Louis XIV. there has been no religious struggle in France, no Oxford Movement embracing a considerable number of intellectuals. Now and again individuals —a Lamennais, a Renan, or a Loisy—break away from the ancient Church like the portion of an overhanging cliff sodden from winter rains; but what are called fancy religions have never taken root. Christian Science, the Shakers, Mormonism, or self-styled prophets of the type of Thomas Lake Harris arouse the keen French sense of the ridiculous. The Catholic and, in a lesser degree, the Reformed or Huguenot religions are all that count. The Latin races are less inclined to changes of creed than the Anglo-Saxon; three hundred religions and only one sauce still holds good for the Anglo-Saxons.

It is impossible to make any accurate forecast as to the future of religion in France. Modernist writers think that the majority of the population will lapse into indifference, and the Catholic Church become a sect for rich people who can afford and are willing to support their priests and bishops. The reactionaries and the clerical party are gloomy. Reports of depleted seminaries and of decrease in recruits for the priesthood seem to bear out their pessimist attitude. It does not appear that more than 10 per cent. of the population practise their religion, and the question arises as to whether the rural districts, which are accustomed to State-paid religion, will now come forward to fill the gap in the budget of the Church. The priesthood was formerly a career for a farmer's son, as it is in Ireland; but this is no longer the case, now that the Government grants are withdrawn.

The heroine Joan of Arc is claimed both by the clerical party and by their adversaries, the Freemasons—the latter maintaining that the Maid was put to death by Churchmen. In fact, politics are inseparable from religion; usually the hero of one side is the *bête noire* of the other, as in the case of Giordano Bruno in Italy and Dreyfus in France. No doubt the beatification of the Maid of Orleans at Rome will give an opportunity for a reactionary demonstration against the Republic.

In delineating French character, questions of taste and culture are important. These comprise minor considerations of dress and cookery. The great literature of France is on a par with our own; perhaps it is not too much to boast that all literature of the moderns could be spared save the French and English. The rich series of memoir-writers in French history is unsurpassed; in chronological order they descend from Geoffroi de Villehardouin and Joinville (the friend and companion of St Louis in the Crusades), Froissart the Valenciennes cleric, and Philippe de Commynes to St Simon and the contemporaries. So much for the personal side of their literature.

It does not appear that the race is cultured simply from the result of long hours of academic study in childhood and the severity of the course of training they have to undergo—for in-

stance, seven years to become a doctor of medicine —but from natural, perhaps climatic, causes. There is no more cultured race in the world. The vulgarity sprung from ignorance of a yellow press and low music-hall songs from England and the United States is an imported article which the Custom-House should tax severely. It is interesting to remember that the United States adopt the reverse plan: they admit at a low rate what is commonplace, vulgar, or offensive, and place a prohibitive tariff upon celebrated pictures or works of art that appeal to the higher senses and culture of mankind and are in themselves object-lessons.

If England sets the fashion in men's clothes, Frenchwomen lead the world in the matter of the dress of their own sex. Not physically more beautiful than other European nations, and having less pretty faces, they yield to none in grace, attraction, and the arts that please, and they own a *cachet* to which none can attain; they are also perfectly natural in manner and voice, and know not affectation.

The French have long been recognised as the first cooks in Europe. We have nothing approaching the variety of their dishes, so much so that the unsophisticated tourist is as much amazed, after his perennial beef and mutton, as if human flesh had been placed before him. As regards the less elaborate dishes, every one at the humblest inn or in the poorest household can make an omelet. Their salads, ignored by us, are numerous, and their choice of dishes and ways of preparing them legion, although the price of provisions is often much higher than in England.

A point on which great stress is laid and which is much discussed among the French to-day is British hypocrisy. Robert Louis Stevenson held that the French are more frank as a race; but George Gissing, in the *Private Papers of Henry Ryecroft*, his own autobiography, considered that hypocrisy with us is national and not individual—at least, such was his plea for the defence—that we publicly condemn vice with copy-book headings for the great benefit of the majority. Whether this defence is sufficient is a matter of opinion. So different is the moral aspect of the two nations that a French statesman convicted of immorality in his private life would not suffer any disgrace or the loss of his position or office; it would be argued that his private life did not concern his public career as long as it did not interfere with his duty to the State. With us a Cavour would be impossible, and yet he was one of the builders of United Italy.

---

# LAURISTONS.

### CHAPTER XXIV.—HOW, FOR THE FIRST TIME IN HIS LIFE, SIR CHARLES FEARED TO MEET HIS WIFE'S EYES.

HOW they rejoiced in his coming, though the youngsters did their best to moderate their exuberance to a level befitting the fact of their grandfather's death!

They had loved him dearly, but his restrained, Scottish nature had never permitted him to show the half of what he felt for them, although they had fathomed it all the same, and rejoiced in it, and turned it to fullest account.

They flew out at their father as usual.

'How are you, Sir Charles?' was Mavie's greeting. 'We are so glad to see you, Sir Charles. Her ladyship awaits you in her room.'

'Minx!' said her father, pinching her ear as he kissed her.—'Well, Charlie! And Etienne! And John Sax! I left both your grandfathers well and hearty.—And how have you all been behaving since I saw you last?' as Mavie dragged him up the steps.

'Oh, we've all been just as good as good. And how have you been yourself, Sir Charles?'

'It has been rather a trying time, Mavie. It's like getting one's head above water to get to Ealing again.'

'Yes, I'm sure, Sir Charles. Well, we're all going to be very good, Sir Charles, and as little of nuisances as possible.'

'That will be rather hard on you, won't it?'

Mavie opened the door of her mother's room, and announced, 'Your ladyship, Sir Charles Lauriston!' And he braced himself to meet the clear, sweet eyes, as he had never needed to in his life before, and knew it with a pang as a necessary part of his burden and his punishment.

Did she find in the face and eyes she loved something that had never been there before—reservations, concealments, a touch of the shadows? Or was it only his own knowledge and apprehension of these things that suggested it?

'I have been wearying for you, my dear,' she said, with the tender northern intonation which was sweeter to him than sweetest music. 'And you have been having a very trying time, I can see.'

'Yes, it has been a very trying time altogether, Mary. It came so very unexpectedly, you see. And the responsibilities are very great, for he always kept a great deal in his own hands, and I am picking up the threads as best I can.'

'What a good thing John Sax is left to you!'

'I could not get on at all without John Sax. He knows far more about things than I do. But you have not heard the latest news, Mary. Charlotte is going to marry M. de Montessonne.'

'Charlotte!—the marquis!'

'Or he—her. I am not quite sure how it came about. But the result is the same in any case.'

'Why, I never dreamed there was anything between them—nor, indeed, that she still thought of marriage.'

'Well, well! I am surprised. It will be a good thing for the marquis and Etienne, I suppose,' she said thoughtfully—'if he does not throw her fortune away on politics.'

'We are guarding against that. Everything is settled on herself. He can only use her income.'

'That is very wise. I do hope she will be happy. I think he is nice. His manners are certainly all that could be desired, and he has borne his misfortunes manfully.'

'I don't see why they should not be happy. He contributes a certain position, she the money to support it. And a turn of the wheel may at any time set him in his place again in France, in which case Charlotte would feel that she has not lived entirely in vain.'

'And they are both past youthful foolishnesses,' said Lady Lauriston with a smile.

'One might have thought so! One of them is, at all events. We must just hope it will turn out for their happiness.'

'What surprising changes in one short week!'

'Yes, indeed!' said he, and prayed God in his heart—and that with no feeling of irreverence—that she might never learn how great in very truth those changes had been.

Even the children felt their father different in some way from the father of a week ago, though—or perhaps because—he did his utmost to seem to them the same. But childish instincts, unblunted by the rough attrition of the world, are wonderfully keen, and they felt the change, and argued it among themselves.

It was a quieter week-end than they had any of them spent for many a day. But this the children accepted as not unnatural under the circumstances.

'When you've had a funeral in the family,' said Mavie, 'with the Prince of Wales's carriage and the Lord Mayor's and one hundred and fifty others, and dukes and earls as common as blackberries, and all of them using the very worst of language—the drivers, I mean—I haven't a doubt why you're bound to feel more or less tired, you know. And I've heard them carry on most dreadfully when there haven't been more than twenty-five or thirty in Grosvenor Place all at once. Why, I heard one awful man say'——

'You'd better not, miss, or I'll tell Hepsy,' warned Charles.

'Ugh! Tell-tale!'

'No, I'm not. But little girls have no right to listen to such things.'

'I didn't listen. I couldn't help hearing.'

'Well, you shouldn't remember, then.'

'But you can't forget when you don't want to remember sometimes.'

'Well, anyway, ladies don't repeat things like that.'

'Yes, they do. Lady Jane Appledore does.'

'She's an old frump. Don't you take after her, or you'll be another.—Marquises don't swear in France, do they, Etienne?'

'Oh, never!'

No, this Sunday was different from those that had gone before. The children were sent to church; but, for the first time for many a day, Sir Charles did not accompany them. And indeed he looked very weary, and as if the only things in the world he desired were rest and quietness. The shadow—seen or unseen, of the past and of the future—was over them, and to none of them was life ever to be again quite the same as it had been before.

It is hard of a sudden to assume a mask when all one's life has borne a frank and open face, and harder still to wear it with equanimity.

Hardest of all Charles Lauriston found the attempt to meet as of old the loving questioning of his wife's clear eyes. Out of the sweet depths of her soul she had always looked into his and been satisfied. Now, for the first time, she found things there that were beyond her. The stirring of the depths had obscured them.

And he? He tried his bravest to meet her look with sincerity, but the wax was in the honey, and it was no longer clear.

His heart was sick within him, no matter how he strove to justify his action by the bitterness of his necessity. His wife saw that he was troubled, but set it down to the trying days through which he had passed. Her heart could not by any possibility have fathomed the shadowy deeps in which his soul writhed. Love made her very wise. She made no attempt to probe the trouble, only showed that she was cognisant of it, and did her simple best to soothe it.

'For your sake, dear, I wish this had not come. You are doing too much, I fear,' she said gently as they sat alone together that Sunday morning.

Ah God, how much too much!

'It is a very great responsibility. I shall get used to it in time. If I see you worrying about me I shall be afraid to come to Ealing.'

'Never that, I hope,' she smiled. 'You shall just bring all your burdens here and find rest. Or, rather, you shall leave them all in town, and find still greater rest.'

'I will try. You must put up with me as well as you can.'

'We will put up with you,' she smiled again. 'Try us as often as you can, and leave all the loads behind you. Don't let the bank wear you out as it did your father. I, at all events, have no craving for overgreat wealth.'

'Nor I. But it is like a great machine, you see, and it must go on and on, and the man who guides it feels the weight.'

'I wish it could stop, and set you free and give you back to me.'

'Sometime, maybe—sometime, but not yet; not for many years yet.'

How gladly he would have exchanged it all for a pittance and the clean possession of his own soul freed from its bonds! But it could not be. He was bound to the wheel, even to the breaking of his life if need be, and all that he could do was to bear the torture with a quiet face, and strive his best to save her even the sight of it.

He took a short ramble with the children in the afternoon, and for the first time in his life found their light-hearted chatter and frolicsomeness jar upon him.

He tried his utmost not to show it, but they all felt it vaguely. The perfect harmony of their intercourse was disturbed, for the tightened chords of his nature were strained and out of tune.

To cover his own deficiencies, and provide them food for talk, he broke the news of the coming marriage between Aunt Charlotte and M. de Montessonne, and did it in such a way as almost to upset Mavie's equanimity.

'So you and Etienne are like to become related, Mavie,' he began.

'Oh!' and she whirled round on the boys, all a-bristle with indignation, in the belief that some one had betrayed her, and that her father was about to laugh at her. 'Who told you?'

'Who told me? Why, Aunt Charlotte.'

'Aunt Charlotte! And who told her?'

'M. de Montessonne, I should suppose.'

'But how did he know?' with a dagger-look at the unconscious Etienne.

'How did he know, child! I suppose he knew his own mind, and judged it for his own happiness that they should get married.'

'Aunt Charlotte and Monsieur de Montessonne?'

'Yes. Who else?'

'Oh! Ah! Do you hear, Etienne? My aunt is going to marry your grandfather. Now, let me see! What relation shall I be to you?' and the pretty brows knitted tightly over the problem.

'Why, you're going to'—— began Charlie.

'Silly! You don't understand. Be quiet and let me think.—When Aunt Charlotte marries your grandfather she'll be your grandmother, and I should think I'll be your aunt. And when he marries my aunt he'll be my uncle and you're his grandson, and I'll be—— What shall I be, father? Shall I be Etienne's grandaunt?'

'It is rather complicated, isn't it?' said her father. 'Anyway, it's evident you will be in a position requiring great sobriety of deportment.'

'Yes, indeed. It makes me feel quite old already.—Etienne, do put your hat straight, and see that you wash your hands as soon as you reach home.' And the consideration of this piece of news gave them ample food for thought and talk, and occupied all their minds, to the relief of his.

*(To be continued.)*

# GROWING THE BIG RED APPLE IN BRITISH COLUMBIA.

By J. T. Bealby, Author of *Canada*, *Fruit-Ranching in British Columbia*, &c.

BRITISH COLUMBIA produces some of the most beautiful apples in the world; even the Golden Russets blush with bright pink cheeks and the Ribston Pippins rival in colour the ripest of Morello cherries. A country which produces such beautiful fruit must, we unconsciously reason, be itself beautiful, and the life of the men who grow that fruit must be perfectly delightful.

The country is indeed beautiful. The orchards, most of them as yet quite infants in years, are strung along the valleys—the deep, narrow valleys—by which the interior of British Columbia is trenched, either overlooking the river which has grooved the valley or clinging to the skirts of the mountains which frame about the lovely lakes.

As for the fruit-grower's life—well, here is a typical day.

At 5.30 A.M., just as I was waking up from the slumbers of the blest, my ears were assailed by a sudden roar, followed by a continuous rumbling as of a heavy surf pounding a rock-bound coast. It was a sudden tempest hurling itself down the lake with the fierce vehemence which the wind does at times display in the mountainous, wind-sheltered valley in which my ranch is situated. Ere the rush of the devouring gale had thundered five minutes in my ears, I was startled by hearing a harsh, resonant clangour, followed by a strident, grinding after-wail.

A foreboding seized me: 'There goes the windmill!'

And sure enough, almost before I reached the foot of the stairs, I heard my man's voice inquiring for me.

'Well, Harry, what is it?'

'It's the mill. The piston-rod has snapped.' And he went on to tell me exactly how.

After a hurried breakfast I rose to go out to the mill. As I pushed back my chair my wife observed, 'We shall want some wood cut to-day. There is hardly sufficient to cook the dinner with, and there will be none for tea unless you cut some.'

We do not, of course, consume the wood ourselves. Wood is our only and indispensable fuel.

'All right, you shall have some,' I replied.

The pump underneath the mill was put together in sections. We—Harry and I—set to work to unscrew the chamber of the plunger so that we might be able to take out the bottom part of the broken piston-rod. We turned and turned. The heavy piece of iron was becoming unscrewed beautifully.

'Ah, look at that!' exclaimed Harry suddenly in a tone of deep disgust.

I glanced down. We had unscrewed the chamber of the piston-rod at the bottom instead of at the top. What was to be done? We had pipe-wrenches; but they were too small to span the barrel of the pump, and unless we could hold it fast we would not get out the broken piston-rod.

'Well, you will have to go into Nelson,' I said, 'and see if you can borrow a chain-wrench from the hardware people. And you had better take the wagon and bring back a load of coke at the same time.'

Off went Harry. The matter was urgent, for the tank was empty, and water was wanted—in fact water *must* be had—for the greenhouses that morning. It was three miles to Nelson, and the way lay over a rough mountain road, so narrow in places that there is no room for a man on foot to pass the wagon-wheels.

Whilst Harry was gone I turned my attention to the wood for tea. I had sawn off no more than a couple of short lengths when I heard a shrill, excited outcry on the other side of the house. I dropped the saw and ran. There was the gentle, placid cow picking out the daintiest morsels from amongst the young leaves and twigs of the apple-trees. At such sacrilege my hair stood on end. After a hot chase the impious beast was induced, very unwillingly, to return to her brown pasture, for it was now autumn and the British Columbia sun had scorched all the greenness out of the grass.

I set to work to mend the gap which the cow had made in breaking into Paradise. (It was not the innocent, cherubic, red-cheeked apple which had beguiled this bovine Eve, but the humbler, though more tempting, leaf.) Before I was half through the job an urgent message came from the house:

'You're wanted at the telephone. Can you come?'

It was the office of the railway company. 'We've got a box of plants for you. They're in bond, and should be cleared to-day.'

'All right. Thank you. I will see to it at once.'

Did that mean a second journey for Harry? No. I rang up a Customs broker and instructed him to clear for me. I rang up the gasworks in search of Harry.

'Your man left five minutes ago,' was the comforting reply I received.

I rang up the hardware store. 'Your man's just left. You'll get him at the warehouse.'

I rang up the warehouse.

'Well, I've got a big load of coke, sir,' came Harry's voice, 'and I shall have to go back for the plants. And you know it will keep me back half-an-hour or more, and you want the chain-wrench. You must have water'——

'Can't be helped. You must bring 'em. You won't have time to go again this afternoon.'

I finished mending the broken fence. I returned to the wood-pile and resumed my sawing of wood for tea. A few more lengths fell off. Then I beheld Harry entering the yard, driving the horses before him on the long reins, but without the wagon.

Again a premonition of disaster seized me. I was by this time an adept in the interpretation of such occult warnings.

'What's the matter now?' I cried. But it was not information as to the fact I was seeking; it was a nearer definition of the circumstances—the details. 'Where's your wagon?'

'I've had to leave it on the road'—— began Harry.

'Why, what's wrong?'

'One of the hind-wheels went smash. All the spokes have come out, and the wagon'——

'Has gone over?' I interrupted.

'No, she's not gone over. She's still in the middle of the road.'

'And can you get past her—I mean with the light wagon?'

'Oh yes;' and then Harry began to explain in full detail how the accident happened, and all about it.

'Then put Molly to the light wagon, and go and fetch the box of plants and the chain-wrench, and let us take the pump to pieces.'

In half-an-hour Harry was back with the chain-wrench. We had just got it nicely fitted on to the barrel of the pump, when there came an imperative 'Coo-e-e-e!' from the house.

'Hello!' I cried. 'What is it? The 'phone?'

'Yes; can you come at once?'

'Can't you take the message?'

'No; they want *you*,' my wife replied.

I did go at once. I took the receiver and put it to my ear, and called into the mouthpiece, giving my name.

The kind person who had called me had a thirst for exact information that did not altogether commend itself to me then. The voice called, 'Is that you, Mr XYZ?'

'Yes,' I responded. I was not in the mood to volunteer more gratuitous information.

'Oh, have you any parsley?'

'Yes, lots.'

'Will you let your man leave me five cents' worth next time he comes along?'

'Certainly. Who is it?'

'Mrs So-and-so.'

'Thank you. Good-bye.'

Five cents corresponds to the English halfpenny in its purchasing power, at any rate of parsley. I thought just then that the stereotyped valediction was worth all the money. But probably my interlocutor divined that a little walk would render my muscles more supple and easy for manipulating the chain-wrench.

But why go on with the veracious history of that eventful day? I have said enough to illustrate some at least of the adverse conditions under which the big red apple is produced in a British Columbia orchard. Surely the Evil One must have possessed that cow that morning! Or was it that we were still 'tenderfeet,' and our experience was like the leaf of the apple—green? At any rate, in Canadian phraseology, we were 'up against it' with a vengeance!

But it is time to look at the other side of the picture.

Our house, built, as nearly all Canadian houses are, of wood, with a broad, shady veranda running nearly all round it, stands on the shore of Lake Kootenay, of which in the leafy time of summer we get glimpses down the tunnelled vista of a chain of rose-arches. For the house is embosomed in cherry-trees, the branches of which actually brush against it. One of these said cherry-trees, in the summer of 1909, produced four hundred and fifty pounds of fruit, and of this I sold four hundred and thirty-two pounds for a gross sum of ninety-three dollars twenty-five cents, equivalent to a net yield of, say, seventy dollars (equal to fourteen pounds). That was the profit from *one* fourteen-year-old tree, the cherry being a Black Tartarian; and the fruit travelled all the way to Winnipeg, a distance of one thousand and one miles, before being sold for more than tenpence halfpenny per pound wholesale. I understand the consumer in that part of the world sometimes pays as much as two shillings and sixpence per pound for his cherries! That same season I sent a box of Royal Ann (Napoleon Bigarreau) cherries to London, Ontario, a distance of two thousand five hundred miles, and they arrived in 'very good condition.'

I was not speaking altogether in metaphor when I said the cow had broken into Paradise. When the cherry-trees are in blossom, not only are the branches 'feathered' to the very tips, but bunches of white blossom adorn the main trunk and the thick parts of the principal limbs. Then, and also when the apples, pears, and plums are full of bloom, the orchard is in appearance like unto a veritable Paradise. Overhead is a limpid blue sky, before us the unruffled waters of the lake, as bright and glittering as a gigantic sheet of steel, reflecting every cranny and protuberance of the mountains opposite, and etching every twig and branch with magical vividness, and all about us the hot and buoyant sunshine. Apple-blossoms! Last May I measured several of the waxy-white blooms of the Gravenstein apple; they had a diameter of more than two inches each! And the annual yield is in strict proportion. A seven-year-old tree will give over one hundred and twenty pounds of fruit, and its crop will sell for four dollars fifty cents (equal to eighteen shillings and ninepence) to seven dollars fifty cents (equal to thirty-one shillings and threepence); while trees in full bearing produce as much as two hundred and eighty pounds up to nine hundred pounds, the gross profit being forty-three shillings to one hundred and fifty shillings, or at the rate of one hundred and ten pounds to, say, three hundred pounds per acre.

The factor which has most to do with bringing about these truly remarkable results is the climate. Equally good results are obtained on soils of very different character. The prevalent soil of the interior of British Columbia is a light-red loam; but grit (disintegrated granite) and sand produce apples which have beaten all competitors on the show-table—for example, Ribston Pippins at the great Spokane Apple Show in November 1909. The growth which a tree favourably situated will make in a single season almost passes belief. Little grafts, only two inches long, put on in April will by the following October measure four feet six inches in length, and near the base will have developed four to eight well-set fruit spurs. No wonder, then, that apple-trees in British Columbia orchards yield fruit in the fourth and fifth year after planting; nor is it any wonder that trees which grow at such a remarkably rapid rate are brittle and frequently break, especially under the load of fruit which they carry. It is not at all an uncommon sight to see a little apple-tree surrounded by a small forest of props, till it looks like the skeleton framework of a circular tent.

Nor is it the apple alone that thrives in this wonderful way. All other hardy fruit grows equally well, and is equally prolific. During the summer of 1909, for instance, the crop of plums in my orchard was so extraordinary that, in spite of props, the branches broke under the weight of the fruit they bore. Young trees, not more than six or seven years old, groaned under burdens of one hundred to one hundred and sixty pounds of fruit, the value of the yield of a single tree ranging from three dollars to ten dollars (equal to twelve shillings and sixpence to forty-two shillings). When you recall the fact that plum-trees are usually planted over one hundred and thirty to the acre, you can realise something of the profit of an orchard in British Columbia.

Apples are planted forty-eight to seventy to the acre, and estimating a profit of fifty shillings only per tree, we see that an acre of orchard in bearing will yield a revenue of well over a hundred pounds. The expenses of cultivation are not heavy, the chief items being for cultivation pure and simple, for manuring, and for spraying. The soil of British Columbia, regarded as a factor for the production of fruit, is in general somewhat deficient in nitrogen.

This is best supplied by ploughing in clover. Hence the manuring of the fruit-trees is very often effected by turning in a crop of clover. Spraying, even if done twice, or as much as three times, a year, costs only a very few pence per tree. Spraying is compulsory by law. Government inspectors visit the orchards in the spring, and if they discover any indications of fungoid growths or insect ravages, they instantly order the owner of the ranch to spray, generally with a mixture of lime and sulphur, with or without a small proportion of salt.

Thanks to these measures, and to the unsleeping vigilance of the authorities at the entry ports of the province, British Columbia fruit is remarkably free from blemishes. I have never seen a worm-eaten apple since I came into the country. One of the first things that arrests the attention of the newcomer is the silvery brightness and smoothness of the bark of the apple-trees. Not a sign of canker; scarcely a rugged or corrugated trunk. And the colour of the fruit! It is simply astonishing. A well-packed box of, say, M'Intosh Red or Jonathan or Spitzenberg apples is a sight which, once seen, is not readily forgotten.

Fruit-packing has been elevated almost into a fine art. Apples, pears, plums, peaches, cherries, currants, strawberries, tomatoes, are all packed in boxes of regulation size and shape, the dimensions being fixed by law. The apple-box is so arranged as to hold approximately forty pounds, no matter what the size of the apple. There are several models of arrangement of the fruit in the box, distinguished by the number of tiers or layers placed one upon the other. This information—that is, the number of tiers, together with the name of the variety, and the name and postal address of the grower or packer—must by law be plainly stamped upon the end of each box. If the fruit is to travel far the box is lined with paper, and each apple is wrapped separately in a sort of coarse tissue-paper. The aim of the packer is to make the apples tight both ways in the box, and to leave the top tier perfectly regular when viewed both endwise and across the box. Cherries too, although it may sound somewhat strange, are packed with symmetrical regularity and often with the most skilful evenness in shallow boxes, and when fringed about with an edging of white cardboard, are irresistibly tempting.

The life of the fruit-grower in British Columbia is, so far as the surroundings—the scenery and the climate—go, perfectly delightful. But it is not at all the life of a lotus-eater. *Dolce far niente* is unknown to the conscientious orchardist during the fruit-season—that is, from the middle of June to the middle of November. The climate is indeed excellent, but the big red apple, for which the province is justly celebrated, is not produced without much vigilance, care, and labour, incessantly renewed day by day and week by week. Fruit of such sterling excellence is like the reputation of the professional man; it is not got without the expenditure of a considerable amount of toil and intelligence. But then, again, like the reputation of the successful law pleader or the successful physician, it possesses a proportionally enhanced value. Whereas the ordinary price of a box of apples may be two dollars, the price fetched by a box which has won a big prize at one of the great apple shows of the West may range all the way up to ten dollars, and at least one instance is on record of apples of the Winter Banana variety fetching twelve dollars per box wholesale, equivalent to a price of one shilling and threepence per pound. This, it need hardly be observed, was an exceptional case.

At present the orchards of British Columbia produce but little more than is needed to meet the demands of the home local markets. But hundreds of acres are being planted every year, and planted with varieties (e.g. Northern Spy) that sell well in the vast and constantly growing market of the Prairie provinces; though a great many acres are being set out with apples, such as Cox's Orange Pippin, Spitzenberg, and Yellow Newtown Pippin, destined for London, Liverpool, Glasgow, and other British markets.

## THE MAJOR'S CLOCK.

### CHAPTER II.

ORE than a year had passed. On the previous night of the 18th October 1813, at the end of the third and last day of the battle of Leipzig, our army had commenced the retreat. The Emperor himself had gone, leaving MacDonald's Corps (to which my regiment belonged), along with Regnier's and Lauriston's, to cover it. Personally I had no idea that the retreat had been ordered. For fifteen hours the day before I had been in the saddle, and, soaked to the skin, had passed the night on a baker's oven with a few of my troopers around me. A fatal mistake was made in allowing the caissons to be blown up. Each tell-tale explosion informed our foes only too surely that the retreat had really commenced, and gave them fresh hope. Luckily, however, they had suffered so severely, and their troops were so fatigued, that they could not at first take full advantage of it. But even the deafening noises of these explosions in different parts of the city had failed to wake me; and it was only the shaking of my *marshal de logis* to inform me that the next house was on fire that roused me from my slumbers.

Of my squadron only thirty men could be found. Utter confusion reigned everywhere; the chain of authority was completely broken. It was a case of every man for himself. Quietly, even leaving their arms and accoutrements behind, and in many cases donning civilian clothes, some men had got over the bridge while there was yet time.

'Thus about midday of the 19th, with the rain steadily falling, I found myself with a small remnant of my men in a narrow street which led to the bridge that crossed the Elster a little beyond the Thor gate on the Frankfort road.

'"Make way there! Make way there!" suddenly shouted some Poles behind us.

'By pure weight, by trampling down some, and by pricking men and horses with their lances, they had got thus far, but they got no farther, for the wheels of two wagons had become locked, and for the time the way was completely blocked, and they were obliged to turn back. In the midst of them I saw their brave and beloved Prince Poniatowski, who had only three days before been made a marshal. His handsome face was deadly white; his left arm was in a sling; his fingers shone with rings; even his epaulettes had diamonds in them (for he had all Murat's love of finery); thus the gallant Pole passed on to meet his death at the river.

'At that moment an explosion, certainly far louder than any we had previously heard, took place; still, we paid little attention to it. Thicker and thicker grew the crowd of panic-stricken fugitives. Artillery, infantry, were all jammed together, cursing and swearing at the delay. And, to add to the terrible confusion, some bullocks got mixed up with wagons full of wounded, and also some private carriages; while the shells went whistling overhead and falling into the houses, setting them alight. Soon we came to a complete halt.

'Suddenly a cry arose that the bridge across the Elster, our only hope of escape, had been blown up. Men whose courage till that moment had kept them up turned white with despair. They cursed the Emperor, saying he had deserted them again, as he had done in Egypt and Russia; they cursed their marshals and their officers. Many threw down their arms and threatened to surrender; though others reminded them that they would gain nothing by doing that, as they would get no mercy from Blucher's butchers in any case.

'We happened at that moment to be opposite a rope-shop, which of course was strongly barricaded. Suddenly a *bourrelier* (harness-maker) of artillery commenced kicking and banging the large doors at the side of the shop, saying that he knew there was a passage that led into the next street. Drowning men catch at any straw. Certain death seemed to await us if the shells set the houses alight.

'"He is right, *mes enfants*," I cried, for I knew the plan of the town well. "Smash the doors and follow me."

'"Yes," said Mayron, my old *marshal de logis*, who had been in Leipzig before during the campaign of Jena; "and I know where there is a ford."

'I was about to jump off my horse, when I heard an agonised voice calling me by name.

'"Save me; oh, save me, Captain Dorisart! If there's really a ford, could a carriage get through?"

'I turned round. It was Moyart! For a moment I was too surprised to speak.

'"No," I said bitterly at length, "especially if it is full of other people's clocks."

'Then my conscience smote me, for during the long months when I was recovering from the fever, and the bitter remembrance of the lost clock came into my head, my good mother, in her poverty, had often told me that I must learn to forgive him.

'"I have wronged you," he cried, getting out of his carriage; "but only save me, only let me get to Paris, for private reasons, ere the Emperor does, or I shall be ruined if he finds out something. You shall have the clock; and take this," he continued, pressing a morocco case into my hand. "If you are married, give it to your wife; or if not, to your *fiancée*."

'I said nothing; it seemed to me that fear had driven the poor wretch out of his senses; for the man must be wandering to talk to me about wives or *fiancées* when I had only my pay to live on. The door by this time had given way and the crowd was pressing through.

'"Follow me," I said to Moyart. "Take hold of the stirrup-leather."

'"I can't," he said. "I am too weak. I have been a prisoner for months in Russia. Then after I escaped I caught a fever at Dresden. I am only just out of bed."

'Then I looked more closely at him, and saw how hollow his cheeks were, and that his eyes had an extraordinary unnatural brightness in them. Poor wretch! I felt certain that he would never reach Paris, for I knew what was in front of us. The river, and the river only, was our hope now, and this had to be swum. It was no time for words. Dismounting, I seized him—he was as light as a feather in spite of his height—and got him into the saddle. Shouting to the few men of my squadron who were near to follow me, and leading my horse, I forced my way to the passage.

'"*Prenez garde! prenez garde!*" came from all sides.

'A bullock, goaded into madness, was charging right and left. Suddenly it took a turn to the left into the narrow pathway, which was really a rope-walk. *Ciel*, how those in front ran! But, anyway, it cleared the way for us who followed it. We then found ourselves in a narrow street not far from the walls. Most of the men made to the left, towards the bridge and Reicherts Garden (it was by the latter Poniatowski, we learned afterwards, had reached the fatal river), because they knew that the Russians and Prussians were closing in on the north-west.

'"To the right, then first to the left, and through the Rastaht gate!" shouted the *marshal de logis*. "I know the way to the ford."

'Then I got on my horse, and, with Moyart clinging closely to me, followed by perhaps a dozen of my own men and some artillery-men who had cut the traces of their horses, was soon in the swampy fields, racing towards the Elster, which in normal weather is but a little stream, but the terrible continuous rain we had had for a week had made it a very formidable obstacle. Thus when I reached the bank and saw the fast-flowing, muddy, swollen stream beside me, my courage almost sank. Galloping on, we passed Thomas's Mill.

'"Here's the ford, *mon capitaine*," shouted Mayron as he reached the shelving bank that led to it.

'But as I heard the rush and gurgle of the waters, and saw the bubbles and the yellow leaves in the centre floating quickly along the surface, I hesitated. Some, however, waded in, but in a moment their horses were swept off their legs, and I saw them carried down and heard their piteous cries for help. That was enough, so I rode on, for in the distance I saw some woods, and thought if I could only reach them I might have time to look about; but, alas! I was not to have the chance, for a sudden cry of "*Cosaques!*" arose, and, sure enough, on our right flank I saw a whole *pulk* of these barbarous brutes waving their lances, and, with loud "Hurrahs!" coming towards us as fast as their little *sotnias* (ponies) could bring them. These savages always charge in a group; they have no regular formations; but seeing us in scattered bodies tearing along the bank, they at once opened out like a fan.

'Now had I been alone on my own horse, which was a remarkably fleet one, I would have risked reaching the cover of the trees; but in a charge it had been shot under me on the first day of the battle. It happened that as I was taking my pistols from their holsters a typical heavy German *Junker* came thundering up, shouting out to me to surrender. For answer I shot him through the right shoulder; his sword dropped, and he involuntarily pulled up. Covering him with my other weapon, I ordered him to get off his horse, and rode off on it. It was a great, heavy, pounding animal of enormous strength—in fact, half a cart-horse; but, as good luck would have it, in the present circumstances having to carry two, it was far better than my old one. I saw it was no good to continue; I was bound to be cut off from the woods, for the bulk of my foes were not two hundred metres from me, while others, apparently guessing my intention, made to the right to head me off. There was nothing, therefore, to be done—for my steed was very slow—but to trust to Providence and plunge into the boiling stream. Taking my pistols from their cases, I stuffed them under my epaulettes to keep them dry.

'"Hold tight!" I shouted to Moyart.

'"Let me get off! Let me die! Holy Virgin, protect me!" he cried; and he continued to beg and implore me to let him descend, so great was his terror.

'I paid no heed to him, and, pricking up my horse, I plunged in. My companion gave a shuddering cry, a deep gasp; and well the poor wretch might, for, oh, *ciel!* the water was cold; but the fine, powerful beast beneath us swam well under his double burden. We made way, but were fast being swept down; and when in the centre the animal tried to turn and swim with the current, and it was only with great difficulty that I could keep his head to the opposite bank. If his strength would but last out, I hoped soon to grasp the overhanging willows.

'"*Vorwarts, vorwarts!*" I shouted to encourage him, as, snorting and shaking his head, the brave creature continued his fight for life. The progress was slow, but that we were gradually lessening the distance there was no doubt; in fact, we were more than three-quarters over when, with wild shouts, the Cossacks reached the bank behind us. Some few had pistols, and the bullets splashed around us.

'All this time poor Moyart, with chattering teeth, was calling in a spasmodic way on the Virgin for help. Suddenly he ceased, gave a stifled cry, a gasp, and clutched me convulsively, and I knew he was hit; and though in a measure I was protected by his body, every moment I expected the same fate myself. But what, perhaps, I dreaded even more was that my horse should be struck; for in that case, with Moyart clinging to me, I knew I should have no chance, and must sink like a stone. But Providence, so my mother always said afterwards, in answer to her prayers, watched over me; for we had been swept down so far that we had reached the ford. In desperation I urged my brave steed on; he made a final effort, his feet touched the ground, and dripping from head to foot, I rode him triumphantly up the bank, amid yells of disappointment from my foes. In the fixed, hard grip of death, Moyart had got so firm a hold of my belt that as I dismounted I brought his body with me, and it was only by cutting the belt that I freed myself from the corpse.

'Fastening my panting horse to a tree, I quickly searched the body. I had hardly placed all the papers and valuables in my pocket, when I heard a cry for help from Mayron, who had entered the stream about the same time as myself. All this time the Cossacks on the bank continued to fire at me and those in the water. As far as I was concerned, as soon as I reached the land I paid little attention to them, for I was too far off to receive much harm from their old horse-pistols; but one of them had evidently got a superior weapon, for as I ran forward to help Mayron I received a bullet right over the heart. Providentially it struck the case that Moyart had given me; but for that, I must have been killed. The shock made me reel, but it was the last the fellow had the

chance of firing; for I drew my pistol, and standing behind a tree, took steady aim at him. The first pistol was damp and missed fire, but the bullet from the second struck him fair in the chest. This was more than the others bargained for, and the effect was extraordinary, for with one accord, on seeing their comrade's fate, they all turned and fled. I had always heard these Cossacks were arrant cowards, but I never reckoned on their cowardice being so great as this. Thus I was enabled without the slightest hindrance to save the life of the *marshal de logis*, who, half out of the water, was clutching a branch, and yet was too cold and entangled by weeds to get to land. Leaving him, I got two more to land, and with their help we saved some horses whose riders, alas! had been drowned, and then set off for Lindenau, where we fell in with Oudinot's corps of two divisions of the young Guard, who were covering our retreat.

*(To be continued.)*

# A STRANGE MAUSOLEUM.

By S. Baring-Gould.

O little interest was excited in the year 1907 in Plymouth by the opening of the mausoleum of Sir James Tillie of Pentillie Castle, that stands in a picturesque position above the Tamar where it forms its most tortuous windings.

The mausoleum is a lofty brick tower on a platform ascended by a flight of steps, and originally consisted of two stories. It was erected to receive the body of Sir James Tillie, knight, who died on the 15th November 1713, and by his will directed that his body should be disposed of in a manner described by himself in a memorandum he had left with his wife.

Hals, who wrote in the middle of the eighteenth century, and whose manuscript *History of Cornwall* is in the British Museum, says: 'Sir James Tillie, . . . by his last will and testament, obliged his adopted heir, one Woolley, his sister's son, not only to assume his name (having no legitimate issue), but that he should not inter his body after death in the earth, but fasten it in the chair when he died with iron, his hat, wig, rings, gloves, and best apparel on, shoes and stockings, and surround the same with an oak chest, box, or coffin, in which his books and papers should be laid, with pen and ink also; and build for reception thereof, in a certain field of his lands, a walled vault or grot, to be arched with moorstone; in which repository it should be laid without Christian burial; for that, as he said but an hour before he died, in two years' space he would be at Pentillie again. Over this vault his heir likewise was obliged to build a fine chamber, and set therein the pictures of himself, his lady, and adopted heir for ever; and at the end of this vault or chamber to erect a spire or lofty monument of stone, from thence for spectators to overlook the contiguous country, Plymouth Sound and harbour; all which, as I am told, is accordingly performed by his heir, whose successors are obliged to repair the same for ever out of his lands and rents, under penalty of losing both.

'However, I hear lately, notwithstanding this his promise of returning in two years to Pentillie, that Sir James's body is eaten out with worms, and his bones or skeleton fallen to the ground from the chair wherein it was seated, about four years after it was set up; his wig, books, wearing apparel, also rotten in the box or chair where it was laid.'

As far as we can judge, there was no subterranean vault. The chamber in which sat the body of Sir James was the lower stage of the tower, and this could be looked into through two slits in the stone; the door was bricked up. It was through these slits that the curious observer could study the process of decay in the body of Sir James.

When he had completely gone to pieces, his descendant opened the chamber and set up in it a statue of the knight seated in his chair, in wig and full dress, carved in sandstone, precisely as the corpse had been placed; and as the roof of the chamber fell in, this could be seen very distinctly through the slits above mentioned. But what was done with the bones no one seems to know. Now, during last summer it became necessary to open the mausoleum, for a tree had grown up in the midst, which not only obscured the sight of the statue, but also menaced the tower. Accordingly the present owner of Pentillie, Mr Coryton, broke into the mausoleum and had the tree cut down.

The news that Sir James Tillie's resting-place had been opened spread like wildfire in Plymouth, and troops of people came out to see if any relics of the strange knight remained, and it was with difficulty that they were prevented from invading the precincts. However, no bones were found; and it is supposed that the last heiress of the Tillies, who conveyed the property to the Corytons, and who was a pious woman, was shocked at the idea of her ancestor's bones lying scattered on the floor of the chamber, and that she had them privately removed and buried in the churchyard of St Mellion, the parish church.

And now a few words about Sir James. He was the son of a labourer at St Kevern in Cornwall, and had been put as a horseman in the stables of Sir John Coryton of Newton Ferrers in St Mellion. As he was a sharp boy, Sir John took him from the

stables and put him with an attorney, and eventually made him his steward. Moreover, when Sir John Coryton died, he made him trustee for his children. James Tillie managed to feather his nest pretty well; and he married the daughter of Sir Harry Verney, the Parliamentarian, who was executed under Charles II., and by her obtained a good deal of money. His ward, the younger Sir John Coryton, married the daughter and heiress of a wealthy City knight who had been Lord Mayor of London; and on his death without issue Tillie, now a widower, speedily married the widow, the heiress of the Lord Mayor, and annexed all her property. His ambition now was to found a family. He built Pentillie Castle, and got James II. to knight him.

Hals, writing before his death, says: 'Soon after James II. came to the Crown, this gentleman by a great sum of money and false representation of himself obtained the favour of Knighthood at his hands, but that King some short while after beinge inform'd that Mr Tillie was at first but a groom or horseman to Sir John Coryton, that he was no Gentleman of blood or arms, and yet gave as his coat-armour the arms of Count Tilly of Germany, ordered the Heralds to enquire into this matter; who, finding this information true, by the King's order entered his chamber at London, took down these arms, tore others in pieces, and fastened them all to horse-tails and drew them through the streets of London, to his perpetual disgrace, and disgraced him from the dignity of that being, and imposed a fine of £500 upon him for so doing.'

Hals was wrong as to the amount of the fine, which, Mr Luttrell informs us, was two hundred pounds.

There was a very ancient family of Tilly of Cannington in Somersetshire, but Sir James did not venture to adopt its arms; and his nephew was obliged to obtain a grant of arms from the Heralds' College in 1733 that in no way resembled the coat borne by the Tillys of Cannington.

The portraits of Sir James and his lady and nephew that were to adorn the upper chamber of the tower have been removed, and are now in Pentillie Castle. The long will of Sir James may still be read in Somerset House. It is somewhat pathetic to see how he laboured to secure Pentillie Castle and his large estates to one of his own family and to continue his name. But man provides and Heaven decides; and eventually the Tillies expired in an heiress who brought the property back to the Corytons, whom, there can be little doubt, as steward, he had unscrupulously plundered.

# BETTY AND I IN THE AIR.

By FIAMA.

BETTY and I believe firmly that new experiences are the salt of life. Therefore, when she telephoned to me one day, and announced that her cousin Bob had entered his balloon for the coming great balloon contest, and proposed taking us as passengers, I accepted enthusiastically. I had to run the gauntlet of opposition from various members of the family when I sprang the news upon them, but the gloomy prophecies of an early death in no way damped my ardour. My brother-in-law, generally known by the sobriquet of the 'irascible major,' expressed himself forcibly: 'Infernal nonsense I call it! Of all the silly fools, recommend me to these aeronauts!' And as this did not sufficiently impress me: 'Fact is, you're too *stupid* to appreciate the danger,' was his parting thrust.

'My dear,' said Aunt Amelia, 'since you are bent on this folly, provide yourself with a large cotton umbrella, which would doubtless be invaluable as a parachute in case of emergency.'

One gentleman of my acquaintance, of foreign persuasion and jealous disposition, came to take a last farewell, with a funereal expression of countenance. 'It is not kind to those who care for you,' he said. 'You have not the right to do anything with Joe Pardy.' Suppressing hysterical laughter, I assured him, on the authority of those who know, that there was far less jeopardy in ballooning than in crossing Piccadilly Circus.

'The question is—clothes,' said Betty when we met to discuss. 'Every one will don her best bib and tucker to see us start. We must look workman-like and sporting; and, don't forget, knickerbockers under a short skirt, in case of a reverse. But I don't see why we shouldn't wear becoming hats!' Bob insisted on a dress-rehearsal, and disposed summarily of Betty's picture headgear. 'Oh, very well; I'll wear a beehive, then, if it is only circumference that counts,' she said graciously. Bob was particularly insistent on the length of our hat-pins, being anxious to come down with the sight of both eyes unimpaired.

He told us the balloon was to carry four, which was the competition complement of passengers. I noticed Betty was rather suspiciously indifferent when he named the chosen 'fourth.' Bob is a dear, but not observant. 'He has been up with me before, and knows enough to do what I tell him,' he explained.

The auspicious day dawned, the most glorious of ballooning-days, to our earthly idea—hot sun and a gentle breeze. Betty was unusually silent as we sat in the motor on our way to the starting-point. 'I signed my will last night,' she announced; 'not that there's one iota of danger, but you never know.'

Arriving at our destination and entering the holy of holies railed off from the spectators, we soon lost the sense of our own importance as we watched the stir of preparation for the race. Thirteen or fourteen balloons were swaying with the breeze, looking like huge prehistoric monsters straining at the leash impatient to be off. We found Bob and the 'fourth' busy packing instruments, maps, and other necessary impedimenta into the basket. We were allowed a quarter of an hour of grace to bid farewell to friends beyond the 'pale,' and went round receiving wishes of 'good-luck,' 'safe-descent,' and hand-shakes somewhat disconcerting in their finality. And then came a peremptory summons from Bob. At last! Excitement thrilled and tingled in our veins.

Betty grasped my arm.

'Not nervous?' I asked.

'No!' scornfully. 'But swear one thing; if I'm sick you won't tell the family. And whatever happens, don't let Bob have reason to say women are in the way on these occasions.'

We climbed into the basket—Bob and I on one side, Betty and the 'fourth' balancing us on the other—and when our turn arrived were hauled and bumped to the starting-point, and there held down by about twenty men straining every muscle while our lifting-power was checked. It was the aim of each competitor to carry as much ballast as possible for manœuvring purposes.

Then came the signal: 'Right! Let go!' and we were off, soaring up and up, smoothly, easily, like some great bird glorying in the freedom of flight; up and up, endlessly it seemed, right into the blue vault of heaven, the world sinking under us, while the cheering of people on roofs and other points of vantage grew fainter and fainter, till at last we seemed to hover in space, waiting, a great stillness all about us, and a panorama below which simply took my breath away. I suppose, in aerial navigation, like everything else, familiarity blunts the senses, but the first experience is—well, just indescribable.

'Well, how do you like it? Six thousand feet,' said Bob, breaking the spell.

'I don't know—yet,' I answered weakly and somewhat breathlessly, trying not to realise that there was only that frail little basket between us and illimitable space. And then, on a sudden impulse, I knelt down and peered over. The feeling wasn't even akin to fear; only, I had wanted a new sensation, and I got it to the full! In less than ten minutes I felt absolutely normal, and was able without a qualm to lean over the world and help to adjust my end of the basket-leaf, which is let down to spread the maps on. The atmosphere was as clear as crystal, and London (looking like a tiny little hamlet) and the surrounding country for miles and miles stretched below us—a marvellous view.

'That *can't* be Kensington Gardens and Hyde Park?' exclaimed Betty.

It really appeared to be a tiny little green table-centre, with the round pond resembling a finger-bowl at one end. What astonished us was that all the buildings seemed to be of the same height; and here and there tiny objects like black beetles were crawling in and out, which we knew to be those monsters of terror to the ordinary mortal—motor-omnibuses!

Then, all of a sudden, I became deaf. Horrible tales of pressure on the brain at high altitudes, bleeding noses, and bursting heads flashed across me. Mentally registering a Spartan vow to suffer silently, I said nothing.

But, to my relief, 'Funny thing, but I'm deaf,' came Betty's voice from the other side of the basket.

'That's nothing. Swallow,' said Bob unsympathetically but to the point.

It is heavenly to be a balloon-passenger, but the post of sky-pilot is certainly no sinecure. What with shifting the ballast-bags, watching the risings and descents, following the map, noting the currents, and keeping the log (I think they call it), our two companions were at work from start to finish.

Above, below, behind, and in front of us were dotted the other competitors in the race, all taking slightly different courses, according to the currents they had struck.

'There's an awful smell of gas,' said Betty about this juncture, rather as if she were alluding to a bedroom pipe; 'and I am dying of thirst;' which was a natural consequence of the 'escape' that we did not realise at the time.

'Here, have some tea, then,' said Bob, with one hand doling out sand—some of which came back in our faces owing to our quicker rate of descent—and with the other holding out the thermos flask; 'only, for Heaven's sake! help yourselves—no time for polite conventionalities up here—or you'll have it sitting on the dome of St Paul's.'

Sure enough, we were gradually and unaccountably sinking. Bob told us afterwards he rather suspected a leak.

Betty and I luckily in no way appreciated the awkwardness, not to say risk, of descending in the middle of the City, and wondered why the 'fourth,' under Bob's orders, was hurriedly letting down the trail-rope and making other mysterious preparations, Bob meanwhile throwing out ballast for all he was worth. Two whole precious bags had disappeared before, to our relief, the statoscope showed we were rising.

'It was a confounded down-current,' said Bob, wiping his brow. 'Now, if only the sun will come out again and warm us a bit, up we'll go.' And, as if in answer to his words, King Sol appeared smilingly, and with the consequent expansion of gas we rose again.

Betty and I were by this time enthusiastically excited over our prospects in the race, eagerly

scanning the positions of our rivals, and following our progress on the map, our hopes falling below zero when the 'fourth' pointed out that we were travelling in a wrong direction for the goal, now some seventeen miles away. How we prayed for a more favourable current!

'We are going to post some cards,' announced the 'fourth' in a momentary lull in his labours. There ensued a slight whispered controversy as to the destination of Betty's, and then we leant over—Betty thrusting the beehive with no little difficulty between the ropes—and watched the little white things fluttering earthward with red ribbons attached. This gave me the first sensation of giddiness I had yet felt.

It is only when you have some connection with earth, Bob explained, that there is a tendency to giddiness; for this reason he had tried to distract our attention when the trail-rope went over, a drop of three hundred feet sheer.

It was a most curious sight when about this time one of the other competitors passed immediately beneath, travelling in an opposite direction, so close that the occupants of the basket could almost touch our trail-rope, and were within easy speaking-distance. We looked down on their balloon—rather like the top of a melon it appeared—and speculated as to what might have happened if we had bumped. Bob remarked that it was about as near as he ever wanted to be to another, and it gave you some idea of what it will be like when the sky is a public road frequented by 'air-hogs.'

We had cleared London and the suburbs by this time, and, in place of the hitherto cloudless ether, the balloon seemed to be resting on a thick brown heat-haze; it lay dark and menacing on the horizon at our level, while above was the clearest liquid turquoise, against which some of our rivals stood carved out with vivid distinctness. One or two had what appeared to be pale-yellow comets' tails, by which we knew they were letting out sand.

'Not enough ballast left,' announced Bob. 'No help for it; we'd better begin to look out for a likely spot to come down.'

'Oh no! *Must* we?' Betty and I exclaimed in a breath. The excitement of the contest was tingling in every nerve, and we would willingly have shed *any* garment as ballast. Betty suggested parting with the tea-basket, utterly callous as to the human beetles it might crush below. Yes, we were slowly but surely nearing Mother Terra.

'Take the glasses and see that there are no telegraph-wires,' called Bob to the 'fourth.'

A cock crowing and other small but distinct sounds were borne upwards, showing that the distance was rapidly lessening.

'Be ready to bend your knees and hold on to the ropes for the bump,' Bob directed.

'Where ignorance is bliss'—— Betty and I were undaunted at the prospect of bumps.

'Oh! try to go on a bit.' This from Betty. 'I see a heavenly park over there. There's sure to be a lovely house, and they'll give us tea.'

Being a member of the S.P.C.A., I called out that we were in danger of annihilating a flock of sheep, but all my appeals fell on deaf ears, for Bob was exerting every sinew and holding on to the valve with might and main. No wonder, for all the precious ballast—almost as precious as the last provisions to a shipwrecked crew—which was left to us, with some four thousand feet between us and the hard earth, was one bag and a half! I have a dim recollection of Betty on her knees, frantically scraping together handfuls of sand-leakage at the bottom of the basket.

After that we went down so quickly that it is difficult to recall sensations. A few vague lilliputian forms running in the fields below, a shout from Bob to them to catch the trail-rope, then, 'Stoop right down and hold the bottom ropes'—and a bump.

Over! I thought; but in a second up we shot again, how high, from my lowly position at the bottom of the basket, I couldn't judge. Also—tell it not *in* Gath—I had my eyes shut. Anyhow, it *felt* likes miles. Then, 'Out with the anchor,' with a few stronger words interspersed between gasps.

This order from Bob was followed by a succession of jerks, violently shaking us backwards and forwards, as the anchor caught in the furrows of the field. Then more bumps and another rebound like a rocket skywards. Of how many times this gentle proceeding was repeated I lost count. I remember hearing a final order to 'rip,' and opening one eye and catching sight of the gas-bag deflating slowly, like the toy 'dying pig,' and dying very, very hard. And then, at last, tired out, the monster lay, crushing down the best part of a field of beans, which hitherto had blossomed innocently and peacefully, unconscious of the coming bolt from the blue.

Out we clambered, rather shaky about the lower limbs, but still undaunted.

'What *do* I look like?' was Betty's first question, the eternal feminine asserting itself, as she adjusted the beehive, which had assumed a rakish angle.

'One moment,' said the 'fourth,' camera posed. 'Thank you!'

'Oh!' groaned Betty.

In less time than it takes to write the field was full of farm-hands and men of all descriptions springing from goodness knows where, newspaper reporters arriving on motor-bicycles, not forgetting the ubiquitous policeman, pomposity personified, all gesticulating, questioning, trampling. Alas for the bean-field and damages!

Betty and I grasped the tea-basket, climbed a gate into the next field, and there stretched ourselves luxuriously on the grass midst the buttercups and daisies. It was all so remote and peaceful, with an insistent cuckoo calling overhead, that it

was difficult to realise that we had descended from the sky.

'Heavenly, wasn't it,' I sighed, 'in spite of the come-down?'

Suffice it to say, we were both ready and eager to go up again on the spot, had it been possible.

In less than half-an-hour two somewhat dishevelled but cheery forms appeared over the gate.

'Hullo! hullo!' called Bob. I'm certain he was relieved that his responsibility for our precious lives was over. 'Well, sorry we bumped a bit. The wind caught us; but it wasn't so bad, was it?'

If we had perchance a slight hankering after praise of our valour we should have remembered 'Blessed are they who expect little.'

'It was the very loveliest experience I've ever known,' said Betty. 'And, look here, I do think *Facilis Descensus* would be such a splendid name for your next balloon,' she added maliciously.

We offered them bath-buns, and the 'fourth' said facetiously that he would 'barter his soul for a bath.' Truthfully, I have never seen two people look warmer.

Bob had ordered that the motor was to follow us if possible; but as we were at least fourteen miles from the given point we gave up hope of its arrival. It was four miles to the nearest station, and either a question of walking or sitting on the débris of the balloon, which now reposed in an enormous farm-cart, looking like a neat washing-basket and two canvas bundles. We chose the latter alternative, and, to the huge amusement of the crowd, we were hoisted in and started off at a slow, bone-shaking jog. Oh, that drive! To those in need of vibratory treatment, whose teeth are their own—not otherwise—let me strongly recommend this mode of progression.

The worthy driver looked upon us with the interest he would have bestowed on Martians or animals escaped from the Zoo, and drove his sturdy tandem with his back to them, and an utter disregard of others on the road, while he kept up a running flow of partly unintelligible conversation. 'I see'd yer a-comin' down,' he observed. '"Come on," I says; "I'll give yer a drive to town."' I'm sure he was priding himself on having hastened our descent by this munificent offer. A halt was voted for unanimously at the first public-house, where, still seated aloft, we quenched our thirst to the accompaniment of more cheers.

'Like to pull up again at the next pub?' asked our Jehu.

The rest of the way to the station was a sort of triumphal procession; and when one youth eagerly presented his bethumbed pocket-book and implored our signatures, Betty and I felt we were indeed tasting the joys of celebrity.

Very weary, full of rarefied oxygen, but still bubbling over with our adventures and the knowledge of 'something attempted, something done,' we settled ourselves in the comfortable railway carriage bound for Liverpool Street.

'I'm getting an aeroplane,' I overheard the 'fourth' say to Betty, above the roar of the train. 'Will you fly with me?'

'I'd love to,' replied Mistress Betty demurely.

## DEFENCE, NOT DEFIANCE!

As I stood on the cliffs of Dover,
Watching the waters dance,
Watching the ships go over
From me to the shores of France,
I found I was only dreaming,
I learned that the prospect there
Was only a sort of seeming
Of things as they really were.

I saw in a sudden vision
That men were the tools of God;
That what had seemed their decision
Was done at their Maker's nod;
That the steamers were iron shuttles
Which carried an endless thread,
Working backward and forth
'Twixt the south and the north,
Or wherever the Master said.

I saw that these shuttle-steamers
Were sped by a Hand above,
And the Hand, our Blessèd Redeemer's,
Was weaving a cable of love;
That the power over tempest and water,
The push on the piston-rod,
And the drive of the steam,
Howe'er it might seem,
Came straight from the fingers of God.

And yet as I gazed I was troubled,
I still saw the waters dance,
The love-strands were still being doubled
'Twixt me and the shores of France;
But what of the roar and the rattle,
The threatening of war's alarms,
That came from the ships of battle
Which lay in the harbour's arms?

Surely these were the weapons of evil,
And never the weapons of GOD;
*Their* steam the foul belch of the devil,
*His* push at the piston-rod,
Sharp shears in the service of Satan,
With limitless license to rove
In a measureless quest,
Plying east, plying west,
To cut all the cables of love.

But no! once again I was dreaming,
Once more had my judgment failed;
Of the substance I'd seen but the seeming,
Once again was the vision unveiled.
These Dreadnoughts were servants of science,
Not thieves, but High Heaven's police,
Their motto: 'Defence, not Defiance!'
No wolves, but the watch-dogs of peace.

# THE LAST HOLE.

By ISABEL MACDONALD, M.R.B.N.A., A.R.S.I., M.I.H.

'I'M growing old.' Sometimes this most disagreeable consciousness comes at twenty-five with the appearance of the first unwelcome gray hair or the detection of just the suspicion of a wrinkle; sometimes it comes at seventy with a twinge of rheumatism, or the discovery that the stair is one of the larger undertakings of life. Ever and anon the unpleasant consciousness recurs with an increasing and irritating insistency. Yet, after all, in mere additional years there is nothing to fear. It is being cut off from active life and the lessening power to enjoy and participate with others in the affairs of the world that we secretly dread. These make old age, to some of us, seem the very abandonment of hope. Yet, if they are faced with energy and good health, they become but phantoms that recede as quickly as the years advance, and there can be no denying the fact that the greatest engineering, political, and professional successes have been achieved by those actually past middle life.

Some time ago I was seated at a window in a Fifeshire golfing town engaged in trying to fortify my brain to meet the conundrums of the Royal Sanitary Institute's examiners in hygiene. A heavy Scotch mist hung over a stern, gray sea, and the whole atmosphere made one feel one's self but a dull item in a stale and uninteresting world. My attention was caught for a moment by a gentleman coming from the links with his golf-clubs on his shoulder. Evidently he had passed the allotted span, but he had all the appearance of a still keen and prosperous business man on holiday. His brisk buoyancy at once attracted my attention. Surely here was one who had found the happiness that all the world's a-seeking. Just as he passed my window he turned a triumphant, happy, old face to his companion, and I caught the words, 'I'm so glad I won that last hole!' At the time all my energies were absorbed in the effort to master the dry details of public health work. 'The last hole' seemed such an absurdly trivial thing to arouse such excessive self-congratulation and satisfaction. Yet now, when the incident is long past, reflection seems to single my old golfer out as an object lesson worthy long chapters on hygiene. The whole purpose of the volumes of literature on that subject which are poured into our libraries every day is to teach us how to ward off disease and how to preserve a youthful vigour, efficiency, and happiness. Here was the very incarnation of that object—seventy busy years behind him and still a young man in heart! How did he manage it? He had found for himself, somehow, the whole secret that the science of hygiene is struggling to evolve.

Let us gather up some of the food for thought that my old object lesson yields. The very first glance showed that the bright colour on the smooth cheek was the result neither of any modern methods of facial massage nor of cosmetics. At best these are but a snare and a delusion; the results do not hoodwink others any more than they deceive one's self; and, after all, what matters mere cutaneous old age if the body still retains a youthful vigour and the mind its old, keen alertness? What we want is the freshness given by perfect health, of which the most ingenious treatment can but provide a poor imitation.

Let us seek more deeply for the secret of the victor of the golf-course. Somehow he reminds us of the words of Scotland's greatest poet:

> The heart ay's the part ay
> That makes us right or wrong.

There is great wisdom underlying the words from a physical, just as much as from any moral, point of view. The poet, of course, uses the word heart conventionally, but, for the purpose of the moment, we may take the statement literally. The whole health and comfort of the body are dependent upon the heart and blood supply, and, unless the latter—that ever-active carrier—is bringing to the brain

[*All Rights Reserved.*]

the unadulterated nourishment it requires, even mental work cannot be of a very high quality. Our very temperament, habit, and mental attitude are, all of them, dependent upon the condition of the blood and its circulation. Hence the need for a greater knowledge of what will keep in repair and good order that wonderful living machine, the human body, which responds so truly to every condition to which we subject it for good or for ill.

We might with profit give some attention to the mental habit of the worthy of the golf-links. Notice that he took his relaxation in a keenly interested and whole-hearted way, yet he could stop even when his enjoyment was at its height. His purposeful step seemed to tell one that he would enter into his next occupation with the same zest, whether that might chance to be his correspondence, his newspaper, or maybe—his lunch. We have no indication of what might be his theories on diet. Very likely he scarcely knew that he had any; but we may take it that, just as he could leave his game at the right time, so also would he leave his dinner-table when he should.

Among the less energetic type there is still something of a tendency towards overeating. In the days of our grandfathers the hospitality of a host was gauged by the number of guests who were under the table at the end of the feast. Nowadays, if the red wine does not flow quite so freely as of yore, we have with us still those self-constituted martyrs who manfully test to the utmost limit of digestive tolerance the resources of their friends in procuring what are, sometimes with a very doubtful wisdom, spoken of as 'the good things of life.' It has been said that many of us dig our graves with our teeth, and there is undoubted truth in the statement. The hardening produced in the arteries by overeating is one of the commonest diseases of those who are getting old in years. Such an arterial condition affects comfort and happiness to a wonderful degree. The efficiency of the brain is interfered with; the heart, muscles, and all organs of the body suffer. Energy and adaptability for work, with all our pleasure in it, are more or less lost. Arterial hardening produced by overfeeding is a common cause of apoplexy and many other disturbances. Much might be done by moderate and sensible dieting to keep old age at bay, and many people condemn themselves to a course of slow poisoning through continued indiscretions in this respect.

To quote the spirit, if not the letter, of St Paul, the best advice that can be given with regard to the preservation of health is, 'Be moderate in all things.' Exercise, for instance, is all very well, but when it is long continued it produces materials more or less poisonous in their action on the body.

Another important observation which we make with regard to the mental attitude of the lad of seventy is that his mind dwells on the bright side of things and forgets all regrets and disappointments. He was '*so* glad that he won that last hole.' Apparently he had lost at least eight, and, it may have been, the whole of the previous seventeen. In his cheery optimism he is not unlike a certain dear old lady who had only two teeth left and was so thankful that they were opposite.

Smile, if you will, at the foibles of the kindly optimist, but there is not a doubt that he possesses one of the best means of postponing old age. Scarcely anything can hurry its approach more than a habit of brooding on the slights and misfortunes that are, more or less, the lot of every one of us in our journeying through life. A mental habit of bidding dull care begone has a wonderful effect in retaining a young head on a pair of old shoulders. Even at threescore years and ten there is nothing to be gained by living for a day that is dead while yet one remains of life. The dreary 'what might have been,' faced among the shadows of remorse and regret and allowed to absorb our mental activities, has a most degenerative effect on the brain. Let us meet life and its actualities with something of the unconcern of the worthy lady with, or rather without, the teeth, realising that a habit of meeting trouble half-way means meeting old age half-way as well.

Some of us have known a sweet girl of eighty who, sitting or walking, holds herself erect, whose eyes are ever bright and interested, who is fastidious as 'sweet seventeen' in regard to her dress, and who has an old-world beauty all her own, which the artist loves to delineate. She has a keen sense of humour still, and you are sure of enjoyment when you visit her. She never broods on the perplexities and disappointments of life; these are systematically banished from her horizon. Young in heart, she prefers the society of the young to that of the middle-aged and old. The bore, as well as any unsavoury or uncharitable topic, is promptly waved aside. Bright, young, and happy at eighty, she is, in her own way, an object lesson as fascinating as the buoyant old victor at his last hole.

This is all very well, you may argue, but is their optimism not, after all, merely a matter of individuality? A man or a woman, you say, has not the power to choose a temperament, phlegmatic or sanguine, as the case may be. The answer must be both yes and no. Most assuredly we all possess traits inherited from the habits of our particular ancestors—tendencies inclining us to indolence, self-indulgence, worrying, brooding, or, it may be, hatred. All these have their part in making us 'old at forty.' Doubtless, too, instincts of a beneficent kind are derived from the men of an olden time who to some extent are living again in us; but, nevertheless, we are all more or less the architects of our own character, and, in carving this, my two old object lessons shed a certain glimmer of light. If we follow in the track of their cheery

optimism, rather than in the current of nervous rivalry that characterises the age, we, like them, may find something of the secret of perpetual youth, and cause a coming generation to reap in the future a great harvest from our honest endeavour.

# LAURISTONS.

## CHAPTER XXV.—HOW THE GREAT GAME WAS PLAYED.

THIS first visit to Ealing after the cataclysm was admixed sweet and bitter to him. But he said to himself that each time he came he would find it easier to get back to the old footing, not perhaps as yet realising to the full the deadliness of the self-inflicted blow from which he suffered and must suffer.

At the bank matters rolled on smoothly and without a hitch, thanks to his and John Sax's infinite care and minute and ceaseless watchfulness of every slightest detail. If carefulness and caution could carry them through, of a surety there would be left no loophole for disaster.

But it was a wearing fight, and many a time Charles Lauriston came up from it inwardly bruised and blackened, his whole truer nature wrung with anguished repulsion at the necessities of the case, and bitterly regretful that he had not let everything go and kept only his honour.

And yet thereupon at once would come the thought, 'And if you had, how would it be now with all those who have trusted your house?' and he would set his teeth and tighten his heart, and with a quiet face straighten himself under his burdens again.

His assiduity and keen concentration won him golden opinions in business circles. Personally he had always been much liked for his genial bearing and frank courtesy. The slight stiffening he now underwent was looked upon as the natural consequence of his loftier position and weightier cares and duties, and none found fault with it. John Sax attended him, as he had attended Sir George, and all the threads and fibres and far-reaching tendrils of the house's great operations were tended and controlled by them with the most perfect unanimity of purpose and understanding.

Nothing was ever left to chance, so far as it could possibly be foreseen, and the great and ever-increasing operations of the house rolled on, smooth and deep, like a mighty river beneath whose placid flow may lie unsounded depths of mud or gold, and tragedies of broken hopes, and dead men's bones.

The house worked through a vast army of instruments and sub-instruments, many of whom had no knowledge of whom they were in reality working for or whither their operations tended. They bought or sold according to their instructions, and very frequently against their own short-sighted ideas; but they were only pawns in the mighty game, and the heads that decided the moves were those of John Sax and Charles Lauriston in the private room at the bank.

It was a mighty game of skill and far-reaching forethought, from which the element of chance was eliminated so far as knowledge and prevision could oust it. But, since its calculations were necessarily based on human affairs, Chance must still have her finger in the pie.

Charles Lauriston threw himself into it all with whole-hearted zeal, with the work-hunger and tireless energy of the captive who discovers a loose stone in his prison wall, and forthwith savours the freedom that lies at the end of the tunnel yet to be made. He had implicit confidence in John Sax, the confidence John Sax instilled in all who knew him.

And Charles Lauriston found the mighty game enthralling. Even the great game of war, as he had experienced it, was a tame thing in comparison. But when he staked his life his honour was clean. And now! He was prisoner to dishonour, tunnelling to light and freedom with all the powers that were in him. His tools were of base metal indeed, and not to his liking, but he was in chains and had no choice; he must use them or give up the struggle. And that he never dreamed of doing, for he had utmost faith in John Sax, and John Sax had said that redemption was possible.

---

## CHAPTER XXVI.—HOW THE SHADOW FELL ON LADY CHARLES.

AUNT CHARLOTTE and the Marquis de Montessonne were quietly married three months after Sir George's death, and took up their residence with Sir Charles at the great house in Grosvenor Place. It was the most natural and convenient arrangement possible. The house was large enough to accommodate half-a-dozen families. Monsieur and Madame de Montessonne looked hopefully forward to returning to France the moment Bonaparte should make that inevitable false step which would roll him in the dust. And it suited them well not to have to set up a temporary establishment of their own. Then, too, it assured to Sir Charles the comforts of home and such society as he might desire while Lady Lauriston remained in the country. He had his own rooms; monsieur and madame had theirs. They met at dinner, and sometimes spent the evenings together, but all were free to come or go as they chose.

The ten thousand pounds promised by Sir George towards the National War Fund had been promptly paid, not without an internal wince on Charles's part at the irony of the whole proceeding. But it had so undoubtedly set the pace which resulted in a six-figure subscription that Mr Pitt, as an earnest of his gratitude, sent Charles the offer of a peerage, a visible mark of honour which his innate honesty would not permit him to accept.

'Time enough for such things when the devil is laid and the world itself again,' he said to the hard-worked young Chancellor.

And Mr Pitt thought he referred to *his* special devil, Bonaparte, and liked him the better for it. But 'devil' is a wide and comprehensive term, and most men have their own special foes for the bringing out of their fighting-powers, and we know what Charles Lauriston's were, and what he meant.

After the bitter stress of the first few months Sir Charles grew more like his former self again, though less given to the light-hearted enjoyment of life, and of a graver mien, as became the head of the house of Lauriston. To the children he was, with differences which tended to the curtailment of their former full enjoyment of him, very much as he used to be. To his wife he was all that was loving and tender and considerate.

Each week, when they met again after the few days' absence, his eyes sought her face eagerly for additional signs of returning health; and hers sought his no less anxiously for signs of additional burdens.

But he made it a custom now, whatever the weather or the state of the roads, to take a circuit for the benefit of the ride and the shaking off *en route* of some of the anxieties of life, and he generally came in upon them with the glow of the road in his face and in fairly equable spirits.

One time he came in very late, and Lady Charles's anxiety had deepened into such gloomy forebodings that she hardly slept a wink that night, and was the worse for it. And when he did come he was soaked to the skin by a sudden thunderstorm which he would have escaped if he had arrived earlier; but he was in unusually good spirits, though his clothes were steaming on him, and he had a bullet-hole in his hat and two strange pistols in his pocket.

He told them all about it over the dinner-table, and was more like his own old self than they had known him since Sir George's death. He had come by the Edgeware Road and Harrow weald again, and just after leaving the main road had been suddenly confronted by a highwayman.

'Such a specimen!' he recounted with enjoyment. 'I saw at a glance that he was but an amateur, so I just went straight for him with my hunting-crop. I always thought it might come in handy on some such occasion. His pistol went off in his fright, and then I knocked it out of his hand and him off his horse, and stood over him. He was very much upset at such a turning of the tables. I plucked the bit of crape off his face, and it was not at all a bad face; and I let him get up, and made him tell me all about it as we stood under a tree for shelter. He was a young Irishman, in the horse-dealing line, he said; and, wanting to get home to Ireland, and being without money, he took to the road to get it. This was his very first attempt, and he acknowledged he had made a mess of it. "Sure'n I was meant for an honest man, yer anner!" he said. "An' 'twas only the ill-luck druv me to it. If yer anner'll let me go this time I swear I'll play the game no more. An' I'll pray that when yer anner's own tight time comes ye'll get off as aisy as yer anner'll let me off this."'

'And what did you do, daddie?' asked Mavie, all eyes and ears.

'I made him give me his other pistol, and told him to go, and be thankful; and I don't know when I saw a more grateful face. And when he'd got on his horse, and had told his thanks as an Englishman couldn't tell them if he tried for fifty years, and was turning to go, I called him back and gave him ten guineas to help him on his way.'

'I'm so glad!' said Mavie all a-sparkle. 'What did he say?'

'He looked at me for a minute as if he were not sure I meant it. Then he put his hands over his face and blubbered like a schoolboy.'

'Girl!' corrected Charles promptly.

'And I rode away and left him.'

'That was brickish,' commented Charlie with gusto.

'I hope he won't set on any one else,' said his mother.

'He won't,' said Sir Charles with conviction. 'He'll get across home, and I don't believe he'll be any the worse for it—maybe the better. And he might have gone to the gallows!' he added musingly.

'I'd sooner think of him galloping away to Ireland,' said Mavie. And upon that they were all of one mind, except Jerry MacClootie, who strenuously held, when informed of the matter, that the master ought to have blown the scoundrel's brains out with his own 'pishtols.'

But this little matter had results, as the smallest matters in life have; and the first of these was that the master caught a feverish chill from his soaking, and slept ill that night.

During his wife's illness, and ever since, he had occupied the room adjoining hers, with the door between them open, so that in case of need he could be at her side in a moment.

The morning after his encounter with the highwayman there was that in her eyes that had never been there before. She did her best to hide it, but he caught a glimpse of it, and rallied her again on her last night's fears for him.

'What has been may be,' she said quietly. 'I shall always have a little fear for you now, Charles.'

'Oh, but you need not, my dear,' he said quickly. 'The gentlemen of the road want only a man's money, not his life. My Irish friend's pistol went off quite by accident. If ever I am confronted by

superior force I promise you to knuckle under at once, and run no risks.'

But she shook her head. 'You would ride straight at them as you did at this man, and the end might not be so happy. I know you too well. If there is danger to be faced, you will face it.'

'It would be against the grain not to, but for your sakes I will promise to lie down like a lamb if the danger is obvious.'

'I pray God to deliver you,' she said quietly but with more feeling than the circumstances seemed to call for.

He remembered it long afterwards.

---

### CHAPTER XXVII.—HOW THEY FOUGHT AT WESTMINSTER, AND MAVIE PRICKED HER FINGERS.

THE three boys were back at work, not at Mr Wrather's, but at Westminster School in Dean's Yard—Charlie, as a matter of course; Etienne, because his grandfather, being now a man of means once more, was determined that he should lack nothing in the way of preparation for the position he would some time be called upon to occupy; and John Sax, because the Lauristons never forgot, and Sir Charles had undertaken the matter himself.

Mavie, to her great disgust, was entered as daily bond-slave to the polite accomplishments at the establishment of the Misses Blenkinsop, in the old red-brick house facing on to Ealing Green, not far from Mr Perceval's.

The boys, especially Etienne, found the change from the comparative backwater of the Reverend Mr Wrather's to the turbulent ocean of Westminster no small ordeal.

Fagging in those days was no child's-play. The boys of the lower school were up at six in summer and seven in winter, drawing water from the pump in Dean's Yard, lighting their tyrants' fires, preparing their breakfasts, brushing their boots and clothes, cleaning their dishes and cooking utensils, and were kept from any stiffening of the joints through the day fagging at fives or cricket, and running errands in bounds and out.

At all such menial duties Etienne's aristocratic soul was in a state of furious and unceasing revolt.

'But, *mon dieu*, I am not a servant!' was the constant burden of his short-cut expostulation.

'Oh, you ain't—ain't you? I'll soon show you, my son. Take that—and that—and that! And don't you mong-jew me or I'll knock your silly head right off, you beastly little Parlyvoo. Call that a polish? Now!' dancing on the row of boots which Etienne's unfamiliarity with the business had tendered as cleaned. 'You do 'em all over again, and shine 'em so that you can see your ugly little mug in 'em, or you'll go on doing 'em till you can!'

To a De Montessonne, even after lean years of exile in Queen Street, treatment such as this was torture absolutely inexpressible. But there was no escape. It was the custom of the school, and had to be lived through as philosophically as might be.

Charlie and John Sax scuffled through their dirty work with such equanimity as they could muster from the thought that their own time would come, and managed to extract such meagre enjoyment from life as was permissible to a lower-school boy in those days.

But Etienne lived in an atmosphere of constant disgrace and perpetual lickings, and, with the exception of Charlie and John Sax, it is safe to say that he heartily hated and despised every single boy in the school. His own special tyrant was Lord Iver, who later on, as Earl of Ruislip, became a mighty warrior and one of the finest cavalry leaders of his day. Even as a boy his ideas of discipline were of the strictest—that is, when he himself was the disciplinarian—and his desire for spick-and-spanness stuck to him through life. Etienne never forgot or forgave him, though the treatment he received differed in no respect from that meted out to the rest. It was the same among his fellows of the lower school. Points of contact there were in plenty, but no assimilation. He regarded them as brutal young ruffians. They looked on him as only half a boy, and a Frenchman at that. Down at Ealing one Saturday, as they stood on the terrace overlooking the paddock, he wildly petitioned his grandfather to remove him from the place, which he succinctly described as 'frightful hell.' But the marquis knew the kind of men turned out by such 'hells,' and estimated them more highly than the Jesuit-manufactured article of his own country.

'It will do you a world of good, my boy,' said the old gentleman, as he took a very elegant pinch of snuff from a new box, in the lid of which was a miniature of King Louis XVI. ringed with rose diamonds; and he looked over the snuff and the box at Etienne as if he were a new and not too pleasing specimen of an inferior race—'a world of good!'

'But you do not understand, then, monsieur,' asserted the surprised Etienne, who had looked at least for sympathy. 'I black boots! I clean grates and gridirons! I brush dirty clothes! I cook messes—I, Etienne de Montessonne!'

'I am sorry—for him for whom you are supposed to do these things,' said the marquis quietly. 'He must suffer horribly.'

'He!' cried—almost screamed—the surprised Etienne. 'It is I who suffer! He beats me!'

'I shall send him a guinea, with my compliments, and beg him to continue. You must learn to suffer in silence, my boy. All these things that trouble you so I have done, and, *mon dieu!* he for whom I did them suffered too.'

'Did he lick you?' asked Etienne, interested out of himself for the moment.

'The world had already licked me. It is better to bear the yoke in one's youth. So one may become a man. Otherwise one is like to be but a coxcomb.'

'All the same,' grumbled the small boy, with a scowl on his peaky face, 'it is not too pleasant.'

'How do these others get on?' with a jerk of Louis XVI. towards Charlie Lauriston and John Sax, the latter of whom had just come ungracefully over the head of a wild black colt amid the derisive laughter of Charles and Mavie.

'They hate it too.'

'But they never say so, and they are wise. Now, no more! Set your teeth, my boy, and bear it, and it will make a man of you.—Stick to him, John Sax! Grip with your knees! A guinea if you ride him round the field!'

'And me!' 'And me!' 'And me!' from Charles and Mavie and Etienne eagerly.

'Yes, a guinea to each one who rides him round the field. But—you, mademoiselle? You can't ride him barebacked?'

'Can't, I then? Just you wait and see, monsieur!—Come on, John Sax. Either get him along or get down and let us have our turns.'

'I don't know what he's going to do,' said John Sax, precariously up aloft, while the black colt planted his forefeet like rocks, and dug down his head, and showed the wicked whites of his youthful eyes, and refused to budge an inch.

'I'll start him for you;' and Charles brought his switch down on the black one's quarters, and dodged out of the way of his heels as John Sax landed on the grass in front again.

'My turn!' cried Mavie. 'John Sax, you're the funniest funny I ever did see when you come waterfalling over his head like that. That's three times you've done it already.'

'He's so slippy,' said John Sax, disgusted at his own performance.

'Give me a hand, John Sax;' and he cupped his hands for the little toe, and she scrambled up, flung her right leg over the other panting black side, dug in her heels, and hanging on to the halter like grim death, rode the black one round the field in style, while the marquis and the boys applauded vigorously, and John Sax felt very small indeed.

Charlie and Etienne won their guineas also, and pocketed them appreciatively.

'I'm going to try again,' said John Sax, laying hold of the halter as Charlie jumped down.

'You'll only tumble off again, John Sax,' shrilled Mavie, dancing at the prospect.

'If you can stick on I ought to be able to;' and he flung himself at the slippery black back and wriggled over into his seat.—'Don't you whack him, Charlie. Leave him to me.'

But the black one knew the unaccustomed rider at the touch, and started his tricks at once. He bucked and danced, down head, up heels, while little Jack up aloft swung impotently like a half-full sack, and presently came to grass in the usual graceful curve, and Mavie stopped her dance of delight to bend double with shrieks of laughter.

'Oh, John Sax, you'll be the death of me! Why *can't* you stick on? Oh, *don't* try again! It's not a bit of use, you know.'

But John Sax was already scrambling up again; and the marquis, watching him quietly over a suspended pinch, nodded his head to himself, and said, 'That's the kind of boy their fagging schools turn out. They never know when they're beaten.'

And that time little Jack hung on, and the black one could not get him off with all his tricks and hardest trying, and when he came to the marquis to claim his guinea the marquis gave him two.

If their days at school had their elements of bitterness, those blessed days when they 'went home' were full of compensation, and took on keener edge of delight from the duller times between. And the very best days of all were those they spent at the red house on Castle Bear Hill at Ealing.

Charlie came off best at school without a doubt. There was something so taking about his cheerful face and frank, hearty ways that he made friends everywhere and at once. Even his special tyrant was on as good terms with him as an upper-school boy might reasonably be with a lower, and he was so quick at learning that even his masters eyed him with approval.

John Sax—Jack Sax—Jassax—Jackass—it was inevitable, but not unalterable, and many a bloody battle little Jack fought before he succeeded in establishing himself as Jassack, and the clear understanding that any lapse into the less polite pseudonym meant instant warfare. But they liked him none the less for it, and out of his battles many a warm friendship grew and lived.

But custom failed to inure Etienne to the drudgery and—as he esteemed it—the degradation of fagging. He never ceased to kick vigorously against the pricks of usage, and, when it came to a struggle, against the shins of his many tormentors; and both these indulgences were condemned as un-English and necessitating continuous chastisement.

Jack and Charlie did all they could for him. They reasoned with him, fought for him on occasion when the provocation seemed to them to justify it, threatened him, and licked him more than once on their own account in the endeavour to drive sense into his head. But it was all labour in vain, and at last they had to leave him to his cheerless lot.

'What *can* you do for a fellow who can't use his fists and will use his feet?' asked Jack of Mavie one day down at Ealing.

'Punch his head,' said Mavie cordially.

'We've done that over and over again, and it don't do any good. *I* don't know what's to be done with him.'

'I should leave him alone, and let the others knock it out of him.'

'I s'pose we'll have to. But it's miserable seeing

him always catching it; though, to be sure, he generally deserves it.'

So they gave him up in despair, and Etienne had ill times of it.

In his classes he took fairly good positions, and in French he was of course always top, whereby he won much contumely from his fellows. Indeed, his unavoidable proficiency in his own tongue was a standing reproach and a quite sufficient reason for a punching when no other obtruded itself past bearing-point.

Little Jack was never a brilliant scholar. He never took much of a position in any of his classes except in French, and that, of course, came of his many years' close intercourse with Monsieur de Montessonne and Etienne, and he could not help it.

But he slogged at his tasks as he slogged at the fellows he fought, and was as surprised to find them turn into friends when he had downed them as he was in the case of the more human foes whose onslaughts were so much more to his liking.

But what John Sax learned he learned once for all. There was no 'in at one ear and out at the other' with him. And, still better, he learned how to use his brain, and so got his sturdy feet on to the great high-road of knowledge and understanding.

And Mavie, meanwhile, was fighting her own little battles on the very much smaller and much more polite plane of the Misses Blenkinsop's academy in the square, red house near Mr Perceval's on Ealing Green.

*(To be continued.)*

# THE BODY'S GROWTH.

## SOME INTERESTING PHASES.

IN one of his ironical moments Hazlitt has written, 'If you do not know the muscles by the help of which you walk, how is it you do not fall down at every step you take?' The paragraph in which this sentence occurs was written by Hazlitt to emphasise the importance of intuition as contrasted with reason in the general conduct of life. But there can be little doubt that a scoffing sentence of a similar sort might be written to indicate the attitude of mind that most people adopt towards what is supposed to be peculiarly scientific information. It is indeed remarkable how very reluctantly scientific knowledge is adopted as a factor in their mental development by those whose education does not terminate abruptly when they leave school. The changes that have been introduced into our methods of education, as a consequence of more enlightened ideas regarding the art of teaching, have not been altogether free from mistake; and even the present generation stands under the reproach of Herbert Spencer, who declared that 'men who would blush if caught saying Iphige'nia instead of Iphigeni'a, or would resent as an insult any imputation of ignorance respecting the fabled labours of a fabled demigod, show not the slightest shame in confessing that they do not know where the Eustachian tubes are, what are the actions of the spinal cord, what is the normal rate of pulsation, or how the lungs are inflated.' But probably the diffidence with which a layman approaches a subject of a scientific nature is a result of that strange and formidable vocabulary that necessarily grows around any specialisation of knowledge; and had these notes been entitled 'An Outline of Postembryonic Ontogeny' I question if any editor of a general magazine would have deigned to consider even the first of my sentences.

I have chosen the simple title above, not as a subterfuge to lure the editor, but as an indication of the manner in which I propose to relate a few of the changes that take place in the human body in the course of its growth towards maturity. Certain of these changes are of great interest to the general reader, and it is my aim here to give a short account of them in ordinary language.

Many readers of this article will be able to recall to mind that masterpiece of ancient statuary, the Group of the Laocoön, where a father with his two sons is crushed to death in the folds of two gigantic serpents. To judge from the difference in height between the father and his sons, the figures of the latter are meant to depict mere boys. Yet there is nothing boyish about the figures. They are only diminutive men, and one receives the impression that the master who gave this wonderful group of statuary to the world was in the habit of thinking of children as men in miniature. But even those who realise that a man or a woman is not merely an enlarged child seldom appreciate fully the extent to which the growth of the body is a process of metamorphosis. In respect of at least one organ, the mature individual has lost something of the physical endowment with which he entered the world. When a child is born its little chest contains a bulky organ of which grown men and women can show but the merest trace. It is the thymus gland; it lies just over the heart, and is a double-lobed body of a pinkish colour. In a baby this gland is generally large enough to extend from the heart up to the neck. When the baby has completed its second year the gland begins to diminish in size, and continues to shrink gradually but slowly. During childhood the thymus remains a gland of some size, but it meets with misfortune about the age of thirteen or fourteen. At that age it begins a rapid career of degeneration; and, although it does not disappear entirely, it is represented in an adult by an insignificant remnant.

The thymus gland is an instance of *absolute*

diminution in the bulk of an organ with the passing of the years. But during the body's evolution towards maturity instances occur of *relative* diminution in size, and of that phenomenon the liver is perhaps the most interesting example. The liver of a full-grown person generally weighs about three pounds, and as a rule an adult weighs about forty times the weight of his liver. But the liver of a newly born baby is *relatively* a bulkier organ. So large is the liver of an infant compared with its tiny body that one may safely say its whole body-weight is seldom more than twenty times that of its liver. This disproportion is still more remarkable when we bear in mind that a baby is normally fatter than a man. A baby is, in fact, a very corpulent person; and if we remained as obese throughout our lives as most of us were when we set out on our careers we should indeed have fat men about us, if not 'such as sleep o' nights.' The plumpness of a baby is not without meaning. It recalls the far-away epoch in the history of our race when the vicissitudes of early life were even greater than they are to-day, and only that sort of baby that came into the world with a good reserve of fat would be proof against the troubles that beset the first years of life. Where babies are born into a community that rejoices in a profuse supply of patent foods an abundance of fat is not of such paramount importance; but from an æsthetic point of view the chubby baby will continue to command our admiration.

In any case, it is certain that our ideas regarding the correct proportions of the human body will always place upon our babies the duty of hastening to increase the length of their legs. It is known to the privileged who have beheld a newly born child *en déshabillé* that the little legs are very short in proportion to the length of the trunk; but probably the very observant are the only ones who know that a baby's legs measure but one quarter of its length, whereas a man that has grown to maturity owes one-half of his height to the length of his legs. But, even in the interval that elapses between birth and the first attempts to walk, a baby will reduce this disproportion to a very considerable extent. Indeed, a rapid growth of the lower limbs is a feature of early life; and a child of three is already half as tall as it is ever likely to be.

During the years of childhood boys and girls increase their height at the rate of two inches each year; but this rate of increase is subject to variations according to the season of the year and to many other conditions. The greatest variation of this rate of increase occurs at fixed and definite periods for each sex. In the case of girls the eleventh year is generally a year of sprouting, and a little more than two inches is usually added to the height. This annual rate of increase may be continued until the fourteenth year, and from that year to the seventeenth the annual increase is comparatively little. It is very seldom that a girl adds anything to her height after the seventeenth year. With boys the sprouting period is generally postponed until the fourteenth year, and it lasts with them until the seventeenth year. During these three years two and a half inches are often added to the height each year, but after the seventeenth year the annual increase is seldom more than a quarter of an inch. The twentieth year or the twenty-first is, as a rule, the last of the years in which youths may add to their height. Although the 'dates' of these changes are remarkably universal, these measurements, and also the ages that have just been mentioned, are of course subject to slight variations in different individuals; and this remark will apply to any 'dates' that may be mentioned in the following paragraphs.

In the remarkable growth of a child's lower limbs the thigh is the segment that grows most rapidly, but in the case of the upper limbs it is the forearm that is most active in growth. From an æsthetic point of view this needs must be so; for the hand of a newly born baby is generally a little longer than its forearm. But then babies' feet and hands are always disproportionately large. If a man's feet were as long as the upper part of his arm we should count him a man of very large feet. Yet careful measurement reveals the fact that the feet of most newly born babies are just about as long as their upper arms. If a mature man wishes to realise the changes that have taken place in his proportions since babyhood, he may contemplate his shapely figure, and safely say that his legs are five times as long as they were to start with, but his hands are only three times the length of his baby-hands.

All increase in the bony framework is brought about by a process that is somewhat involved. The process is one in which bone gradually takes the place of gristle, and this conversion of gristle into bone goes on very generally throughout the skeleton. But an exception exists in the case of the bones that form the skull and most of the bones of the face. The skull-bones and many of the face-bones are not formed from gristle but from fibrous membranes. So it comes about that when a baby is born its cranium is not formed entirely of bone. There are six distinct islands of membrane on the head of a newly born child, and it is only in the second year of life that bone replaces these areas of membrane. The largest boneless area can be felt on the top of any tiny head that is less than a year or eighteen months old; and frequently a line can be felt running straight down the forehead where the two portions of bone have not yet fused into one; a line that is sometimes palpable throughout the whole of life.

There are few structures in which the adult differs from the infant more than in the skull. It is obvious to everybody that the skull of a baby is exceedingly large in proportion to the size of its face. But the differences between the immature skull and the skull of a fully grown man are far too numerous and too intricate to deal with here in detail.

It is, however, worth while to mention one or two characteristic differences between the skull of an adult and that of a child. One sometimes speaks of the forehead and the brow as though the words were synonymous. General usage knows no difference between the forehead and the brow. But probably the English word brow was originally applied only to the prominent ridge over the eyes. The Miltonic Satan, who 'with contemptuous brow' addresses the Angel Gabriel, makes us think, not of a wrinkled forehead, but of the elevated eyebrows that produce a look of contempt. At least, to the anatomist, there is a difference between that part of the skull which lies just over the eyes and the rest of the forehead. In many well-developed men it can be observed that the part of the forehead immediately over the eyes is characterised by a distinct slope for about half an inch. This obliquity is caused by the formation of air-cavities in the bone. These cavities are less developed in women than in men, and the absence of this slope gives the foreheads of women a 'nobler' aspect than those of men. But we are not born with these cavities in our skulls. A child does not show them until it has entered its second year, and during childhood they develop but slowly. About the fifteenth year they increase more rapidly, and they continue to enlarge for many years, so that in advanced life they are sometimes of considerable size. Air-cavities are formed also in a bony prolongation of that hard lump which everybody may feel behind the ear. This bony prolongation is taking shape about the fifth year of life, and the air-cavities make their appearance in it during the eventful fifteenth year.

Alterations in the skull naturally suggest questions regarding the growth of the brain. The period of life in which the brain adds most to its weight is between birth and seven years of age. From seven to fifteen the brain still adds to its weight, but at a slower rate than during the previous period. From this period of life the brain increases its weight but slowly. Still, in most cases the brain does not attain its maximum weight until the age of forty. After forty the brain loses about one ounce of its weight in the course of every ten years; but this loss of weight is not directly associated with any loss of intellectual strength.

The careful reader must have observed how frequently it has been necessary to mention the period of life about the fifteenth year in connection with changes in the body. These profound changes are heralding the approach of that period when parentage becomes a possibility. It is as though the body, hitherto concerned in knitting itself more firmly together, were beginning to realise that such a thing as parentage exists, and that it is an affair of some importance, requiring considerable preparation. Only those who are accustomed to think of the human body from a biological point of view can fully realise the amount of preparation it makes for the gallant time of courtship. The first inclination to go a-wooing generally asserts itself, more or less modestly, about the age of sixteen. When referring to the effect which this event has upon the growth of the body, the German biologist Haeckel writes in these terms: 'It is one of the chief mechanical causes of the highest development of life, and throughout the whole of nature the greatest effects proceed from this very small cause.' This period in the life of the developing organism is characterised by changes of great interest; but, with the reproving countenance of the editor ever present to one's mind, one dare not occupy more space than will be required to explain the 'breaking' of a boy's voice about his fourteenth year. The voice, as everybody knows, is produced by vibrations of the vocal cords. The cords extend from before, backwards, inside the larynx. The larynx or voice-box is composed of several pieces of gristle connected by small muscles. The two largest pieces of gristle can be seen in adult men projecting from the throat as Adam's apple. It would prolong this article unduly were I to enter in detail into all the changes that take place in the growing larynx while the voice is developing from the high-pitched squeak of the infant to the sweet tones of a woman's voice, or the deep, loud voice of a man. I am at present concerned only with the change from the 'childish treble' to the 'big, manly voice;' and it will suffice if I remind the reader that the pitch of the voice depends upon the length of the vocal cords (the longer the cords are, the lower is the pitch), and that the length of the cords depends upon the distance between the back and front of the larynx. It can, then, be easily understood that the pitch of the voice ultimately depends on the growth of the pieces of gristle forming the larynx. Now, the growth of these pieces of gristle is not uniform throughout life. Between the seventh and the fourteenth year the larynx grows but very little. About the fourteenth year the pieces of gristle suddenly throw off their torpor and begin to grow with astonishing rapidity. So rapid is the growth of a boy's larynx at this period that the unfortunate youth is taken quite unaware. Suddenly he finds himself endowed with vocal cords of a length to which he is quite unaccustomed. The nerves and muscles that move the pieces of gristle have not yet come to realise what is expected of them under the new conditions, and for a while the youth is not quite certain, at any given moment, whether the sound he is about to bring forth from his larynx will be high or low pitched. Meantime the larynx continues its growth, and by the time it has become a prominent feature of his anatomy he has learned the trick of this new instrument and begins to speak with a deep and confident voice.

It is interesting to consider why this great and sudden increase in the growth of the larynx should affect one sex only. To find an answer to this question we must look back to the rude beginnings

of human life, to the lawless wilderness where our half-human ancestors passed their lives. We must picture to ourselves the fierce and ruthless encounters with aggressive enemies that were frequent experiences of the primitive lover and primitive father. In such encounters it would be he who possessed a deep, strong voice to express his jealousy and rage who would best succeed in driving off the intruder and protecting his offspring. Thus his offspring would live to perpetuate the deep voice, and by continued inheritance fix it as a male characteristic.

There is, perhaps, no change taking place in the body during its development more reminiscent of our racial history than the phenomenon of 'teething;' but here one may give only the briefest sketch of this process. When a baby is born there are, of course, no teeth in the mouth; but they are lying beneath the gums, embedded in the jaw. Some six or seven months later they will begin to appear in the mouth. The first to appear are the central teeth of the lower jaw. A few months elapse before the central teeth of the upper jaw appear. Then there is a rest of a few months, and more teeth appear in the lower jaw, including the first molar-teeth. This process of alternate eruption of teeth and resting goes on for eighteen months, so that a child of two has a complete set of milk-teeth—ten above and ten below. This set of teeth serves the child for four years. At six or seven years of age a new tooth gradually makes its appearance behind the set of milk-teeth. This new tooth is the first of the permanent set. The milk-teeth now begin to drop out one by one as the months and years pass on, and when one sees a little boy or girl with a toothless space in the front of the mouth one may guess that the child is about six years old. The permanent teeth are constantly making their appearance in the mouth at intervals during the period between the sixth year and the twelfth year. By the thirteenth year the permanent set of teeth is practically complete; for amongst civilised races the wisdom-teeth hardly serve as teeth, however useful they may be to the negro. The wisdom-teeth may appear any time after the seventeenth year. Their advent may be postponed until the thirtieth or fortieth year, and sometimes they do not appear at all.

It must be clearly understood that I have been endeavouring to give merely an indication of the changes that take place in the body during its development. In the course of writing this article I have seen many opportunities for moralising on physical and mental education; but, remembering the space at my disposal and the scope of the matter in hand, I have refrained from any such references. The purpose of my article is served if I have helped my readers to realise that a child becomes a man or a woman by metamorphosis as well as by increase of bulk.

---

# THE MAJOR'S CLOCK.

## CHAPTER III.

'I WENT through all the disastrous, yet glorious, campaign of 1814; ay, and on the same good horse that saved my life at the Elster. I had risen to be the senior captain of the regiment, but on the restoration of the Bourbons I was placed *en retraite* with the brevet rank of major and a pension of sixty francs a month. I had no money. I was even obliged to sell my horse to a comrade, but I only did this on condition that, if ever I could afford to do so, I was to have him back. However, the case that Moyart had given me contained a splendid pearl necklace; for that at any rate I knew I should get a good amount. Whether his widow would give me back my clock was very problematical, and I did not reckon upon it; so it was not surprising that it was with a very heavy heart I wished my comrades adieu and set off for Paris. Never had the outlook appeared darker than when I got down from the diligence in the Place des Victoires and made my way to my mother's humble abode in the Rue de Rennes. But for her, I would, as many of my comrades had done, have gone off to seek my fortune in America.

'"No; madame your mother is out, sir," said the concierge effusively when I arrived. "I am sorry indeed to lose her; madame gave no trouble. She is looking for a grand house, but she will be back soon."

'I thought the worthy woman was off her head, or had had white wine; but she afterwards informed me that some rich relative of my mother had died, and that the notaries had been coming and going for the last three days; and I went upstairs to await my mother's arrival, hardly knowing whether I was on my head or my feet, and sat down like one in a dream. At one stroke all the black clouds had vanished, and I saw all the world *en couleur de rose*. Strange as it may seem, after my mother, it was my horse I thought of first. Yes, *pauvre bête*, great ugly half cart-horse as he was, I would have him back, and he should be in clover for the rest of his days. Whether I got my clock back, apart from sentiment, did not so much matter to me now, but I certainly meant to try. Suddenly I heard a light footstep on the stairs, and in a moment my mother's arms were round my neck.

'"Yes, François, it's all true," she cried after our first embraces. "I wrote to you three days ago. I sent a special messenger with the letter, but I foolishly gave him a louis, and he must

have got drunk on the road. But never mind; it is all right now."

'And she went on to tell me how she had inherited seven hundred and fifty thousand francs from a cousin who, after being nearly ruined by the Revolution, went out to the East Indies and made his fortune there.

'"Well, at any rate," I said cheerfully, "we shall now be able to keep something I have got here. Now shut your eyes and go to the glass."

'Taking the pearls from their bullet-dented case, I placed them round her neck.

'"No, no," she cried with a laugh when she saw them. "These are not for one of my age; they must be for your fiancée."

'The next morning my kind-hearted mother insisted that I should go at once to see Madame Moyart.

'"I too am a widow," she said. "It must be your first duty to go and break the news of her husband's death, and give her all his papers and valuables."

'"And get my clock," I thought, but I said nothing.

'On arriving at the house I found that it was to let, but the concierge informed me that Madame Moyart had died three months ago, and that all her money and the valuable contents of the house had gone to her brother, a Mons. Lebrune, who lived in the Chaussée d'Antin, then a fashionable quarter. This Mons. Lebrune had, on account of his shrewdness and honesty, been appointed by the Emperor to a high government post in the Hôtel de la Monnaie (the Mint), and, what's more, he had managed to retain it under the Bourbons. I was told he would be in very shortly, and was asked upstairs, where I found myself in the presence of a handsome, middle-aged lady and her still handsomer daughter. In fact, for beauty I never saw the equal of the latter; but what puzzled me was that, though a perfect stranger to both, I seemed to have met them before. I told the mother I had come on business connected with Mons. Moyart, but all the time my eyes kept wandering to the lovely girl who sat demurely bending over some embroidery beside her; this attitude, alas! giving me little chance of seeing the bright, vivacious eyes hidden away behind their long lashes. As Mons. Lebrune did not come in, our conversation gradually strayed to other subjects.

'"Though my husband," said Madame Lebrune, "owes much to the Emperor, I am very glad the latter is now where he can do no more mischief, where he can no longer make mothers' hearts ache, as he has made mine;" and she went on to tell me how she had lost both her sons within a year—one in Russia, and one in Germany.

'She still held my card in her hand.

'"Your name, unlike ours, is not a common one," she said. "In my dear son's last letter from Dresden"—and here her voice trembled a little—"he spoke often of a Captain Dorisart, and he said he hoped to introduce him to me on his return."

'Lebrune, as she had said, was such a common name that I had not thought of it before, but then it all flashed upon me. Her son was in the Genie; he was employed in reconstructing the Augustus *brücke* that the Allies had destroyed after their defeat at Lutzen. I had never met him before that time, but afterwards we were constantly together.

'"Of course, madame, I remember poor Louis Lebrune. A handsomer, cleverer, or more unassuming fellow I have seldom, if ever, met."

'"Only think of that, Henriette!" she cried to her daughter, springing up. So great was her emotion that I thought she was going to embrace me.—"I will show you his miniature; I will get his last letter.—Come, Henriette;" and followed by the latter, she hurriedly left the room.

'I had met some charming girls in my time, but never one like this. Her beauty I had seen with my own eyes. Given that she had the same disposition as her brother—which I had no reason to doubt—then indeed she was one in a thousand. I stood wondering at the luck that had brought me in contact with her, when the door behind me opened, and a rather short, debonair man with grayish hair and keen, dark eyes came into the room. I ought to have told him at once that I was a friend of his son; but he was not one who wore his heart on his sleeve, and his manner was rather brusque, that of one who was used to command; and when I mentioned Moyart's name he at once asked me into his study, where, on the mantelpiece right before me, I saw my clock. I gave him the papers, &c., belonging to Moyart, and told him how I had tried to save his life, and all the circumstances connected with the clock, and how Moyart had promised that he would return it to me.

'"Have you any papers to prove that he intended to give you the clock?"

'"No," I replied.

'"Well, then, the clock is mine, and before I give it up I will see you hung first!"

'"I have no papers to prove that he gave me a case of pearls"——

'"Pearls!" he exclaimed. "If you have any pearls of his, they also belong to me."

'"Do they?" I replied rather warmly. "Mayron, my *marshal de logis*, and some of my troopers were present when he gave me the case and heard his words. The pearls are mine, and I am going to keep them."

'We should probably, in spite of my efforts to keep down my anger, have come to high words had not his wife burst into the room with the letters and miniature in her hand.

'"Charles," she cried, "Major Dorisart is the Captain Dorisart poor Louis wrote so warmly to us about in his last letters.—I must not tell you," she continued, turning to me with a smile, "what he said about you, because if I did, it would make you vain. And see, here is the poor lad's miniature."

'Her husband at first was too astonished to speak. The grief at the loss of his only remaining son was still strong within him. The angry look left his eyes.

'"Major, I apologise a thousand times," he said in a gentle voice, taking my hand in his. "There's the clock; take it."

'"No, no," I replied, recovering my composure. "Leave it where it is at present. My good mother has come into a fortune, and she is looking for a house, and when she is settled, then we will see about it."

'Just then the bell rang for *dejéuner*. They pressed me to stay, which of course I was only too glad to do.

'Henriette at first was shy and coy, saying very little; but as the meal went on she joined freely in the conversation, her voice and mannerisms reminding me irresistibly of her brother. I quite won her parents' hearts by telling them this. No compliment in their eyes, nor in fact, from her blushes, in their daughter's, could have been higher.

'"You will come again soon?" they said as I was leaving.

'"Oh yes," I replied; "and I will bring the pearls."

'I left the house in the seventh heaven; I seemed to tread on air. My good mother, when I reached home, for the first few minutes could not make it out. The curious look in her eyes sent me into fits of laughter.

'"Is Madame Moyart going to leave you all her money?" she asked quite seriously.

'"Madame Moyart?" I replied. "*Ma foi!* no; I have not seen her. Why, poor thing! she has been dead for months. No; it's something better than money I mean to try to get;" and then I told her all.

'"Ah, girls are not always what they seem, my dear François," she said. "Men are no judges."

'This and a lot more of good advice she gave me; but when she had seen Mdlle. Lebrune she admitted I was right, and within a month those pearls were round the fair neck of Henriette, and within three we were married. A more charming and beautiful wife, as you have seen with your own eyes, no fellow has ever had; but I put all my good fortune down to the clock. If I had never had it I should never have met Moyart; and if I had never met Moyart I should never have had occasion to call upon Mons. Lebrune. So now, my friend,' he added in conclusion, 'you can understand why I look upon that lovely clock as a "mascot," and why nothing on earth would make me part with it.'

THE END.

---

# TOURING IN THE TAUNUS.

AROUND us yesterday the roar of London; to-day the peace of these woods pierced in every direction by broad paths, and mapped with colour-indications and directions by the Taunus Club. This road is lined with fruit-trees from the branch railway to the hotel, perched high among the pine-woods of the Taunus, whence we have a noble prospect which gladdens eye and heart and mind from dawn to sunset, and after dark we catch the glimmer of the lights in Frankfort-on-the-Main, fifteen miles away. The Staufen rises fifteen hundred feet behind, tree-clad to the top, with Eppstein below on the other side, in what has been called the Switzerland of Nassau. Many famous health-resorts are enclosed in the folds of these gently undulating hills. Königstein, that pearl of the Taunus, we can see, overlooked by its ruined castle; Cronberg, with Falkenstein near it—all are truly garden-towns without professing to be such. Frederickshof, at Cronberg, is a favourite resort of the Emperor, and belongs to his sister, the Princess of Hesse. Above rises the Great Feldberg, two thousand eight hundred and eighty-five feet, the highest point of the Taunus, with the observatory of the Taunus Club, and the Aldkönig just a little lower. Excursions to Frankfort, Homburg, Heidelberg, Wiesbaden, and Mainz are found easily possible. Everywhere is an air of solid comfort and prosperity, nothing mean, sordid, or squalid; constant beer-drinking, yet no signs of intoxication; and no beggars were seen until we had returned.

The Taunus is that mountainous and finely wooded region of south-west Germany between the rivers Rhine, Main, and Lahn. This region has associations with Goethe and Mendelssohn, with the Rothschilds, Bismarck, the Empress Frederick, and the present Emperor. Pilgrims from all the world now flock to the health-resorts of the Taunus. This was not the case when Major Head published his *Bubbles from the Brunnens of Nassau* in 1834. In that book he complained that of the hundreds of thousands of English, 'with their mouths, eyes, and purses wide open,' who followed each other in mournful procession up and down the Rhine, though Nassau was absolutely in their path, not more than twenty families had visited Langenschwalbad or Schlangenbad during the previous twenty years. Of all the travellers who have written on Germany, Bayard Taylor, in his *Views Afoot, or Europe Seen with Knapsack and Staff*, is one of the most pleasant and companionable. For the sum of one hundred pounds, paid intermittently, which he earned by filtering the material in this book through the columns of a New York newspaper, he had a year and a half of study and travel, and arrived in London with a franc or two in his

pocket. He confessed that the Germans enjoyed life under all circumstances, and were a much happier people than the Americans. Another American, Washington Irving, spent three weeks in Mainz, in the Hôtel de Darmstadt, and dated his introduction of *Tales of a Traveller* therefrom. In passing between Frankfort, Darmstadt, and Heidelberg, he said he 'never enjoyed travelling more than through these lovely centres. . . . I feel a kind of intoxication of thought as I draw in the pure air of the mountains and the clear, transparent atmosphere; the steady, serene golden sunshine seems to enter into my very soul.'

Bayard Taylor describes Mendelssohn, whom he met in Frankfort in 1844, where he spent the winter, as simply and negligently dressed in dark cloth, with a cravat tied loosely about his neck. His beard had evidently not been touched for two or three days, and his black hair was long and frowsed by the wind. His eyes were large, dark, and kindling, directed forward and lifted in the abstraction of some absorbing thought; and as he passed Bayard Taylor heard him singing to himself in a voice deep but not loud. Later, when he saw him in private, he was struck by the high, intellectual beauty of his countenance, his white, unwrinkled forehead, the eyes large, very dark, and lambent with a light 'that seemed to come through them like the phosphorescent gleam on the ocean at midnight.' This expression he had only seen in the eyes of men of the highest genius.

Mendelssohn was attracted by and drew inspiration from this region, which he heard of in a curious way. A travelling Englishman named Melton, called by the German narrator 'a music fool,' picked up a German named Peter, who played splendidly on the guitar and sang German songs well, especially those of Mendelssohn. They made the tour of Europe together; but when they were at the Hague, Peter fell in love with a Dutch girl and would go no farther. He secured an engagement at an hotel where Mendelssohn was residing, and interested that musical genius by his enthusiasm for Eppstein in the Taunus, where he was born. The musician begged of Peter to conduct him thither, and thither they came more like companions than as master and servant. At Eppstein, Mendelssohn drew wonderful music from a dilapidated church-organ, and, inspired by the setting sun on the woods seen from the Sun Inn, tried to set to music some verses just received. The verses the master found stilted and unnatural; Peter also disapproved, and handed him the words by Eichendorff of 'The Hunter's Farewell to the Forest,' cut from a Frankfort newspaper. Next day master and servant climbed the wooded Staufen, 'the tall watchman of the Lorsbach valley,' and lunched at the top. It was a glorious and inspiring day, with the sun trembling through the beeches and grass, making 'sunny butterflies.' Peter stood in awe and reverence, as if some sacred service were going on before his eyes, when he saw the flow of inspiration welling up in the soul of the master. Suddenly Mendelssohn leapt to his feet, exclaiming, 'I have got it!' They had a happy lunch together, and the bread-and-butter and cold meat were washed down by Rhine wine. They halted at the Crown Inn, Hofheim, on their way to Frankfort, and ordered dinner and a conveyance. Both were kept waiting, to the annoyance of the host, until the score of 'The Hunter's Farewell' had been written and signed. The manuscript was handed to Peter as a memorial of the day, along with a gold piece. That and another manuscript of the master were afterwards filched from Peter by Melton, the 'music fool,' for forty guineas. This was in 1839, but Mendelssohn paid some later visits to this region.

Eckermann, the Boswell of Goethe, recalls how he came to Frankfort in 1830, and found the air pleasant and healthy, and the water of a sweetish taste; and he praised the excellent beef-steaks and white bread. It was here that he admired the wonderful memory and agility of a head-waiter, and tried to fathom his secret in attending to myriads of guests without a single mistake. In Frankfort our party were fortunate in having the services of Dr Hülsen, lecturer on art and architecture, as guide over the old and new city. Dr Hülsen was quite young when the German Emperor asked him to accept an important post in connection with the excavations at Miletus, his report upon which is in the press. Some things that impress the visitor to this thriving and bustling commercial city are the noble railway station, the broad and handsome Kaiser Strasse, the Zeil, the handsome boulevards on the outskirts of the town, the *Anlage* marking the old fortifications (of which there is a survival of a gateway in the Eschenheimer Turn), the Opera House, and the Palm Gardens, the finest in Europe, with the monuments to Gutenberg, Goethe, Schiller, and Bismarck. At the Judengasse, No. 26 is the early home of the Rothschilds; and No. 23 Grosser Hirschgraben is the birthplace of Goethe. Other objects of interest are the Römer, with its memories of the Electors and Emperors, and its fifty-two oil-paintings of them in the Kaisersaal, beginning with Charlemagne; the Romanesque Church of St Leonard, on a site of an old castle of Charlemagne; the Cathedral, which has been burned and restored; and the old bridge over the Main, with the gilt cock on the cross, a memorial of a hostage to the devil, and a modern statue of Charlemagne close by. The Staedel Institute, Sachsenhausen, has many gems of art, including Van Eyck's 'Virgin and Child' and Lenbach's William I. In the Hotel Swan, Frankfort, at the corner of Theatre Platz and Steinweg, on 10th May 1871, the Frankfort treaty of peace was signed. In Old Frankfort we were shown over a typical house, 'The Golden Balance,' which had a roof-garden and fountain. Around the Cathedral all newly erected houses must conform to the ancient type. This has been carried out with happy results. The local poet Stolze,

who could not imagine any one wishing to be born outside this town, is commemorated by a bust over one of the city fountains. R. L. Stevenson, aged twenty-two, was in the Hotel Landsberg, and felt his money melting like 'butter in a furnace.' Accordingly he removed to private lodgings, and 'powerfully mean ones, too,' he told his father and mother, at Rosengasse 13. It was there he had the excitement of a fire at Sachsenhausen, and saw a man dandling a baby and supping spoonfuls of a slimy mixture like dead porridge.

In the Cathedral the bold and masterly historical paintings by Professor Edward Steinle are pointed out. This Roman Catholic artist had as a pupil young Frederick Leighton in 1845. From Steinle Leighton received the most indelible influence of his life. 'In a record of whatever concerns me as an artist, his name should be at the beginning, in the middle, and at the end,' was his tribute. There is a strikingly bold and effective monument to Bismarck in Kaiser Platz. While Prussian ambassador at the Diet in 1852–58 he lived at No. 19 Gallows Lane, where he made great strides 'in the art of saying nothing in a great many words.' After close attention to business he lost no opportunity of taking recreation in the neighbourhood. In one of his family letters he says: 'Yesterday I took a long and solitary walk in the hills deep into the moonlight night. I had worked from eight until five, then dined, and revelled in the fresh evening air and hilly breezes of the Taunus after I had left this dusty hole about ten miles behind me, by means of a half-hour's railway trip to Soden.' He loved the seaside at Ostend and Blankenberg, and could hardly understand why he did not always live by it, and why he allowed himself to pass 'two days in this straight-lined heap of stones [Brussels], to see bull-fights, Waterloo, and pompous processions.' The environs of Mainz he thought really superb, and at Wiesbaden contemplated the site of former follies with a mixture of 'sadness and old-world experience.' It is curious to find him swimming in the Rhine at Rüdesheim, below where now stands the stupendous national monument to Germany's unification and the close of the Franco-German war, which has his figure amongst a host of others on a panel below. In the moonlight, with nothing but his nose and eyes out of the water, he floated as far as the Mäusethurm at Bingen. 'It gives one,' he wrote, 'a peculiar dreamy sensation to float thus on a quiet, warm night in the water, gently carried down by the current, looking above on the heavens studded with the moon and stars, and on each side the banks and wooded hilltops, and the battlements of the old castles bathed in the moonlight, whilst nothing falls on one's ear but the gentle splashing of one's own movements.'

G. H. Lewes, in his interesting biography of Goethe, relates how, when the poet was recovering from his passion for Gretchen, he made walking excursions in the Taunus, visiting Homburg, Cronberg, Königstein, Wiesbaden, Schwalbach, and Biebrich, and remarks that thus he filled his mind with lovely images. At an inn in Bingen there is a legend painted up that all may read of his residence there. Regarding German poetry and music, the Countess von Arnim, author of *Elizabeth and her German Garden*, who has thrown many interesting and striking sidelights upon the character and life of the people, writes: 'Everything really heavenly in our nation, everything purely inspired, manifestly immortal, has gone not into our poetry but into our music. That has absorbed our whole share of divine fire, and left our poets nothing but the cool and conscious exercise of their intellects.'

The Goethe house, No. 23 Grosser Hirschgraben, was purchased by the Deutsches Hochstift in 1863, and has been restored to the condition it was in when the poet was born. There one can see the old kitchen utensils, furniture, books, musical instruments, and even the grandmother's puppet-show presented to the youthful Goethe. The visitor is conducted over the rooms on the ground floor, including the dining-room and kitchen. On the staircase are the Roman views mentioned in Goethe's autobiography as belonging to his father. On the first floor the three rooms toward the street were occupied by Lieutenant Torenc in 1759. The Karl August room was occupied by the Duke Charles Augustus of Weimar for some days in 1759, when visiting Goethe's parents. On the second floor, in the middle front room, is the picture gallery of the elder Goethe, arranged as in 1755. The room in which the poet was born is shown here. The middle front room on the third floor was Goethe's study. In the poet's boyhood the house commanded pleasant views of neighbours' gardens stretching to the walls of the city, and the boy never tired of watching the setting sun. A favourite walk was across the old bridge over the Main to Sachsenhausen. In the Römer he stared at the portraits of the Emperors, and was awed as he entered the chamber where they were chosen. His youthful escapades and love affairs may be followed in his autobiography.

On 28th August, Goethe's birthday, a wreath of laurel and flowers gathered from Shakespeare's garden at Stratford-on-Avon by the treasurer and guardians of his birthplace was sent to Goethe's birthplace, bearing this inscription: 'The house of Shakespeare to the house of Goethe,' and the quotation from *Henry IV.*, 'A son who is the theme of honour's tongue.'

Town-planning is now a science in Germany. Imported from France and adopted by the different states in the seventeenth century, it has wrought wonders. The most ambitious town-planning scheme is that in progress at the east end of Frankfort-on-the-Main for harbour works and industrial settlements. Here streets, railways, tramways, and embankments are being formed. The cost of the land to the municipality has been one million two hundred thousand pounds; the constructive works will cost two million pounds, and

with other items will amount to three and a half millions sterling. This is the largest town-planning scheme that is being carried out as one project in Germany. The harbour at the west end having become insufficient for the traffic, the scheme was begun at the east end on the Main, with two miles of new frontage. When the whole scheme is completed the area of the town will be increased by 50 per cent., and four out of five acres in the new district will belong to the town itself.

A well-spent day may be devoted to each of the highest points of the Taunus within our vision, the Altkönig and the Great Feldberg. The Taunus Club, with its four thousand members and forty-two branches, has a club-house, an observatory, and a meteorological station on the Feldberg, and its records are published daily in the Frankfort newspapers. A profitable and easily accomplished excursion may be made to Homburg, and thence to the great Roman camp of Saalburg, which has been restored by the German Emperor. For Saalburg we enter the electric tram at Homburg, and pass through Dornholzhausen. A bronze statue of Antoninus Pius stands at the entrance, and the general view at first is less that of ancient than of quite modern buildings. The museum is full of most interesting Roman remains—pottery, glass, horseshoes, shoes for mules and oxen, spurs, tools such as we see today (hammers, saws, axes, nails), and leather articles, of which two hundred were taken from the wells. The Romans seem to have had control of the Taunus for two centuries, and some two thousand five hundred coins from 30 B.C. to 268 A.D. have been dug up. Saalburg is one of the forts on the Pfahlgraben (*limes*) or earthen wall, which sometimes has a ditch, extending from near Neuwied on the Rhine to the Danube. The purpose of the ditch and rampart may have been to ward off attacks from the tribes of north and east Germany, and it has been pointed out that the mineral springs of Wiesbaden, Homburg, and Nauheim are all south of the earthen wall, and were known to and used by the Romans.

There was a never-to-be-forgotten walk, aided by train at Lorsbach, through the woods to Wiesbaden, with lunch on the Platte above the town, commanding a noble view of the central Rhine basin, with the smoke visible of Frankfort and Mainz. We pass the most costly memorial chapel in the world, a Greek church containing the sarcophagus of the Duchess of Nassau, the whole in marble and gold, which cost her husband, the Duke of Luxemburg, seven hundred and thirty thousand pounds. There is much to see in this gay, bright, and beautiful town, from the Kursaal to the Kochbrunnen, with its hot mineral water boiling to the surface. Heidelberg affords another pleasant day, with its ruined castle and palace of Elizabeth of the Palatinate, the University with the curious students' prisons, the Ritter Hotel with renaissance front, the evident signs of student-duels in the faces of students met in the street, and noble views of the Neckar. Mainz recalls two things: the invention of printing (as the birthplace of Gutenberg), and the liberation of trade from the exactions of the feudal aristocracy through a citizen of the town, Arnold von Walboten, who suggested the confederation of cities which led to the foundation of the Rhenish League (1247). There is a rich collection in the museum of Roman remains, found here and at Kastell, including piles from the old Roman bridge across the Rhine. In the Cathedral there is a red sandstone monument to St Boniface, apostle of Germany and first archbishop of Mainz. He was an Englishman named Winfried, from Crediton in Devonshire, and is reported to have converted more than one hundred thousand of the heathen to Christianity. The castle of Cronberg was shut to the visitor; not so the Lutheran St John's Church (1440), rebuilt by the Empress Frederick, which has a memorial to her on the tower. Two pictures in the church, one of heaven and hell, are of the crudest kind; the pew of the Empress is exceedingly plain. Cronberg and Königstein are haunted by an artist colony, and frequented as health-resorts. Quite a number of British folks now find their way thither. The groves of sweet chestnut, acacia avenues, and hill-walks are a great attraction.

Our return was by the Rhine, with a night at Bingen and Cologne, and five days at Bruges. There we were to hear of Blériot's great exploit in flying across the Channel, for which we had been in a measure prepared by the sight of aeroplanes, biplanes, and balloons, including the famous *Preussen* in the Frankfort aeronautical exhibition.

# HALLEY'S COMET.

To the Editor of *Chambers's Journal*.

GALLOWFLAT HOUSE,
RUTHERGLEN, N.B.

DEAR SIR,—I have read the interesting and instructive article on Halley's comet by Dr Roberts in your *Journal* for November 1909. I have been entertained and instructed on many subjects by *Chambers's Journal* since I first perused No. 1 (of the new series) on Saturday January 6, 1844, and no article since that date has given me greater pleasure.

From these remarks Dr Roberts may conclude I am no longer a youth, and I trust he will excuse my suggesting that there may be other causes at work than those given in the third problem for the apparent anomaly of the return years of the comet. I refer to historians' errors, clerical and printers' errors, mixing up the Julian and Gregorian calendars.

In addition, historians have no A.D. 0 year like astronomers; hence all their B.C. years are one year more than they should be, and, in one way and another, at the junction of B.C. and A.D. they have errors ranging from one to twelve years according to their requirements, as in the case of Herod the Great, whom they bury twelve years before he died!

In the third problem Dr Roberts says: 'Thus there are seventy-six years between the 1682 return and the 1758 return, seventy-seven years between the 1758 return and the 1835 return, seventy-five years between the 1835 return and the 1910 forthcoming appearance! Why should the comet sometimes take seventy-five years to go round its orbit, and at other times seventy-seven, and even seventy-eight years?' Then follows Dr Roberts's explanation; but this will never convert 11 B.C. into 10 A.D., the year of the appearance of the comet, according to my table further on.

Let us look at some examples of past history in other directions. The date of the birth of General Washington is given in one place as 11th February 1731, and in another place as 22nd February 1732. On the Knox Monument in Glasgow is recorded an important event as having taken place on 24th August 1559. For the last hundred years historians call the year 1560, and it has been proposed to make the correction on the monument, yet when the original Act of the Parliament of Scotland is examined, the date is found to be 15th December 1567, or a difference of eight years.

Eight years play an important part in the mysteries of chronology. Thus we have in 'James VI. and the Gowrie Mystery' the incident of 5th August 1600, and then the jump to 1608. Another historian—a dean in the Church—tells us frankly he has lost eight years, thus: 'This still leaves a space of eight whole years which cannot be accounted for, between Varus B.C. 4 and Volusius A.D. 4.' The cause of all this trouble rests with historians, who assume that A.U.C. 754 is the same year as A.D. 1, when the correct year is 761—an error of seven years, and the discarded A.D. 0 makes the eight years. This admits of easy proof. The Jewish Calendar on January 1, 1910, is the year 5670, or a difference of 3760; hence A.D. 0 is 3760, and A.D. 1 is 3761. The Jews reckoned their era 3000 ahead of Rome; hence on January 1 A.D. 1910 the A.U.C. year is 2670, and A.D. 1 is 761; A.D. 0, 760; B.C. 1, 759.

With these remarks on historians' errors, I now come to the point of this letter. It is known that Aristotle describes a comet which appeared in B.C. 371 (astronomers' 370), and assuming that it was Halley's Comet and would return every seventy-six years, I made the following table of years for its appearance, namely: B.C. 370, 294, 218, 142, 66; A.D. 10, 86, 162, 238, 314, 390, 466, 542, 618, 694, 770, 846, 922, 998, 1074, 1150, 1226, 1302, 1378, 1454, 1530, 1606, 1682, 1758, 1834, 1910, 1986; and I think it is not very far out.

It may interest some of your readers to note the following particulars I had calculated for A.D. 10 before I saw Dr Roberts's article, thus: A.D. 10 Julian = A.M. Julian 4018, 4010 Gregorian, 1st January, Wednesday, Historians' erroneous year A.D. 17, A.U.C. 770, Jews 3770. Full moon and passover, Thursday April 17 (14 Nisan), Easter Sunday (if it had been in use) April 20. Sunday letter E. Golden number 11. Solar eclipse, January 4, June 30, November 24, December 24; Lunar eclipse, June 15, December 10; and Halley's Comet.—Yours truly, JAMES FINDLAY.

[The Editor submitted this letter to Dr Roberts, writer of the article on 'Halley's Comet,' who wrote in reply from Lovedale on 4th December 1909: 'There is much that is most interesting in Mr Findlay's letter, and I would suggest that you publish it, not only because it is rare to have communications from so old and constant a reader, but because of its intrinsic interest. Still, in two points Mr Findlay is at fault. We do not fix the return of Halley's Comet from dates, but we fix dates from the return of Halley's Comet. We know within a fraction of a year now where the comet should appear, so accurately known are its movements and the attraction of other bodies upon it. Then again the irregularities in its period—ranging from seventy-five to seventy-eight years—are due not to erroneous chronology but to the attractions of planets that draw near to it in its orbit.']

## THE TIMBER HAULING.

The leafless woodland stretches mile on mile
Against the sky;
And by each valley path and lowly stile
The blue mists lie.

Against the woodland felled oaks line the soil
Where once they grew;
And round about them men are grouped in toil—
Great horses too.

There is the clank of chains, the constant stroke
Of lopping axe;
The urging on, the straining at the yoke
Without relax.

And then the dragging, mighty length a-trail
Of each great tree,
Towards the mill which loud demands its tale
Of food to be.

The brave old oaks! Thus ravished from the ways
Which saw their pride;
Bestript of every bough which in old days
Outflung so wide.

So low they lie. But by each lonely bier
Young saplings rise;
And Spring is bringing in another year
With laughing skies.

# THE HEART OF THINGS.

By HENRY LEACH.

LONDON, *Yesterday.*

THE patriotism of the Briton is a quantity not to be calculated with precision. Certainly he is much more of the keen patriot than he generally appears to the people of other nations; if he had not been, Britain itself would hardly have stood where it does. But this man is not at all of an emotional type; and we have also to remember that, despite all that was said in the course of the elections at the beginning of the year, he is for the most part a prosperous man, has been so for a long time past, and this prosperity is not a thing that inflames patriotism. It is in the streets of the cities of the little, struggling nations that the men most frequently gather spontaneously, and constantly sing their national songs. Again, we must remind ourselves, for the credit of our Briton, that too many foolish demands are made upon him for demonstrations of his love of country. Day by day he is asked to exhibit his pride of race in respect to some cause which, though not unworthy, is yet not of such consequence as to justify the demand. A few men of Britain who either make their living out of some kind of sport or attach themselves to it because they would otherwise be idle, agree to play a match of some kind against a party of men belonging to another country, and forthwith the newspapers are full of details of all the circumstances and the progress of the great struggle, and this man of whom we have being speaking is exhorted to hope and hope again for victory for his country! Upon occasion he is asked to pay something towards the expenses of these men as incurred in achieving this great victory, and he does so. If he should fail to display the proper amount of interest in the proceedings, those who are wildly enthusiastic in this great cause suggest that he has not the proper feelings of a man who is a son of a great country, that he is not a patriot. No sooner is this great event decided than another is arranged in the name of Britain, and we have it all over again in its littleness and inconsequence, and the people who have sense and thought, and see something almost of desecration in all this, are nauseated. So they speak less of their patriotism. Only in two special circumstances does this reserved Briton, the man of real feeling and thought, generally display openly and with high fervour the love that he has for his country and the great glory that he has in her; and it may be that it is only when these circumstances arise that he himself knows what his feelings are in the matter. One of the situations is when he is abroad among the people of a foreign land, because it is only then that he does fully realise what a wonderful land and a worthy people he belongs to; and the other situation is when his country is threatened with danger by another. Then, indeed, the light of patriotism does burn brilliantly enough. But there is a body of excellent men, a society imbued with the best principles and desires, who do not think that this is enough; but, feeling that England is so great, they would like her sons at home to stir themselves from their phlegmatic mood at least once in a year, and do something, as it were, to celebrate her. We are led to these thoughts now, in the first place, because a certain danger which has been threatened, or has seemed to be threatened, to us by a Continental Power has awakened to a very considerable extent the feeling of patriotism in the minds of the multitude, and in the near future, as the awakening is continued and made more complete, the display will be the greater, and will be of such a strength, as it now nearly is, that it will be placed before party, as it should be. And the second reason is that a certain date in the calendar comes round again to us in this month of April.

* * *

If you stopped in the street the first hundred men of intelligent appearance whom you met, and asked them for what did the 23rd of April stand, it is highly probable that you would receive no reply that was in the least satisfactory or suggestive of patriotic quality from more than six;

[*All Rights Reserved.*]

and of these six it is likely, again, that four would be men of some literary knowledge, who would inform you that it was on that day that the greatest of our poets breathed his last, that Shakespeare died; while the better informed of the four would probably add that the day was most especially remarkable above all others because it was believed that Shakespeare not only died on that day of the year, but that he was born on it also, and that thus it seemed it might almost have been selected by divine Providence as a day that was to be regarded as of high national interest. These would be creditable remembrances, and we would not dispute with the man; but it is not at all certain that the poet was really born on the 23rd of April, though he certainly died on it. The fact is that we do not know exactly on what day he was born, but it was probably some time in late April, and he was baptised on the 26th. The 23rd as his birthday is a merely traditional selection, and the deathday may have induced it for the sake of striking coincidence. However, it matters little; we have one good reason, anyhow, for keeping the 23rd of April. These two other men of the six we spoke of may have another. Yes, perhaps 2 per cent. is a fair and just estimate of the number of people, English people, who will remember that it is St George's Day, the day of the patron saint of England, the one in all the three hundred and sixty-five that is specially marked as being the day for England. It may not be an estimate that is flattering to the people, but there it is. If you complain to these people of their ignorance and indifference, they may say sullenly that it does not very much matter, that they may think a great deal and do a great deal when it is necessary without bothering themselves overmuch about St George, concerning whom they really know nothing except what they are taught on the backs of sovereigns, where his historic conflict with the dragon is depicted. In the days of 'Merrie England' St George may be said to have done well enough; but afterwards his remembrance was much neglected until recent years, when a society with the greatest enthusiasm and the highest motives undertook the task of trying to stir up interest in his day in the name of English patriotism. In some, but not in a very considerable, measure they have succeeded. Some time since we were in conversation with one who is much concerned with this movement, and he urged that their efforts had so stimulated the fancy for the wearing of a rose on the 23rd, and the growers had so well fallen in with the idea, that whereas the national flower had only previously been worn or exhibited by accident, as it were, on the particular day, it had happened since that five trains were employed on the morning of it in bringing up to London the roses that had been grown in the Thames valley alone, and that train-loads came also from several other parts, despite all of which there was hardly one of the flowers to be bought anywhere at noon. This society, anyhow, does its celebration well, and encourages such celebrations elsewhere to the best of its ability and resources. It holds a festival dinner at one of the big hotels, where the dining-hall is a bower of roses red and white, and there is prominently displayed a bust of the great poet, with some of his most patriotic sentences written upon it. Every morsel of every dish is English, and no more English songs have ever been sung than those that are sung on this occasion. Then one of the very finest oxen to be found in the shires has yielded up to the banquet a great baron of beef, which is brought in with fine ceremony. First of all, the guests hear the sounds of drums in the distance, and the sounds come nearer and nearer until at last a herald attired in old English costume enters the hall and announces that the beef is ready. Garlanded with roses, and with the flag held in front, it is carried shoulder-high round the hall, the drummers accompanying it to the tune of the 'Roast Beef of Old England.'

* * *

All this is most excellent, and the patriotism of the guests is evident; but yet one cannot help thinking that a little something is wanting. The 'special occasion' does not seem to be sufficiently there. And now in the most recent times there has grown up a new movement for the selection of another great national day from the calendar, an Empire Day, for which the 24th of May, the late Queen Victoria's birthday, has been well chosen. This is not an opposition movement, but it would seem to those who think upon the circumstances that it must to some extent have the effect of one. Those who are propagating the idea of the Empire Day, foremost among whom is the Earl of Meath, who has strong and valuable ideas on the encouragement of the patriotic instincts and their display, which he explained to us on one occasion, have been doing so on a very thorough system. They have to a large extent captured the colonies; and as for the homeland, they are endeavouring to instil the idea into the minds of the children, who will grow up with it. They realise properly that an idea like this must be implanted in the very youthful mind if it is to do well, for you cannot so easily teach the old Englishman new ways of this kind. So we can hardly consider the future prospects of St George's Day to be very good; and the plain fact of the matter is, if it be not sin to say it, that this St George is not altogether satisfactory as a patron saint. These are materialistic times, when even in matters of this sort we are little sentimental but much inclined to strip the gilt off things and look beneath. So people may sometimes feel the question, if they do not ask it, 'Who was this St George, and what did he do for England?' It is unfortunate, then, that the supporters of the saint cannot put forward any good case on his behalf. He certainly had not anything like so much to do with the making of England as the King Harry with whose name he has been so often associated, who, according to Shakespeare, made kind refer-

ence to him, and whose bowmen at Agincourt shouted out his name as they shot their arrows. Yet very many books of reference will need to be consulted before anywhere you will find any explanatory mention of St George. The simple facts of his history are that he was born at Lydda about A.D. 270, of noble parents, it is said. He became a trusted captain in the Imperial Army of Rome under Diocletian and Galerius Dacianus, being martyred by the latter at Nicomedia in A.D. 303. According to this tradition, he thus attained to the earthly years of Christ; and it is added, moreover, that he died uttering a prayer for his murderers. It is a mere legend, although accepted by some who have made examination of the matter, that he visited England on a mission from Diocletian, and that upon this occasion he met Helena, the wife of Constantius Chlorus, he who subsequently became Emperor of the West. Helena, who, according to one legend, was of British birth, was the mother of Constantine the Great, who was proclaimed his father's successor at York just before his father's death there in A.D. 306. It is considered possible that in his earlier days this Constantine was a comrade in arms of St George; but, anyhow, after his conversion to Christianity Constantine dedicated no fewer than a hundred and six churches to him. It does, therefore, appear that it was he, the first Christian Emperor, who introduced the cult of his favourite saint into his native land. Constantine declared him to be 'Champion of Christendom.' This, at any rate, was the full extent of St George's association with England. Perhaps one should not be too critical of patron saints, or expect much past service of them; but then, as we said, these are materialistic times when every man, be he saint or sinner, is judged according to his worth.

* * *

It is being shown from day to day how very little do we know of the details of the schemes and proceedings of Germany in regard to this naval business which is causing so much anxiety. The people now realise that even if Germany's intentions are not directly hostile to this country, there is practically just the same danger as if they were in the rapid rate at which she is placing big battleships on the sea. Nor with Britain awakened is Germany now making the same ingenuous pleas as she did a little while since that in all that she is doing she is thinking nothing at all of Britain and her navy, but only of her own business and her own trade, and the need for self-protection against any possible enemy of hers. An eminent German professor, Dr von Schulze-Gaevernitz, lately put forward what was supposed to be the most moderate and peaceful German view of the situation, and he said that the German economists argued that sooner or later we must accept the inevitable, and admit that our naval supremacy in the nineteenth century is destined to give way to a naval balance of power divided among four or five nations. Then, he believed, there would be a greater chance of maintaining the peace of the world. Viewed in this light, the German fleet appeared to him to be the only healthy basis for an honourable understanding between the two nations, and he hoped that neither Germany nor Britain would trust its national existence to the goodwill of a strange Power, and declared that the peace that was vital to both must be secured by powerful armaments. The interest of both parties, he said, should point to peace, but it would have to be the peace of armed equals. The idea of neither of these nations 'trusting its national existence to the goodwill of a strange Power,' but the implication that England, which has never done so, should now trust hers to German goodwill, as would be done in any new understanding of this kind, is—interesting. However, in a little while we shall no doubt come to know much more of the precise nature of Germany's intentions and of the manner in which she is endeavouring to realise them than we do now. The present lack of knowledge of the British people concerning the men who are at the back of all this business in Germany, and what they are doing, is most amazing when considered in comparison with the knowledge that the Germans have of all our own naval affairs. The average Teuton whom you may meet casually in the street is in a position to tell you many noteworthy facts concerning our Admiralty and its system, having taken such an interest in it for a long time past, and he has a considerable familiarity with our Beresfords, Fishers, and the other men who have been most prominent in our naval affairs in recent years. But there is certainly not one Briton in a hundred who has the slightest idea about the German naval personnel. Our people have the elementary notion that it is all the Kaiser and his dreams of sea-power, and some of them have heard of Von Bülow. But they know nothing of the men of work and action, the men who are not figureheads engaged in scheming and talking, but who are making things and getting ready. How many have heard of a person of the name of Von Tirpitz? It is not improbable that even a large proportion of members of Parliament have not, so in their ignorance there is at all events some excuse for other people. Yet you cannot talk to any intelligent and well-informed German who is the least inclined to be communicative on the subject of his country's naval progress without having reference made to Admiral von Tirpitz unceasingly. For the fact is that this admiral, Secretary of State for the Imperial Navy, who is now sixty-one years of age, is the real creator of this German navy, and he is in all respects a most wonderful man, self-made, of indomitable energy and determination, and with one lifelong ambition to raise the German fleet to the level of any other or to make it superior to any. It is true that he, like the others, disclaims any idea of aggression, and there have certainly been times when he has stubbornly opposed what he regarded as extreme naval ambitions; but nevertheless he is the man

who has made and is making the fleet, the man who counts for as much as any, and it is interesting to consider him for a moment.

* * *

He was the son of a Prussian lawyer, and at sixteen years of age he became a cadet in what then went by the name of the Prussian navy, consisting of a few small boats which, had they belonged to Greece, might have been an ornament to her waters, but of little practical service to her. In nine years he rose to the position of lieutenant-commander, and it was at this early stage, when in a very minor and subordinate office in which traditionally he was to bow and scrape to all his superiors, and do as he was told without asking any questions or suggesting that he could think for himself, that he first showed his amazing talents, his wonderful initiative, his capacity for imposing his views on his seniors, and his astonishing contempt for the principle of seniority by age. He showed that he had original and strong views upon the future of the navy, and that he meant to do something towards carrying them out; and it happened that many of the best men in the service were attracted to him and gave him their support. By 1891 he was chief of staff at Kiel, the fleet's headquarters, and here he had real scope for the first time. The first thing he did was to set about the establishment of that torpedo service which has now for long been regarded as the chief feature of Germany's naval strength. When he went to Kiel the torpedo-boats there were not worth considering; but he soon made this section of the navy a magnificent force, finding men for his new boats, and training them in a special way, so that all were experts at their work. Then, after a violent campaign against the administrative system, he went out in 1896 to the Far East as rear-admiral commanding the cruiser division; and some eighteen months later he was appointed to the State Secretaryship of the Admiralty at Berlin, where many great changes had already taken place as the result of his attacks upon the old system. Despite the critics and the rivals who were surrounding him, he accomplished more; and then, when he had the house in order, he looked round and saw the great expanse of German commerce overseas, perceived the necessity for a big navy, and at once began to preach it. In 1899 there happened the famous *Bundesrat* incident, when a German mail-boat was seized by a British man-of-war, and enormous force was given to his arguments. In the following year the great Naval Law, his creation, was passed; two years afterwards the first ships that were sanctioned according to it were set afloat, and in 1907 his further persistent efforts resulted in the determination to build German Dreadnoughts. At each of these stages in his progress, an appreciative and grateful sovereign, who had not been entirely in sympathy with him in the early days when he made his bold attacks on the administrative system, gave him new honours, and to-day in Germany they call him 'Der Meister'—the master of the navy. This is the man who more than any other is the cause of our present anxiety, but about whom we have heard so little, so very little.

# LAURISTONS.

### CHAPTER XXVIII.—HOW LADY CHARLES HEARD THINGS IN THE DARK, AND WAS AFRAID.

AND now—as though Providence was not altogether unmindful of a brave man in extremity, even though he was a misguided one, and forbore to add to his burden—it seemed to Charles Lauriston that his wife's health was really on the mend. Very frail, indeed, she looked still, and as though any sudden breath of calamity might blow her quite away; but there was about her a new light of life, a rekindling of the waning fires, a recharging of the vital forces, which, for the time being at all events, made for life and strength.

There had, in fact, sprung up within her, not simply the desire to live, but a sudden fierce craving for life, a great soul-knitting determination that she would not die. Lauriston saw the effects in her apparently steady accession of strength, and rejoiced in it greatly. His deepest thought never came within measurable distance of the cause.

He set it down to the strong, clear air of Ealing and the skill of her doctors, and thereafter regarded all these with favour and never ceased to eulogise them. But, in simple truth, it all came out of his encounter with the young Irishman, and the wetting and the chill which followed. For a touch of fever slipped the brakes of his brain and tongue that night, and in his sleep he let drop words which fell on the pain-wakeful ears in the adjoining room like sharp blows. But a few disjointed words, simple words and terrible. At first she thought they came only out of his adventure with the highwayman. They pointed that way. And then John Sax's name came in. And, though she could make nothing of it all, she heard enough to chill her heart with sudden senseless fears of she knew not what, except that it was something terrible.

The best-loved voice in the world lacking the control of will-power and reason carries something of terror to the listening ear. For the voice is one of the outlets of the soul, and in such a case it is as though the soul of the loved one had departed and given up its body to a stranger, and the strange soul speaking through the known body startles and affrights. In the night-time too, even small terrors take unto themselves large shapes and magnify themselves manifold.

'What is it, Charles?' she had cried, in the sudden terror of hearing that strange voice in the dark. 'Are you ill, dear?' And the darkness lay so heavily silent that she heard her own heart beating.

She was beginning to believe that her ears had deceived her, and that it was only some wild dream of her own that had wakened her, when from the other room the strange voice came again in an urgent whisper that chilled her blood: 'A black road to travel! The gallows at every turning! A black road! Ay!' with a sigh like the last long-drawn breath of a dying man.

She lay shuddering at the uncanniness of the voice that was Charles's, and yet was not. Then she remembered the highwayman, and caught at comfort in the thought that he was reasoning again with that misguided youth.

'Utter ruin! utter ruin! One chance, you say, John Sax.' And at that her heart leaped into her throat and came near to choking her, and she lay trembling and in mighty fear. 'A burden too great for any man's bearing. He bore it. It killed him. If it was only myself! If they could go free! God help us, John Sax! Yes, yes, we will bear it together!' And then the dreadful darkness settled into silence, and he slept; but she lay thinking, and so presently, in natural course, to agonised praying for his deliverance from she knew not what.

In the morning she doubted herself, and still more when her husband came in to her with a face so calm and quiet that no stretch of imagination could associate it with her terrors of the night.

It was an evil dream of his or hers, she said to herself. The brain at times plays strange pranks while the body is sleeping. She would put it from her, and let it trouble her no more. Even to speak of it to Charles would be extremely distasteful and entirely useless. Nevertheless she found her eyes dwelling on his face with a new touch of loving anxiety in them, and he caught it, and set it down to her fears for his safety on the road.

And when their greeting ended with her quiet, 'I pray God to deliver you!' he set that down also to the nervousness incidental to her state of health and his encounter of the previous night, and she knew only that her heart was troubled for him.

But when he had galloped off to town, and the children had gone off to their schools, and she lay on her couch, face to face with herself and her thoughts, and none to come between, the conviction grew upon her, and gained force as it grew, that that which had come to her in the night was no evil dream, but simple grim reality. And as she lay brooding upon it, and accommodating to it her sense of the changes she had not failed to notice in her husband since his father's death, the further fear obtruded itself that here was something beyond her understanding, and not for her to know; something beyond and behind, a hidden burden which Charles was bearing with a quiet face for her sake and the children's.

She could not question him on the matter. If it was for her to know he would have told her. She would respect his desire, for what a man purposely withholds from those he loves is best not inquired into.

There had been no closed doors in their life hitherto. If Charles kept this one barred, it was for love of her and because he deemed it best.

But there was one thing to which she resolutely set her heart and mind. Her health had been a source of anxiety to him. It should be so no longer. Without ever losing the hope of recovery, indeed with a very earnest desire thereto for her husband's and the children's sakes—though, for herself, the social world offered little allurement—the not unattractive state of semi-invalidism had grown upon her almost unconsciously. Sleepless nights and spells of weakness had all too frequently disinclined her from any active participation in the doings about her.

But now her husband had need of her. He was bearing burdens. Anxiety for her had been one of them. It should be so no longer. There arose within her a fierce craving for life. If trouble loomed within the future, she would stand by her husband's side and strengthen him for the fight. And she would begin at once.

And when Charles Lauriston saw his wife at the week-end he rejoiced and blessed the pure air of Ealing and Dr Berkeley's prescriptions.

What it cost her at times to throw off the lassitude of weakness and to conceal her sharp attacks of pain none but herself knew. But her heart and her will were set steadily to the lightening of her husband's burden so far as it concerned herself, and in that, at all events, she succeeded.

*(To be continued.)*

## BLUECOAT SCHOOL MEMORIES.

PROGRESS takes toll of the traditions of our great public schools. Christ's Hospital had a place in every loyal Londoner's heart. The daily life of the City where that ancient foundation had played its part since the days of Edward VI. now knows the Bluecoat Boy no more. When he passed hence to Horsham a most picturesque page of educational history was completed. It was inevitable that in Sussex the school should lose its medieval atmosphere. Looking back across the years to the joys and embarrassments which varied the life of a taciturn Yorkshire boy for whom the foundation provided a shelter in its cloistered pile in the very heart of London, and close to St Paul's Cathedral, one cannot but think

of those early days with the liveliest gratitude. It was in some respects a life monastically austere. The stern discipline, the unwritten laws which precluded the shy new-comer from seeking outside his own 'ward' companions congenial to his tranquillity, the confinement after freedom where abounded sea-winds and the pure air of the wolds, exchanged for contact with loquacious and bantering Londoners—all these trials were there. The Bluecoat Boys who have the spacious buildings on the Sussex weald for their home cannot realise the quaint atmosphere of monkish formalism and repressive medievalisms in which their predecessors lived when the school stood in Newgate Street, London, a 'fine sight of charity.' Can it be said of the new Christ's Hospital, as was certainly true of the old Christ's Hospital, that it is without a parallel in the country?

The ward life in the old days, an old Blue may be forgiven for saying, was hardly imbued with comradeship or hearty good-feeling. The forty boys in each ward were under the dominion of a matron, a Grecian (or member of the top class), and two monitors, and the system resolved itself, in practice, into the placing of despotic power into one boy's hands, subject only to occasional petticoat interference. The masters were understood to possess no jurisdictional authority save in their classrooms, though no unfair advantage was ever taken of this fact. As far as the ward-life was concerned, the warden—the office is extinct—constituted the court of appeal. But if there were thorns and scourges to wound a new boy's pride, and the submission exacted was of needless humility, four years wrought a wondrous difference in his attitude towards the religious, royal, and ancient foundation. When old Blues, in the glory of modern dress, sauntered into the Hall Play, and good-naturedly demonstrated their prowess as footballers by performing an esoteric feat known as the 'first gutter kick,' we longed for the day when we too should be free; but the most graceless scamp among us recognised his indebtedness to the storied school of Charles Lamb, Coleridge, Leigh Hunt, Henry Sumner Maine, and other giants of learning in the days before ours. Coleridge, before completing his fifteenth year, had translated the Greek hymns of Synesius into English anacreontic verse as a self-imposed labour of love, and his intellectual sensibility was shared by many other Blues whose gifts we idly envied, and of whose application we were often reminded.

The striking dress of the Christ's Hospital boy—the broad-skirted blue coat adorned with a small epaulette, the russia drab breeches, and the stockings of brilliant yellow—is known in all cities, for every part of the kingdom has at one time or another been represented at the school, and the children are not permitted to wear any attire but that provided by the Hospital, except in the case of Grecians, during vacations. Once it was found that 'divers Children kept in the Cittie . . . doe not some tyme weare their blew coates and some tymes not weare their yellow peticoats as they ought to doe,' and the penalty set forth was that the child should be 'utterly dismist from the paymt. and clothing of this hospitall *ipso facto*.' Any addition to dress in the way of finery is also forbidden, because it 'will be of ill Consequence especially to those children who have no friends.' Whether the dress is a heritage from the Grey Friars, whose work of charity Christ's Hospital nobly carries on, or, as Leigh Hunt believed, the ordinary attire of children of the humbler classes in Tudor days, has not been definitely settled. The coat would seem to have been originally russet; but in 1553 all the children were in blue, and there has been no change since then in that respect. The absence of caps is a feature on which every Blue congratulates himself. Very small caps, which were chiefly used as drinking-cups at the Pump, prevailed until fifty or sixty years ago; but they were rarely worn. The long outer cloak, monastic of aspect, suffered many changes until 1758, when it was decided that the 'Boys Clothes shall be made agreeable to a Coat produced to this Committee, with Buttonholes overcast, and the Coats be always buttoned by the Taylor with White Metal Buttons with the Head of King Edward the Sixth, Founder of this Hospital.' A tradition is recorded by Leigh Hunt that in the beginning the button was of silver and the great-coat of finest velvet. Yellow petticoats were once part of the Blues' equipment, and breeches were lacking until 1736, when it was ordered that they might be provided for 'sick and weakly children as the Doctor or Surgeon or either of them shall at any time think necessary.' The Bluecoat girl's dress has never approached the boy's in distinctiveness.

Before entering Christ's Hospital I had, with the zeal of a youthful antiquary, read all within reach concerning those great occasions when the work of the Hospital was vividly brought home to a thronged and fashionable audience. There were the Lenten suppers, when due respect was shown, with quaint ceremonial, to the Treasurer. Bishop Compton's sonorous prayers were recited, and the boys advanced in twos to bow before their chief guest and the Treasurer. There was the Spital sermon, representing a custom which, even in Stow's days, dated to time out of mind; and preceding the sermon there was the Lord Mayor's hospitality at the Mansion House—all ceremonies full of the sentiment of a storied past, but not so gratifying to my instinct of the picturesque as the visions of splendour with which my ardent fancy—stimulated by much and varied reading concerning these memorials of antique pomp—had filled my mind. The procession to the Mansion House and the acceptance of shillings and wine or lemonade tested the independence of boys whose dreams were all of conquest in the great world into which they would shortly go. The Spital sermon which followed received the closest attention, even if the Lord Mayor's pew, as sometimes happened, held those

whom newspaper fame had made our heroes. The preacher being always a distinguished man, we certainly fared better than the genial Pepys, who wrote under date of 2nd April 1662: 'Mr Moore came to me, and he and I walked to the Spittle an houre or two before my Lord Mayor and the blewecoat boys come, which at last they did, and a fine sight of charity it is indeed. We got places and staid to hear a sermon; but it, being a Presbyterian one, was so long that after above an houre of it we went away.' Seven years later he went again, and found the sermon dull, but the ceremonious departure from the church struck him as 'mighty pleasing.'

The passing of the Lenten suppers is not to be regretted. They were of sham antiquity and little picturesqueness; further, they were certainly disliked by those compelled to take their humble meal under the eyes of inquisitive visitors.

In the olden days Christ's Hospital not only received poor children into its benevolent habitation, not only nurtured them physically, mentally, and morally, but also conceived it to be part of its duty to give them a start in life, sending the promising boys to the university, and seeing that the others were apprenticed. Thanks to the industry of the devoted Vicar of Christ Church, Newgate Street, the Reverend E. H. Pearce, historian and former assistant-master of Christ's Hospital, there may here be related an instructive story of how that great nursing-mother held out a helping hand again and again to one of her wayward sons. A boy named Lee, who had gone to Trinity College, Oxford, in 1692, and a brother Blue, were reported to be wearing apparel shamefully gay and fine for their station. Lee received from the committee a more appropriate suit of clothes, and it was hoped that his boyish peccadillo would prove an isolated indication of unduly high spirits. But horror was heaped on horror. Lee asked his tutor for leave to visit his sick mother, and was next heard of when 'in custody in Wood Streete Compter' for debt, 'not yet truely sensible of his past follyes.' After a time he promised to amend his past life, and the indulgent Governors decided to give him a fresh start, this time at Emmanuel College, Cambridge. 'And on Sunday,' so the Treasurer reported a day or two after he had taken the boy to Oxford, 'the said Lee pict up some of the young students about 3 o'clock in the afternoone, and went with them to an Alehouse; and when he came home to his lodgings, which was about ten at night, was very drunk, soe that the colledge nor himselfe did not think fit to continue him at the university, having committed such an egregious fault at his first entrance.' The Governors had no thought of sending their troublesome charge adrift, and at length decided '(it being the desire of the said Lee) that he shall be disposed off to the sea imployment, and be bound to Mr Stone a mate of a ship for 5 yeares.'

The story crystallises the spirit in which the affairs of the Bluecoat School have ever been administered.

# THE HAUNTED BUNGALOW.

By M. F. Hutchinson.

MAJOR CARTON'S kitmutgar waited with the patience of the East for his sahib's wife, waited on the veranda which ran round three sides of the colonel sahib's bungalow. The two ladies had been dining together. The man carried a small oil-lantern; he could hear the gay voice of his mistress as she bade her hostess a very prolonged good-night, but he was not supposed to understand English spoken in conversational fashion, only orders when they were very clearly and emphatically phrased. He had been told to be at Harding sahib's bungalow at half-past ten, bringing with him a lantern to guide hesitating feet across a dark compound a little distance along a road until his mem-sahib was at home again. He had accompanied her to the house, and stood behind her chair while she dined.

The rooms opened on to the veranda; in one, two English ladies talked; in another, an ayah moved noiselessly about setting everything in order for the night. In this room only a tiny lamp burned dimly, but the woman stepped here and there unhesitatingly. Close by the doorway, on the outside of which hung a purdah, she had deposited a bundle containing a thick mat and wadded quilt; since the master was away she would sleep across the threshold of her mem-sahib's room. The sound of voices reached her very clearly from the drawing-room; as she arranged the room that evening she sighed and shivered persistently. Perhaps it was because the nights were bitterly cold, and in her own quarters she would have crouched over the glow of a charcoal fire.

It was time to go, but at the very moment of departure Mrs Carton asked her hostess a question: 'Tell me, are you ever frightened in this place?' She cast nervous glances round the long, low room full of shadows. 'I ought not to have said that,' the visitor added impulsively; 'it's only because I am such a coward, you know.'

Mrs Harding laughed. 'Your ayah has been telling you tales.'

Mrs Carton gave a little gasp of relief. 'There, you know the story after all, and think nothing of it. A thousand times I've longed to ask if you ever heard queer sounds or saw anything here. Charlie declared you had not a notion this was called "The Haunted Bungalow;" he said your husband had told him so.'

'Of course I know the story. Far be it from me to teach you to think anything except that Major Carton is the wisest man in India, after my husband. As it happens, I do know the story, every word of it. What is more, I sleep in the very room she crept out from on her hopeless errand, poor dear.'

'Tell me the real story,' urged Mrs Carton. 'Charlie declares he does not know it. He tells fibs shamelessly.'

'Is it good for the nerves to be told a ghost-story at night? There 's no real ghost about it, though—not that I should be afraid of any one as splendidly brave as she was; but I have never seen a thing or heard uncanny noises except those made by rats and other crawling beastesses. When you hear the true story you will never be afraid of this bungalow again. Come, I believe I understand why you refused my urgent invitation to stay here while we are alone. Years ago, just before the outbreak of the Mutiny, Mrs Martyn, the wife of the colonel of a regiment stationed here, was alone with the servants; the regiment had been out in cholera-camp, but was to march in next day with a clean bill of health. Her ayah slept in her room. She woke in the night, to hear voices whispering, sat up noiselessly in the dark to catch every word, heard enough to know that an awful scheme was on foot, then lay down again, no doubt wondering if she could have dreamed the horror. Those out in camp, quite unprepared for any evil, were to be set on by Sepoys on that road we now call the Drive. You know the great heap of rocks that seems so out of place, and which all new-comers think so picturesque? Well, it was there the massacre took place. The ayah who afterwards told the story declared her mistress heard her bargaining with these devils to spare her life. Mrs Martyn must have felt blank and utter despair. What could she do?

'One can only imagine everything that passed through her mind; but it is a fact that while it was still dark she crept out of bed and wrapped herself in the ayah's chuddah, which the woman sleeping on her mat had left folded at her feet. Thus disguised, the Englishwoman stole out into the compound, hoping to get out to warn those marching in. Ah, one can picture it all! In these days our soldiers live in a state of preparedness, but not then—not then! In the compound she was set upon and stabbed to death; they thought, you see, that it was the ayah who had betrayed them. Will you tell me if any one could be afraid of the spirit of such a brave woman? She was going to do what she could, and at the risk of her own life. It is only the natives who are afraid of the bungalow, and declare, among themselves, that it is haunted. But if you asked my ayah, good, faithful soul, at this moment, she would declare there was no truth in the story as I tell it; yet *the* ayah was her own grandmother. She would assure you the colonel's mem-sahib died of cholera. An advance-party of the regiment coming in to make ready for the others was literally cut to pieces, and two English officers died with them. That's the story. Is it one to make us afraid, and for husbands—well-meaning husbands—to conceal?'

'That poor woman!' exclaimed Mrs Carton. 'Well, I am glad I don't live here. If I did I should think of her too much. I wish husbands were truthful people. Ours have assured us their absence is caused only by a fear that the cantonment water-supply is not of the best, that it was necessary to inspect the source and to meet that engineer man, whose name I can't remember. I am certain water has nothing to do with their absence. They are desperately afraid those men in Keranchi jail who were caught here will be let off too easily, and they have simply gone armed with all kinds of dreadful facts proving sedition and everything else, added to bomb-making, because it was not wise to write them. There! And they talk to us about the cantonment water-supply! They were always interviewing natives after dark in the adjutant's office. My ayah says the bazaars are full of talk—bad talk, and—— I think I'll go,' she added quaintly, 'while I have anything approaching a nerve left with which to cross the compound.'

'Don't indulge in bad dreams, my dear,' urged Mrs Harding. 'Remember how strong Englishmen in India are to-day; just think of that and be proud. Besides, remember also how we vowed to obey. If it pleases our lordly husbands to deceive, should we object?' She laughed gaily; people always said Mrs Harding was the cheeriest woman in the station. 'Shall we send for your night-things, and will you stay here? Don't imagine you'll be lucky enough to see a ghost, because you won't.'

'No, no; let me go,' said Mrs Carton hastily. 'Charlie will be back to-morrow, and doubtless I shall be telling him everything—all my cowardice and silly fears. Somehow, I always do; and he vows to tell me everything, and never does. I'm certain, too, he thinks all the time how splendidly wise he is, and it's fearfully annoying.' Then she laughed and declared she would get her cloak.

Mrs Harding clapped her hands. Instantly and noiselessly, without even the click of bangles or anklets, her own ayah appeared with the cloak and hood. The guest shuddered and grimaced. 'If only they would make a little noise when one's nerves are all on edge!'

She looked a pretty, dainty little creature, one to be taken care of, lifted over rough places. Was it wise to let her go? Doubtfully the hostess went with her to the veranda, where there waited the submissive figure of the kitmutgar. The lantern burned dimly; he had waited long. Mrs Carton would not hear of another being brought; it would serve splendidly for the little distance she had to go.

'Then I shall wait,' declared Mrs Harding, 'until I hear you call "Good-night."'

'It shall be "All's well!"' answered the other gaily—'"all's well!"' So, cheerily she stepped into the

dark compound. Mrs Harding wished she had insisted on keeping her friend. It was not many minutes before two words reached her, not 'All's well!' but 'Good-night.' Echo seemed to catch and prolong the sounds so familiar to India from English voices—used, too, even by the natives themselves. What a forgetful little person Mrs Carton was not to have remembered the words were to be 'All's well!' Perhaps, when reaching the bungalow, from which the master so dearly loved was absent, she had felt she could not say them. Still, to-morrow everything would be well indeed.

Mrs Harding knew the danger of allowing thoughts their way at night, so she went briskly into her own room. There the ayah brushed her beautiful hair, the only attraction she possessed, as she often told herself; the dark, lithe fingers seemed to linger on it caressingly. Were there, in any other country of the world, such devoted servants as those of India? This woman simply insisted on sleeping like a faithful dog near her mistress. Well, the sooner to sleep the quicker would come the happy hour of the return.

. . . . . .

What was it—a dream—that long and steady pressure on her hand? Eleanor Harding woke; it was still dark, so the coming of the ayah with her chota hazri had not roused her. Besides, Chua would never touch her hand like that. There were voices; she heard them distinctly. Again came the pressure on her hand. Why, it was a dream; she was going through the story she had told to Mrs Carton! Voices!—whispering voices! Suddenly realisation came to her; she was not asleep but wide awake, listening to the tones of her own ayah speaking with some one, if not in the room, on the threshold. The voices were very low, and yet she knew what they were saying:

'The sahib of her who sleeps here will return in the morning. We know the hour; we know all; nothing is hid from us, for we have eyes and ears everywhere. Yes, they ride back, the proud sahibs, and the three with them! Now, who shall throw blame or say evil words if one of the three falls, and comrades hasten from their saddles to help? The other two ride on. Never again will they send men of our kin to jail for writing and speaking true words to those of their own race. Now, why weep? It shall be a worthy lot to comfort the mem-sahib who will listen in vain for the strong step of him she calls Beloved. If not this hour, surely it will be the next! Then he will be carried home, the other sahib also, to his place. Loud can be raised the voices in mourning! Peace! All will be as I have said. Shall papers be sent, with words upon them not good for our race, by Harding sahib, to make woe and distress? These papers are here in my hand. They buy in their own country boxes with locks that they think good. Peace! When they search for his papers, lo, there will be none! The evil and the trouble will die with him. Peace now. I go!'

The Englishwoman lay stiff and straight on her pillows. Oh, the bitter horror of it all, the horror of helplessness! There was a movement in the room, a glimmer of light. The ayah Chua crept across to the bed, came to see if her mistress slept. With a supreme effort the Englishwoman forced her lips into the smile of one who dreams happily. The cautious feet stole away again. Eleanor Harding opened her eyes and peered round the familiar room, the very room in which another woman years before had been roused to hear the details of evil plans whispered. With a touch of comfort she remembered that long, lingering pressure on her hand: were the forces of the invisible world to be ranged on her side in an effort to save? She had felt that tender touch, not imagined or dreamed it. How came it that she had heard distinctly those whispered words? She must fight against the cloud of horror threatening to engulf her senses, to make clear thought impossible. If she gave way to terror nothing could be done. She must lie very, very still and work out a plan. Two Englishmen in the year 1909 riding home to a peaceful station, men who had unhesitatingly and ceaselessly advocated the strong, firm hand in India, would be murdered on a quiet road a little more than a couple of miles away! She seemed to see clearly before her the pile of rocks, the nullah on the farther side. There the murderers would hide, and shoot with deadly precision. Shoot! A quiver of pain racked her limbs. Shoot! They would throw their horrible bombs! Ah, the agony of lying still! Could she have ever dreamed that her comfortable charpoy would become a place of torture? She must not think of herself. She went over the story she had told to Isabel Carton.

Mrs Martyn, roused by voices, had waited a short time until she felt sure her ayah slept, had then risen, tried to disguise herself, crept out on to the veranda to take a few steps through the compound, only to be struck down by cruel knives, the knives of those who thought it was the ayah on her way to betray them. These men had promised to spare the life of the Englishwoman. She had done what she could, and failed. There was a lesson to learn from the pathetic story, the hard lesson of lying perfectly still through the dark hours of loneliness. In some way or other she must reach those rocks on the Drive, the upper road, before the men riding home from Keranchi, tell them of the horrible ambush, and persuade them to make a wide detour by the lower, rougher road. Yes, this must be done. But she knew her husband; she knew Major Carton. What would they say and do? Would they consent to ride round another way? Would they not insist on riding up to those rocks and—— Her presence might force them to turn their backs on danger. She could even see the expression on her husband's face as he listened to her story and agreed to do what she urged. It would be agony to him; his would-be murderers would instantly guess she had brought a warning, and how they would

triumph in secret over the two who rode away! Another thought came to her. Over and over again the recent murders in India had been declared to be the work of one man, the planning of one brain; men on trial had owned as much. Hitherto it had been impossible even to guess at the identity of the arch-fiend; but Colonel Harding had one night confided to his wife, when she reproached him for working so persistently over masses of papers, that he believed that fortunate circumstance had put him on the track of the right man.

She shivered again. Those words spoken to her in English, talked over in the adjutant's office, guarded by a sentry, had they been overheard?

Was there the smallest danger in ordering her horse very early in the morning and bidding the syce accompany her on the upper road, the Drive? Often she had ridden thither, and had as often passed the silent, dreary pile of rocks. Was there danger? She knew the voice of her own ayah, but not that of the other whisperer in the dark. Was it one of their own servants? At least it was some one known to the dogs, because there had not been one disturbing bark. If the syce were also in the league against his master? Smouldering fires might burst into flame through the apparently simple order. What if she were forcibly prevented from taking her morning ride? If not that, could she keep calm and cool if she were told it would be impossible for Huzoor, the horse she loved so dearly, to carry his mistress that morning, since he was 'sick, very sick indeed'? What should she do, how plan wisely enough there in the dark, with horror and terror for company? Then again she remembered that pressure on her hand; she had been helped then: might she not be helped again? Had God in His mercy sent her a messenger who had passed through the torture she was experiencing? What if death lay at the end of the road she must tread? Let her see her husband once more face to face, just once more, and though she was young and strong, with no wish to die, she would be quiet and submissive. The thought of him and his agony for her brought scalding tears to her eyes; she remembered promises made by English husbands to devoted wives of swift death by a merciful revolver held by the hands they loved best rather than that they should fall into the hands of deadly foes.

What should she do—what could she do?

At length plans took shape. She would rise early, a little earlier than usual, and would not order her horse at all, but walk across to Mrs Carton's bungalow, and—— No, no, not tell her—most certainly not; but Mrs Carton had two riding-horses; she would borrow one and suggest that they ride together, pretending to turn their faces from Kerachi. And then—and then—— Well, with another woman she might do it, but not with Mrs Carton. The only thing would be to persuade the little lady not to ride that morning, but to save herself for her husband's coming, and promise to exercise her favourite for her, pretend gaily to try his paces. Would this idea serve? Ah, how foolish she was, how badly she planned! She would go to the adjutant, tell him her story, and beg him, instead of going to the firing-range, to order an early route-march along the Upper Drive Road. Let them take possession of the rocks as a point of observation. Mrs Harding was not a soldier's wife for nothing. But what if they talked soothingly to her of nightmare and other evils which pass away with the night? What if Major English (acting second in command) and Captain Addison, the adjutant, refused to listen? What then — what then? If one of them offered to go himself, even with an escort, to prove there was nothing to fear, other lives might be sacrificed—sacrificed in vain. Perplexity and horror! horror and perplexity! Ah that she might dare to strike a match, rise from her bed, move about, pretend to search for a book, do something instead of lying there waiting for the dawn that seemed so long in coming!

One course made itself perfectly clear: she must do nothing unusual, but meet the day just as she had met other days, act as if those whispering voices in the dark had never disturbed her rest. Ah! it was not those sounds that roused her, but the persistent and repeated pressure on her hand. Each moment, dragging by, made her feel how hopelessly inadequate was any plan she made. She must just trust that as she had been called back from sleep, so she would be helped, when the moment for action came, to do the wisest thing, not only for the safety of her dear husband but for India too.

At length, with the suddenness of the East, the day broke. Mrs Harding heard her ayah move and stir. Ah, thank God! something she touched rattled and fell noisily to the floor. It gave her the excuse for stirring she needed; so she moved sleepily, and then called in a voice of reproach, 'Chua, what tamasha is this? Day is not here yet.'

'It is early yet, mem-sahib,' came the submissive voice. 'Rest again.'

'Rest again! That I cannot, for you have roused me. My chota hazri, quick! But I do not need Huzoor; tell the syce that. Truly, it is vexing that you have waked me so early.'

Ah! there was comfort in watching the woman go out of the room, pressing fingers to aching eyes, even to push aside the mosquito-curtains and feel for slippers placed on a table out of reach of enterprising rats and ants. In her dressing-case was a box of rouge, used carefully when the hot weather made her look haggard and yellow; a touch of it now, and there would be no ghastly pallor for the ayah to notice when she brought tea and toast. Mrs Harding slipped back to her charpoy, the place of her long torture. It seemed interminable ages before the tea and toast appeared. It was strange to hear all the familiar sounds, the water poured into the tub in her bathroom, everything as usual. Still exercising supreme courage, she forced herself to dress carefully and slowly, even when Chua pre-

pared to do her hair to be patient and particular. And yet she could have screamed at each touch of the brown fingers.

At length, in her sun-hat, with its white pugaree, she passed out on to the veranda, and called the dogs, her own dear dogs, who came scuttering gaily to meet her. It was very difficult to keep the tears from her eyes. Once out of the compound, Mrs Harding had the greatest difficulty in keeping her rigid self-control; she wanted to run quickly to get within reach of the sound of comforting voices, the touch of strong and confident hands. The bungalows, each in its own compound, with smoke rising from the various fires in the servants' huts, looked so familiar, so secure; would it be difficult to obtain belief for her story? That difficulty, she felt, it would be impossible to bear; she had forced herself to keep calm and quiet through the dreary night, but if she had now to fight against incredulity she knew it would break her down completely, make her feeble, powerless, hysterical. Ah, she must keep her wits about her! Would it be better to trust to herself, borrow one of Mrs Carton's horses, appear gay and unconcerned, and make her way alone by the lower road until she reached the little party riding in from Keranchi?

Distracted with conflicting thoughts, she closed her eyes, heedless of the dear dogs leaping round her, thought of the invisible hosts, 'the hosts of the Lord,' and prayed for help. She was out on the road, wondering which way to turn, what to do, but walking steadily forward, her big white umbrella used as a stick; she felt as if she needed all its help. She lifted her eyes, to see horsemen cantering gaily towards her; the dogs, in a joyous rush, had left her side. Could it be her husband on his big black charger, with Major Carton on his horse with the white star on the forehead—the horse they called Luck? Behind cantered the four who made up the escort. The earth swayed; everything about her was falling, falling, just when the man she loved was so near. She must fight for courage, not foolishly behave there in such a fashion as to excite the attention of dangerous, watching eyes when there was so much need for caution.

Courage came with a rush when a strong voice called to her, 'Eleanor, how often have I told you not to get up so early? If you could see your face!'

She pressed her fingers firmly to trembling lips. Major Carton saluted, said something—she could never remember his words or her reply—and turned in at his own gates.

Colonel Harding sprang from his horse, kept the reins in one hand, and slipped the other into his wife's arm. 'Eleanor, you look like a ghost, and you have been haunting me; that is why I am here so early. Regular nightmare! I dropped asleep after dinner, and saw you lying in bed, stiff and straight, with wide-open eyes, listening to voices in your room. I saw other figures, but not distinctly. It made me deuced uncomfortable, but I put it down to indigestion. We turned in early, for that brute of a dream came back as soon as I fell asleep. I woke up, then dreamed it again. I couldn't stand it any longer, roused Carton, and told him I must get back here. He suggested, good chap as he is, that we should start then and there, so here we are! Tell me I'm a fool!'

She did nothing of the kind. 'Dear'—she struggled pitifully to speak steadily—'it's all true, every word. Take me somewhere, not to our bungalow, where I can tell you everything. I can't talk there.'

Colonel Harding's grip on her arm tightened. 'We'll go to the adjutant's office. Sweetheart, no wonder you look a ghost!'

In a plain little room, with the serviceable table and chairs, he heard the story of a woman's pluck. He listened silently, but the look in his eyes was enough for the woman's heart. Then he made plans swiftly and well that strengthened the nets he was spreading. In less than an hour's time he stood in his dressing-room unlocking the great despatch-box in which, on account of its two excellent locks, he considered papers safe. Had Eleanor dreamed as well as he? For there lay the papers just as he had left them.

But when Mrs Harding called her ayah there came no voice in answer. At length a young woman came running and salaamed at the lady's feet: 'A strange and swift illness had seized upon Chua, who had served long and well, and, lo! in a little moment she was dead.'

## THE MONTH: SCIENCE AND ARTS.

### ELECTROPLATING AT HOME.

CONSIDERABLE interest has been aroused in the discovery by Mr Augustus Rosenberg, a rising scientist, of a new method of cleaning and polishing metals. It is diametrically different from the majority of metallic cleaning-mediums, since—whereas the latter are essentially abrasives and corrosives—the new substance, to which the generic name 'galvanit' has been applied, is a deposit. In reality, when cleaning with this substance the person completes a metal-plating operation. For instance, articles of domestic utility, the silver-plating of which has deteriorated and worn off, can be restored to their pristine condition within a few seconds with no further apparatus than a small piece of rag upon which has been placed a little of the wet galvanit silver powder. All that one has to do is to rub the article vigorously with this, and in so doing an electro-chemical action

is produced which deposits a layer of real silver upon the surface of the article. It is the same with other metals, which can be similarly treated with cadmium, tin, nickel, and so on. It will be seen that the cumbersome electroplating bath and its intricate process can be extensively dispensed with. The galvanit substances are prepared in powders, each grain of which may be likened to a complete electroplating battery. The powders are perfectly harmless, being impregnated with no injurious or poisonous substances whatever. The powder metallic particles associate with the metal of which the article which is being cleaned is composed, and as a result it becomes tinned, nickelled, or silvered as the case may be. Moreover, the deposit assumes a brilliant lustre quite equal to that produced by burnishing in the ordinary electroplating process. All that it is necessary to do is first to clean the article thoroughly by washing, and remove all rust and other foreign deposited matter by scraping. It must then be well dried and polished. The greater the polish before galvaniting, the more brilliant will be the resultant effect. When sufficient deposit has been made, a point easily determinable from the appearance, the article is simply well rinsed in hot water to arrest the chemical action, and polished with dry leather in the usual manner. The plating is permanent, and there is the further advantage that each successive cleansing of the article with this substance increases the thickness of the deposit. A striking demonstration of the marvellous possibilities of this new invention was recently given before the members of the Society of Arts, to whom the process was described. Professor Sir J. J. Thomson, who was in the chair, produced one of the famous magic Japanese mirrors. The process by which these objects are coated on the back is a mystery to Western civilisation, and it has hitherto been difficult, if not impossible, to clean them so as to produce the original lustre. The mirror produced by Sir J. J. Thomson was greatly tarnished, yet in the course of the discussion the inventor resilvered half the mirror-back by his process, and when it was submitted to the action of the electric arc light the characters on the back of the mirror were plainly reflected. Sir J. J. Thomson explained that scientifically the restoration was complete. In face of this exacting test there is no doubt but that galvaniting will have an extensive vogue; though it must be explained that it will never entirely supersede the ordinary electroplating system, but will spring into popularity in the household for cleaning articles of frequent use, which can ill be spared for renovation by the ordinary means.

### A NEW FLOOR-COVERING MATERIAL.

The ideal floor-covering material is without a doubt mosaic wood, or, as it is more generally termed, parquet. It presents a smooth, level, homogeneous surface, which is easily cleaned, and which in its polished condition presents a strikingly handsome appearance, with the figuring of the blocks running in varying directions. Unfortunately, however, it has the disadvantage of being expensive, and when laid cannot be removed. A recent ingenious invention has, however, brought the parquet floor within the reach of all, especially of those resident in flats and houses upon short tenancies, for it can be removed when one leaves the premises and relaid in the new home. The cost is slightly higher than that of the first quality linoleum, but it has the compensating advantage of being everlasting in wear. It is composed of thin pieces of figured oak or American walnut about an eighth of an inch in thickness, attached to a cloth back. The pattern is built up of small squares, rectangles, or diagonals as desired, laid transversely and alternately to one another, so that warping, splitting, or bulging is absolutely impossible, and when laid it rests quite flat upon the surface of the floor. The provision of the cloth back not only constitutes a foundation for the parquetry, but also acts as an insulator. The surface is planed and waxed, and all that the purchaser has to do upon receiving the material is to lay it, which if he is a handy man is an easy matter. If desired, the parquet can be temporarily attached to the floor by rustless pins, or permanently attached by means of glue. To remove it, the pins are extracted, and the parquetry withdrawn in flat sections. The material has been subjected to prolonged private trials, the success of which has been so convincing as to warrant its introduction to the public. Certainly it constitutes an ideal hygienic, damp-proof, draught-proof, silent floor-covering, and offers no refuge for dust and dirt. As a surround to carpets it is preferable to felt or linoleum, and in appearance is much more artistic. The material is prepared in a variety of designs, and certainly constitutes the nearest approach to the much-admired parquet wood block flooring that has yet been evolved. In fact, when laid it cannot be distinguished therefrom. The oak being well seasoned and waxed, it is absolutely non-absorbent; and no matter how many times it may be removed and relaid, it will retain its original appearance.

### THE CULT OF THE SWEET-PEA.

During the past few years the sweet-pea has enjoyed increasing popularity, and there are few gardens to-day in which this exquisite blossom is not seen. This development is in a great measure due to the efforts of Mr Henry Eckford, who has accomplished for this flower what Luther Burbank has achieved for fruit. A decade ago the sweet-pea was a common-looking bloom possessing no special attractions either in regard to colour or shape. To-day it cannot be rivalled in beauty nor excelled in the brilliancy and variety of its colourings and forms. Mr Eckford's lifelong experiments in this field constitute a fascinating romance in the

story of horticulture; but it must be admitted that the successes, at least to-day, are few and far between. It is becoming increasingly difficult to ring the changes on nature and to secure fixity of type once a new development is achieved. Still, each year produces what may be termed its triumphs, and those for the forthcoming season, four in all, are among the finest that have yet been obtained. The waved representatives are particularly beautiful, and those who make a point of devoting especial attention to this cult and of keeping abreast with the times will appreciate many points of charm in 'Picotee.' It is a giant flower of dazzling, pure white, with a delicate edge of carmine. The stems are long and strong, and each invariably carries four blossoms, well placed, and of splendid substance. 'Mary Vipan' is another recruit to this class, being beautifully waved and of fine substance and size. The petals at the base are almost white, giving way gradually to a deep-bright rose at the outer edges, imparting to the blossom an effective brightness. The other novelties are 'Vicomte de Janzé,' a bold, well-shaped flower of deep-bright rose-colour, and 'Mrs E. Gilman,' which has a creamy ground suffused with bright-rose and almost pure cream wings. In consonance with the production of new varieties of this flower, the methods of culture are being carried out upon more rational lines. Instead of growing them thickly in long, unsightly rows, true garden-lovers are devising ingenious ways and means of securing the utmost blossom-effect. The latest method of growing ensures this being fully obtained. The peas are sown wide apart in isolated clumps. The supports comprise upright stakes set at the four points of the compass, outside the bed, and joined together at the top by cross-pieces so as to form a cross. Large-meshed galvanised sheep-wire is then placed round the stakes, forming a skeleton column. The peas throw out their tendrils and creep up through the meshes of the wire. In the height of the season a most striking effect is obtained, the wire being covered with a solid mass of blooms. In this manner each plant has ample room in which to thrive, and receives its maximum demands in regard to air and sun, while the roots likewise are not crowded and stunted.

### A NEW COPYING-PAPER.

Nothing has been so pronounced in modern business methods as the adoption of time and labour saving appliances. This is especially the case in regard to correspondence and clerical work. The old-time press, copying-book, and the messy brush and water have been completely driven out. This has been due in a great measure to the liberal utilisation of carbon copying for all transactions in which a fac-simile copy has been required. Even in this direction great improvement has been effected of late. The carbon paper, though effective, is greasy, dirty, and imperfect in its results. Now there has been produced a medium which is as clean as the writing-sheet itself to handle. There is not a trace of carbon in the paper, yet the copies are much cleaner and more distinct than those hitherto obtainable. Moreover, the paper is applicable to the typewriter, pen, stylus, or pencil with equal facility, so that the range of utility is appreciably extended; and in writing with a pen it is possible to secure as many as ten perfect copies simultaneously, the tenth copy being as clear as the uppermost sheet written in ink. This system has been perfected to a remarkable degree, and it has been devised to meet the requirements of commerce and private transactions. One great objection hitherto has been the difficulty of the private correspondent in securing a fac-simile copy of a letter concerning, say, an important transaction, and in many instances this omission has led to dispute. This is all altered now. A handy device has been perfected whereby the writer can use his own note-paper, and yet in writing his letter secure a copy thereof in a book, or if desired upon a separate sheet of paper for filing. Such facilities as these are of distinct advantage to the man with a small business. The volume when full can be unobtrusively stored on the book-shelf. In using this device the perforated edge, too, which to some has many drawbacks, is obviated, and correspondence can be conducted with ink. Copying with a pen in the same manner as is possible with the typewriter is something new, especially in connection with single sheets of detached notepaper; it is more economical and efficient, and its applications are limitless. Then, again, the fac-simile is permanent and cannot be defaced. The copying-paper can be handled with impunity, but will not soil the fingers, and it is stronger, cheaper, and more durable than the ordinary carbon paper. To mention here all that may be done with this new copying-paper is impossible; but we have described it sufficiently to demonstrate its utility.

### OPEN-AIR RECOVERY SCHOOLS.

An interesting experiment has been carried out by the Sheffield Education Committee in order to raise the standard of efficiency in the ordinary schools. In our large cities the backward child is a most perplexing problem. A certain proportion, though physically fit, are mentally dull, and for this reason their treatment is difficult. The remainder are only backward because, the struggle for existence being so keen, the body is rendered physically incapable of withstanding the strain of the ordinary curriculum. It has long been argued that if their depressed vitality could be restored, and the many ills attributable to malnutrition naturally cured or avoided, then intellectually they would be on the same plane as their more fortunate fellows. To test this theory in a practical manner, the Sheffield authorities last year decided to establish an open-air school for fifty debilitated children. A disused school and playground pleasantly situated mid rural surroundings was selected, and here the children received their

daily instruction in the open air. Two nurses were appointed, their duties being to assist the officials in the weighing of the children at periodic intervals, to examine as to cleanliness, to visit the homes of the children, and to impress upon the parents the necessity for sending their children to bed early, so that they might receive a sufficient amount of rest and sleep every night, and the importance of fresh air and plenty of it. Only children between the years of nine and thirteen were selected, and the class comprised some suffering from malnutrition due to poverty, anæmia, oral sepsis, debility after operation for tonsils and adenoids, and others developing symptoms of pulmonary tuberculosis. The children met at a certain point at a quarter to nine in the morning, and were conveyed in vehicles to the school. Here intellectual work was reduced to the minimum, a period of three and three-quarters hours daily. The rest of the day was given over to practical instruction in gardening, housekeeping, nature study, and personal hygiene, under the supervision of two teachers. Personal cleanliness was emphasised, and the children soon devoted attention to their hands, teeth, hair, and so forth. Two warm shower-baths were taken weekly. Three good meals were given daily—breakfast immediately upon arrival (consisting of porridge and milk), dinner at one o'clock (followed by two hours of rest in the open air on deck-chairs and covered by a blanket), and tea at five. The parents contributed to the cost of the meals according to the limits of their purse, this expenditure ranging from sixpence to half-a-crown weekly. The school was open for five days in the week, and the children were sent home at a quarter to six in the evening. The experiment was placed in the hands of Dr Ralph Williams, the school medical officer, and it was found that the average weight of the children after six months improved 10 per cent., and at the end of the period was about 5 per cent. greater than the average increase at the ordinary schools in the same period. Moreover, the pupils were brighter, smarter, and tidier, and all signs of depression and mental backwardness had disappeared. The success of the experiment should be a sufficient inducement to the educational authorities of other towns and cities to follow on the same lines. This is a question which the Germans have taken firmly in hand, for it is one that vitally affects the welfare of the country, and the establishing of these schools will materially help in arresting the physical deterioration of which so much is now heard.

### SOLDERING AND GALVANISING ALUMINIUM.

Although innumerable efforts have been made to devise a simple commercial process of soldering aluminium, but slight success has been attained. It is for this reason that great interest is attached to the latest development in this direction, which is exceedingly simple and highly efficient. The examples of such work have compelled attention, and the joint is so strong that it may be subjected to bending without showing any signs of deformation. The same inventors also discovered a means whereby aluminium can be galvanised and plated. The great difficulty which has frustrated work in this field is the superficial oxide coating which the chemical assumes, generated by the oxygen in the air, and which, as in the soldering process, prevents the deposit in the galvanising operation from securing a hold upon the aluminium itself. This action has now been overcome, and thin colouring coatings or thick protective coatings may be applied to the aluminium as easily as to silver and other metallic articles. The process is also stated to be equally applicable to any aluminium alloys.

### DRAUGHT-EXCLUDER FOR DOORS.

Who has not experienced the discomfort arising from a draught of air whistling beneath the door, and resorted to endless artifices to combat the nuisance? The latest idea in this direction has many points of recommendation, for it appears to solve the problem very neatly. Over the mould at the bottom of the door is placed a hinged device of brass. This is made the full width of the door, and the upper plate is fixed to its surface just above the mould. The mould itself is covered with a plate hinged to the section secured to the door. This second part is also hinged in the middle. At the outer edge is hinged another flange, which hangs vertically over the mould, and this is in contact with a triangular sheet of brass bent over the step of the door. When the door is closed this lower swinging section rests upon the inner inclined part of the step, so that there is no gap. When the door is opened the swinging plate slides up the triangular foot-plate to the apex, and then down the opposite side; and when it closes the reverse action takes place. A draught cannot possibly force its way under the door, and similarly neither rain nor dust can force an entry. The device is certainly efficient, capable of being fitted to any door in a few minutes, and free from any liability to derangement. It can also be attached to windows with equal success, and will in this case give an absolutely watertight fitting.

### MOTOR FISHING-BOATS.

In order to encourage the development of the motor fishing-boat, an exhibition of marine oil-engines specially suitable to the rough-and-tumble of the fishing industry is to be held at Great Yarmouth in the first fortnight of November next. The time and place have been selected as being the most convenient to bring the possibilities of motor-driven fishing-vessels before the owners of the Scottish sailing-boats. The latter have been seriously affected by the steam-drifter, and these in turn have increased in such numbers that competition has been brought to a keen point, leaving a very small margin of profit, and a reversion is being made to the wind-propelled craft. It has been proved, however, that when the sailing-boats are

fitted with auxiliary motive-power in the form of an oil-engine their efficiency is vastly improved, as the working of many such craft around the north of Scotland and the Orkneys abundantly testifies. The difference in first cost of an oil-driven boat and a steam-drifter is about seven hundred pounds in favour of the former, the speed obtained being about the same. The more widespread adoption of the oil-engine should prove of great value to the fishing industry, as it has the recommendation of dispensing with highly skilled labour. The oil-engine is being gradually adopted; but it is felt that the forthcoming exhibition will emphasise its claims far more forcibly, and lead to a wholesale conversion to mechanical power.

### PYROPHORIC GAS-LIGHTER.

Another effort towards solving the problem of gas-lighting without a flame has been made by Dr Auer, who has discovered an alloy which is composed in part of the rare earths used in the manufacture of incandescent mantles, and which gives a large spark when rubbed with a file. Several designs of apparatus have been made to put the idea into a form that would make it commercially useful. Some of these designs are easily thrown out of gear, some require to be manipulated with both hands, and others are clumsy; but we have seen one in the form of a rod about ten inches long, with a trigger and spring which can be manipulated with one hand, and which gives very excellent results. The spark given by the friction of the small file rubbing over the pellet of pyrophoric alloy is much longer and apparently more solid than the sparks usually obtained from the electric torches in use; and one point which we cannot explain is that, although the spark emitted by the pyrophoric lighter will readily ignite the gas, it has no effect whatever upon the skin or upon the thinnest of tissue-paper. It is claimed that the sparking element will survive five thousand ignitions.

### THE MAGNETIC OBSERVATORY AT ESKDALEMUIR.

Mr G. W. Walker, superintendent of the new magnetic observatory at Eskdalemuir, has explained that the primary work at the observatory is the investigation of terrestrial magnetism. The magnetic records at Kew extended over half a century. Recently, however, electric railways and tramways have multiplied in the vicinity, and some of the lines come within a mile and a half of Kew Observatory. An electric current affects a magnet, and in the case of electric tramways the effect could be traced ten miles away. The result at Kew was that the instruments were disturbed by these electric currents, one of them to such an extent that it gave a record of the behaviour of the electric trains and trams rather than of true terrestrial magnetic effects. Thus it was resolved to erect a new observatory. The Government agreed to erect the new buildings on a suitable site, the essential conditions being complete isolation from the effects of electric railways, and a reasonable prospect that no such railways were likely to be laid in the vicinity in the future. Eskdalemuir, a parish of east Dumfriesshire, high above sea-level, was selected after careful investigation, and there is every reason to hope that the essential conditions have been secured. The new observatory is a branch of the National Physical Laboratory. While the investigation of terrestrial magnetism is the primary object at Eskdalemuir, it was considered that provision should be made for cognate subjects, chief among them being the problem of atmospheric electricity. Further, while the possibility of connection between terrestrial magnetism and weather and earthquakes is still a matter of discussion, it was felt to be wise to provide for the observation of effects, and thus Eskdalemuir will be what is known as a First Order Station for meteorology and seismology.

### TWO SELKIRK INVENTORS.

Two stone-masons belonging to Selkirk have been remarkable for inventive genius in widely different directions. The late P. S. Lang, brother of Mr Andrew Lang, and a native of Selkirk, received in 1867 from Robert Pow, stone-mason, the drawing of a velocipede, the design of which was not far removed from the present safety-bicycle. This, Pow asserted, was a drawing of a machine he had ridden some fifty years previously, which, Lang says, carries us back to about 1820. Lang and others in Selkirk were aware of the invention, but not of the date, and an old man's memory is not to be trusted as to this. It seems likely, however, that he was earlier in the field than Gavin Dalzell, of Lesmahagow, Lanarkshire, who made and rode a velocipede in 1845; or Kirkpatrick Macmillan, a Dumfriesshire blacksmith, who made and rode a machine even earlier than Dalzell. Pow, who had worked at Abbotsford while Scott was living, had various eccentricities, and carried a red handkerchief, papers, sketches, and drawings in the crown of his hat. Born in 1786, he was eighty-nine when he died. James Scott, another Selkirk stone-mason and inventor, without training, scientific tools, or mathematical instruments, has made astronomical clocks and other instruments which are the wonder of all who have seen them. They were shown at the Edinburgh Exhibition of 1908. In 1887, at the age of forty-two, Scott began, in intervals of leisure, to make his first astronomical clock, which is eight feet high and five in breadth, is driven by a single weight, keeps correct time, and supplies the motive-power for the various systems of which it is the centre. Below is a series of concentric dials, which, revolving independently, are timed to indicate the revolutions of Mercury, Venus, and the earth and moon round the sun, and the moon's revolutions round the earth, showing the correct position of any of these bodies at any hour of the day. Other machines designed and made by him have been a Jupiter clock, a solar clock, and a cheap barometer. His

tools were files, a hammer, pincers, and a strong pocket-knife—all now well worn down.

### AUSTRALIAN JADE AND RUTILE.

A correspondent writes from Adelaide, Australia: 'Although there are still large quantities of greenstone or jade in New Zealand, at Greenstone Creek, in the South Island, all the land is taken up, and it is not easy to get any fresh claim save at a high price. Recently, however, greenstone has been found in abundance near William's Town, in South Australia, about thirty miles from Adelaide. The stone is rather softer to work than that of New Zealand, and is of a lighter green, and likely to be more popular in the Emerald Isle. The men on the station have been known to carve out egg-cups of it, and also napkin-rings. It would make beautiful goblets, and is expected to be quite as popular as the harder and darker variety found in New Zealand. The same district is noted for very good mica, for which no regular market has yet been found, although it is bright and of good quality. The idea of grinding this up and using it like plumbago for ball-bearings of machinery has been suggested. In the same district is found rutile, a dioxide of titanium used to harden steel, both in crystallised form in the streams and in block. The Germans have been buying it for this purpose; but it is very heavy, and cannot at present be treated at Adelaide. It might be well for the Australian Government to secure some of these rutile-mines, so as always to have on hand a good supply of that metal, which is so useful in hardening steel plates of armoured ships. All sorts of finds are reported from Kangaroo Island, such as rare shells, gems, and also rutile. If retired British officers could come out here they would still be able to keep good horses, and, having a safe income, could support themselves while prospecting, and also be able to get some sport, and always have the possibility of finding something really valuable.'

### A SEARCH FOR NEW PLANTS.

Professor Meyer, of the United States Bureau of Agriculture, recently started on botanical research throughout Southern Russia and Asia for the purpose of discovering new plants and grains which may profitably be transplanted to America. He has already discovered a species of rice which can be grown in the United States in the same way as wheat is raised in this country. Ten years ago a peculiar kind of wheat was discovered in Southern Russia which would thrive with a rainfall of only twelve to fifteen inches in the course of the year. This was introduced into some semi-rainless districts of the United States with such success that last year no less a quantity than two million bushels of this grain was exported to the very country from which, ten years before, the seeds were obtained. Professor Meyer has been instrumental in introducing several varieties of Central Asian grapes and peaches into the States; and recently the Government experimental farms in California have been propagating a giant radish, brought back by the professor from his China and Japan expedition. Barley and oats free from hulls, found by the professor in Northern Mongolia, are now being extensively cultivated in the States, and the Japanese bamboo is also being successfully raised. Professor Meyer, in his present tour, is particularly desirous of finding a variety of the Siberian fir which will adapt itself to the higher and colder regions of America. Another object of his search will be to discover, if possible, parasites which, when introduced upon a fruit or grain farm, will attack and kill the insect-pests that often play havoc with United States agriculture. Professor Meyer goes first to the Crimea, and then across the Black Sea to Batoum, and over the Caucasus to the Caspian Sea, through Turkestan, Siberia, Tibet, Mongolia, and China.

*To Correspondents* who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

### TO BRIGHTER DAYS.

O HAPPY year, what wilt thou bring
When winter days have ceased to be?
Will flowers awaken with the spring,
And will the birds sing o'er the lea?

A snowy wreath was on thy brow
When thou didst usher in thy year;
Cold was thy icy breath, but now
The snowdrops in the land appear.

Soon wilt thou take us by the hand
And lead us by a flowery way;
Soon wilt thou deck a smiling land
With beauteous robes and sunny day.

And in the hedgerows we will hear
The nesting-birds sweet music make;
And once again on listening ear
The song of summer shall awake.

O happy year! O coming morn!
Haste ye, O haste thy laggard feet!
And, till thy gladsome spring is born
Fill thou our breasts with promise sweet.

GILBERT RAE.

### *** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

# THE PATH OF ST PETER.

By K. and HESKETH PRICHARD.

PART I.

YOU will perhaps have heard of a certain Captain Maher, and of how he gathered a troop in England and Ireland, by commission of the Count of Egmont, to serve in his immediate following. Maher found no lack of volunteers, for all had heard of the rich cities set in the fens, and looked to quilt their doublets thick with the down plucked from the well-feathered nests of the burghers. Of these he chose but the flower, a hardy crew, who later became known throughout Europe as the Gray Riders of Orange.

Peter Maher was my cousin on the mother's side; and while he was in Ireland upon this business, about the year 1552, it chanced that, my father dying as they were about to sail, I was taken aboard, and when we reached the Netherlands, was delivered, much against my will, into the keeping of my uncle, abbot of the Franciscan monastery in the city of Louvain. There I abode until I grew to be nineteen years of age, when, having no stomach for the cloister, I broke away and took service under my cousin Maher. Thus it fell out that I, Martin Carew, sometime intended for the priesthood, became a Gray Rider.

Upon the abdication of Charles V., his son Philip —lord also of other vast dominions—became king of Spain and sovereign of the Netherlands, an untoward combination from which we were yet to see many and great troubles spring. But those dark days were still unthought of, when in the summer of 1557 war broke out between France and Spain, and we rode south with the contingent from the Low Countries to join the Spanish army in Picardy. The Duke of Savoy, who was in command of the forces of Philip II., had after some feints invested the city of St Quentin.

Our post lay with the cavalry under our master, the great Count Egmont, every man of us lusting to see service under so matchless a leader.

St Quentin stood upon a rising ground above the waters of the Somme. Broad suburbs, with their rich orchards and gardens, now shady and full of leaf, covered the slopes, at the foot of which a lake, deep in places and breaking at its edges into pools and treacherous morasses, protected the city on three sides. St Quentin was held to be the key of France, and should it fall the road to Paris must lie open before us. Therefore, at the news of our advance, Admiral Coligny, rushing ahead of his troops, flung himself into the town, which was but ill-supplied with men and provisions. Meanwhile Montmorency, Constable of France, with a large army, had reached La Fére, where he lay awaiting advices from Coligny as to the means by which the much-needed reinforcements might be sent to his aid.

But the place was so closely invested, and watched with such a sleepless jealousy of attention by our troops and their newly arrived English allies, that any access seemed well-nigh impossible. Nevertheless, Coligny, aware of the deadly peril in which he stood, exhausted all the resources of his skill and long experience in the effort to outwit our vigilance; whereas we, on our side, were equally resolved that no succour should reach him. In truth, the contest was for a nobler prize than the wealthy border city. The kingdom of France itself lay in the balances.

We passed a week of long, hot days and short nights in scouring the country far and wide, thereby gaining a convenient knowledge of the adjacent parts, sometimes bringing in supplies for the camp, and sometimes, as luck would have it, intercepting the communications between the two French generals, the which no doubt occasioned not a few disappointments to those shut up within the city.

One morning in the beginning of August, Maher, with myself and a small company of our men, set forth on such an errand. During the heat of noon we rested in a wood, where the tangle of undergrowth promised safe hiding and a little spring trickled down from the hill above. The horses had been tethered, and the men were cooling their dry

[*All Rights Reserved.*]

throats with the fresh water, when the sound of hoofs approaching fell on our ears. At a word from Maher we were all back in the bushes, lying as close as snipe in a wind. A moment later a horseman appeared in the opening between the trees. He glanced suspiciously about him, then pushed up the bed of the stream to where a rill dripped from the overhanging rocks, and made shift to drink without dismounting, placing his open mouth beneath the drip of the water.

'He must be made sure of. I'll bet a hundred ducats he carries a message; he knows the country too well!' growled Maher.

Then the challenge rang out short and clear. The man started violently, turning his small, wiry horse in a half-circle, and spurred toward the open, crouching low in his saddle.

'Fire!'

Dimly through the smoke of the muskets I saw the horse rear sharply. The man's bowed body pitched out of the saddle in a heap, and then rolled over, quivering, to stretch itself at full length and lie for ever still. In a breath a dozen hands were searching him, and presently they drew from the breast of his doublet a square package firmly secured by a thin silken cord.

'Despatches!' cried Maher.

Then, bidding the men keep close and conceal the dead body, he withdrew into the depths of the wood, beckoning me to follow him.

I watched him as he carefully unwound the bindings about the packet and then proceeded to examine it, a puzzled frown gathering on his brow.

It has seldom fallen to my lot to behold a more soldierly figure than Maher's—somewhat tall and deep-chested, the burly neck burnt to a dark red by the sun, his face half-covered with a short russet beard, and lit by eyes of an extraordinary deep blue, with a spark in them like the glint of a star.

At length he looked up with a curse and a laugh. 'That old fox Coligny has learned a trick or two! What make you of this?' said he.

He handed me the packet. It contained nothing but an oblong piece of wood with notches cut at regular intervals down the longer sides, the surface being smooth and entirely blank.

'It is a sign of some kind,' I suggested weakly.

'Ay; it does not take a half-bred priest to come at so much of his meaning. A sign, no doubt; a sign, but of what, man—of what?' he replied with impatient humour.

I shook my head.

'Come, Martin, the monkish craft they taught you at Louvain during these last five years will surely help us at this pinch to read a French riddle.'

At the word 'Louvain,' and the sight of a small hole at the left-hand corner of the wooden message, a remembrance burst upon me that made me cry out with some eagerness, 'Your dagger, captain; it has a sharper point than mine!'

Maher hastily disengaged the knife from his belt, and I, handling it delicately, drew lines along the face of the wood and marked letters between them, for I began to think that my practice in certain secret matters at the monastery might now stand us in good stead.

Then, 'The cord! Where is the cord that was bound upon it?' I exclaimed.

But in his wrath Maher had flung it from him.

'I' faith, lad, I but now tossed it away into some thicket. But what of that? Go on, go on! 'Twas a silken tag, no more.'

'I cannot go on without it.'

'What! Then it shall be found. I think I cast it here.'

With some searching it was discovered, and I seized it, trembling; for this might be a moment when I could prove to my cousin that the learning he ever despised was, after all, no useless weight in a soldier's wallet. Yes, the cord bore upon it here and there scarce visible spots or touches of a dark colour; then, with a growing hope, I fitted it to the hole in the wood, and, pulling, drew it through to the end where a knot had been devised by some other hand than mine, then I laced it back and forth by the notches across the surface where my lines were drawn.

'By the twelve blessed apostles, that seems not so much amiss! Hasten, lad!' said Maher.

After adjusting my cord with care by the notches, I found that I could con the cipher with ease, the spots being disposed to fall beneath certain letters of the alphabet as I had written them. Thus was the riddle laid open to my eyes.

I read it aloud with no small pride. It was in the French jargon, and ran somewhat as follows:

'St Peter's Path found. After sunset the Bear in the Wood. Delay not.'

Maher sprang to his feet. 'Coligny has got wind of some secret way whereby Montmorency may throw reinforcements and supplies into the city. We must spoil his plans, cost what it may!'

'My monkish breeding has taught me somewhat,' I said in my boyish vanity.

'Ay, more than any honest man wots of,' returned Maher dryly, but with a laugh in his eye. 'Now, Sir Monk, canst tell me where lies the path St Peter trod?'

'Across the sea,' I answered with a happy inspiration.

Maher slapped his thigh. 'A path through the marshes! See you not?'

'But the Bear in the Wood?'

'You do not remember? Then, Martin, your monk's head lacks a soldier's eye. We passed it a day ago in the woods above the defile on the road to La Fére.'

'I remember! It is by the inn, carved in relief on a blasted pine-trunk.'

He nodded. 'A trusty messenger will be there after sunset with the plan of the path and directions for Montmorency. We must meet him, you and I.'

My heart leapt up with joy. I had not hoped he would choose me.

'The men will return to the camp and carry the news to the Count. We start at once, for we know not what delays may chance to befall us as we draw nearer to the French lines. See to the dead man. Has he scarf or colours?'

In a few moments I was attired in such of the messenger's clothing as was necessary to lend me something of his appearance. We started at a round pace in the direction of the tryst. A storm of rain blew up out of the west and lashed our faces as we rode; but the dusk gathered the earlier, and with our gray horses and long cloaks we reached the foothills unseen and passed up a gorge we knew of to the back of the Bear Inn.

The innkeeper came out to meet us—a fat, pallid man, who trembled at the sound of my guttural French; but I reassured him by an aside to Maher, from which he gathered that I was one of the German troopers serving with the French army.

'Whom have you within?' I asked roughly.

'None, master; not a man. The people below'—pointing down to the valley—'care not to linger late in these days.'

'That is well,' I replied. 'Light us a fire that we may dry ourselves, and bring us the best you can provide, quickly.'

The man hurried away to carry out my orders, Maher being perforce silent, lest his speech should betray him; while I rubbed down the great Flemish horses and fed them with a due regard to the fact that our lives might hang upon their speed within a couple of hours.

'Tell the host to show any one who may arrive into this room at once. There will be but one messenger; leave me to deal with him. But hark, linger about that fellow lest he have suspicions of us and seek to warn the messenger,' said Maher.

For an hour or so I loitered about the yard. The storm had passed away, leaving the sky clear. The rising moon began to show out over the dark trees, deepening the shadows that lay round the lonely house. Suddenly a slight sound put me on the alert. The soft beat of hoofs upon the fallen pine-needles soon became distinct. I had but a moment to warn Maher, who leant from the window and ordered me to wait in the adjoining room in case of need. Then withdrawing, he closed the shutters noiselessly.

After a short hesitation at the border of the surrounding wood, a tall man on a lean horse rode out into the moonlight. I judged him at once to be Coligny's envoy, for man and horse were splashed with the slime of the marshes. I stood back in the shadows of one of the stables, while he called for the innkeeper, who came running out, his frightened face framed in a mat of black hair.

'Are they within?' he asked, using almost my own words.

'A gentleman, my lord, who awaits'——

'Have you any other guests?' demanded the stranger, cutting short the host's explanations.

'None, my lord.'

'Then who is this?' He swung round on me fiercely, his hand loosening his sword in its scabbard.

I saluted with a careless indifference I was far from feeling, and left the answer to the innkeeper.

'A German trooper, my lord, in attendance on the gentleman.'

With a rapid movement, the stranger bent and said a word or two in the man's ear, who replied in a shaking voice, 'As I live, my lord, I have sent every soul away as I was commanded.'

'By the Path of St Peter, sir! my master is alone in the house,' I broke in, fearing delay. For I had no doubt but that a duplicate cipher message similar to that seized by us had long ere this reached Montmorency, since our man had evidently been forced to make a long round in the hope of escaping the Spanish skirmishers. Thus the escort from the French camp might arrive at any moment.

At my words the stranger gave an involuntary movement as of surprise, but instantly suppressed it; then he descended stiffly from his saddle, and throwing me the reins, bade me see to the horse's wants, for he had yet far to travel.

As he followed the innkeeper into the house I led away the tired beast into the stable and gave it due attention, for I held that a good horse, being dumb, has a stronger claim upon us for care than any Christian man. But I had not much time to spare, and soon I was stealing along the passage to the farther room.

As I gained it in the pitch-dark I felt myself clasped in a pair of soft but powerful arms, and a hot breath whispered in my ear, 'For the love of our Lady, be silent!'

With a mighty sense of relief, I recognised the voice.

'Fool, is it you?' said I hotly, as I thrust the innkeeper out with a sound buffet or two, ordering him to keep watch by the stables and to warn me if any one approached, as he valued a whole skin. Then back again to where a gleam of light athwart the darkness guided me to a crack in the old wooden partition, through which I could see and hear all that passed in the room beyond.

The fire upon the wide hearth was their only light, and in its red circle against the dark background of the blackened walls and ceiling stood Maher and the stranger face to face with swords drawn—Maher with his back to the door; the stranger, his cloak flung off on the settle behind him, ready to advance, a gaunt but stately figure with blazing eyes set in a death-white face.

'So we are betrayed once more!' he was saying. 'France has a heavy debt to settle with you, Captain Maher.'

'She shall have her chance of paying it in full, Captain Brueuil,' replied Maher quietly in his execrable French; 'and I make no doubt her turn will come—her brave sons will avenge her cause upon my poor carcass some day.'

So the messenger was no other than the com-

mandant of St Quentin himself! How important, then, must be the despatches he would trust to no hand but his own! It was little wonder that he and the captain of the Gray Riders recognised each other; they had met hand to hand more than once already in the sorties which were almost daily attempted by the besieged.

Brueuil bowed and was silent for a moment. I could have sworn he was listening for sounds from without. When he raised his head his face wore a new expression.

'Captain Maher is too noted a soldier not to be acceptable in the train of any great leader. Montmorency is a man, and knows how to reward his generals in a befitting manner, such as your puny king never dreamt of.'

'I am no servant of King Philip's,' replied Maher. 'I serve Count Egmont, the first soldier in Europe.'

'Ay, but the reward lies in the hand of Philip,' sneered the other, 'who doubtless would bestow upon you as the meed of valour one of the pasties his soul loves!'

Maher laughed carelessly.

'Ride on with me. Montmorency will give a noble guerdon to him who brings in safety the message I carry,' went on Brueuil.

'Nay, you must even carry the message and gain the guerdon yourself, Captain Brueuil—if you can! If not, I may chance to win a pasty, who knows? Guard yourself, sir; this is no time for talking folly.'

He saw through Brueuil's device, whose only hope lay in parleying till the detachment from La Fére should arrive.

'We must see to do our work,' added Maher, as with his heavy spurred boot he kicked the brands to a flame.

At this moment, without warning and regardless of all the laws of honour, Brueuil sprang upon him, shouting, '*Trahi—— A moi, Français!*'

Active as a wild cat, Maher leaped aside to escape that deadly lunge. He was a consummate swordsman, but for once he had met his match. He fought with a desperate calmness, while the other, overwrought with excitement, showed all his nation's fiery valour.

''Sdeath, you are yourself a traitor, Captain Brueuil!' said Maher with bitter scorn.

'For France—all for France—even my honour!' was the reply, hissed between set teeth.

It was a royal struggle! Each grim combatant fought for dear life, and more than life—for the kingdom of France itself.

It made a man's blood run warm to see it. The picture is before me yet. The stern faces, the half-seen movements, the glittering blades, as the fire-light flickered upon them, now flaming, now falling.

Under such circumstances victory lay with the luckiest. In a few moments the blaze failed. But the desperate conflict went on in the dull crimson glow till nothing could be seen save the glint of steel in the dusky room.

Then came a stumble, the snap of a splintered sword, a fall, and a heavy groan. I rushed round, not knowing which had fallen, friend or foe.

I found Maher wiping his sword.

'Throw on some wood,' he ordered hoarsely, then bent over Brueuil.

The Frenchman raised himself on his elbow, the glare of conflict still in his eyes, and called aloud in a last hope, '*A moi, Français!*' There was a choking breath as his head fell back against Maher's arm. 'Alas, poor France!' he murmured.

'A loyal son of France, and a pretty swordsman!' said Maher, as he laid him gently down. 'Had they not been starving in St Quentin it might have gone hard with me.'

*(To be continued.)*

---

## THE STORY OF THE GERMAN NORTH SEA COAST.

TO most Britons the North Sea is known chiefly through pleasant summer holidays spent on its shores—shores by which the rocks hold their own in the contest between land and sea north of the Humber. Yet to the south of this river there is another story to tell, even in England. The visitor to Norfolk or Suffolk will often be told of the lost city which lies buried underneath the waves off Southwold—the tale of the ancient walled city of Dunwich, with its fifty-two stately churches and religious houses, its bishop's palace, and its royal residence, all of which the waves devoured piecemeal, church by church and house by house, until, in the eighteenth century, it had become nothing but a village of four hundred and fifty inhabitants. Now, alas! there is not even a trace of it left.

All this is but a trifle compared to what the North Sea has done on the coast of Germany. Here, in past centuries, the terrible north-west wind swept straight down on a flat coast, protected only by dikes, with appalling results—dire catastrophes the like of which has never been known in England. There has been a lull in its attacks in recent times, so that the really great floods have not been repeated in this present generation; but, some day, what has happened before may perhaps happen again—a south-westerly gale may sweep up the Channel, carrying before it a pent-up mass of water, only to encounter another gale sweeping down from the north. Then, and particularly if it be the season of the spring-tides, down will go the dikes once more, and the tale of the last terrible flood of Christmas Day 1717 will be repeated.

In this inundation, in German Friesland alone,

two thousand seven hundred and eighty-seven men perished in the waves; one thousand and thirty houses sank under the sea; and two thousand two hundred and fifty horses, nine thousand five hundred and fourteen cattle, two thousand five hundred and eighty-nine sheep, and one thousand and forty-eight pigs were drowned. Pastor Hieronymus Brückner, of Wittmund, wrote in his parish register a lengthy account of this catastrophe, a transcript of which lies before the writer. 'On Saturday before Christmas Day,' wrote he, 'the south-west wind blew a gale, and in the evening about ten o'clock the north-west wind arose and blew fiercely, by which the water coming up the Channel from the Atlantic Ocean was heaped up, and destroyed the dikes about midnight, when the moon entered into its last quarter. So that the whole of Ost-Friesland was invaded by the sea, and the greater part of the district of Wittmund lay under water. . . . In the inn at six o'clock in the morning there was two or three feet of salt water.'

Wittmund lies about six miles inland, and about the same distance to the west of what is now the great German war-harbour of Wilhelmshaven, then only a hamlet called Heppens, situated in a marshy district, Rustringen by name, the whole of which had but three hundred inhabitants. What would happen to Wilhelmshaven nowadays if such a flood took place again? For it is more exposed than Wittmund, and lies on the very edge of one of the North Sea's greatest conquests from the land—the Jade-Busen, an immense inland bay containing one hundred and ninety-five square kilometres of lost land, in shape for all the world like a great bite taken out of the earth by the sea.

Pastor Brückner's narrative ends thus: 'And this, our worst and sixth Christmas Day flood, is the most terrible that has happened since the frightful one that took place near Emden in 1277. But (thank God!) we are more fortunate in our time. For [he was evidently very loyal] our most noble and ever-to-be-honoured Prince and Lord, the Lord George Albert, Prince of Ost-Friesland, Lord of Esens and Wittmund, has extended his most high, princely, and land-fatherlike patronage and charity in compassion over the whole of Ost-Friesland and Harringerland, and has come to our assistance in the most open-handed manner, both for the repairing the dikes, the renewal of the crops, and the comfort and succour of the sick and homeless.' God's blessing, also, had not been wanting, wound up the good pastor; for in the following year they had the fattest crops ever known. Wittmund parish itself, being far from the sea, suffered least of any; but in Wittmund district three hundred and seventy-three men, two hundred and fifty-one horses, eight hundred and fifty-five cattle, one hundred and eleven sheep, and two hundred and eight pigs were drowned. Eighty-six houses were also destroyed.

A little consideration of the past history of this coast shows that the sea has been quiescent for a century or so before, only to renew its attacks in greater fury than ever. Take the history of the Jade-Busen. Wilhelmshaven lies near the mouth of the river Jade, ten or twelve miles east of which, only separated by the peninsula of Langwarden, lies the mouth of the Weser. There is nothing to the north of Langwarden nowadays but *watten* or mud-flats; yet in the year 1066 the castle and village of Mellum carried the peninsula five miles farther out to the north. Castle and village alike vanished in the flood of that year.

For the next one hundred and fifty years the North Sea was busy elsewhere on the coast, but in 1218 it set to work in earnest to cut out the Jade-Busen. Rising, as usual, in the night of 17th November, it broke down the dikes and wiped out four parishes to the south-west of what is now Wilhelmshaven—Jadeleh, Wardeleh, Arngast, and Dangast. Part of the last still survives as a watering-place, the water being deep and clear at this spot.

After this there was a respite; and, save for a nibble here and there, the Jade was left alone for three centuries. But in 1511 the great *Marcellus-flut* of 16th January took place, and the rest of the Jade-Busen was formed, a vast tract of land being finally lost. Part of Rustringen itself was cut away, and thus the present-day home of the German navy was brought to the river's brink.

The remainder of the German North Sea coast has much the same history. Just opposite Emden, on the extreme west of German territory, lies the Dollart, another great bite of the sea. This was formed by the inundation of the 14th December 1277, which Pastor Brückner mentions; and no less than three hundred and eighty-five square kilometres of cultivated land was lost by it. Fifty parishes vanished, and, says the monkish writer of the chronicle of Wittewerum, 'in the west of Stavoren, as far as Laubach, thirty thousand souls were drowned, and from Laubach to the Ems twenty thousand.' Frightful as was this last catastrophe in the loss of human life involved, it extended over a great area. Yet it did not wipe out a whole province, as happened in 1634.

On the 11th October 1634 the island province of Nordstrand, on the west of the duchy of Schleswig-Holstein, was swept under the sea. The wealthy town of Rungholt and about thirty-five parishes were destroyed. Seven thousand six hundred men lost their lives. All that now remains of Rungholt is the 'Rungholter Sand,' between the islands of Pelworm and Nordstrand. The province of Nordstrand is now a vast waste of mud-flats, covered by the sea at high-water, and interspersed with numerous undiked and unprotected islets called Halligen:

> A land that is lonelier than ruin,
> A sea that is stranger than death.

Of all the strange sights which Northern Europe has to show, surely none is stranger or weirder than the Halligen. Generally a green hillock rising

straight out of the water, sometimes presenting the appearance of nothing but a single house standing in the midst of the waves, sometimes a collection of houses, and always the home of innumerable wild-fowl, the Halligen are the veritable realm of the wild ducks, decoys for which are numerous throughout the islands round them.

They are a strange but kindly people these German Danes, with a wealth of folklore and old superstitions of their own; but their islands are doomed, and some day will go the way of their ancient province itself.

The floods I have described were great floods. What of the lesser ones? They are too numerous to mention in detail. To sum them up, they amounted to fifty-four in the sixteenth century, fifty-one in the seventeenth, and fifty-three in the eighteenth—all causing great loss and damage. In the first half of the nineteenth century there was an increase, no less than thirty-two inundations having been recorded, the worst of which was the flood of 3rd and 4th February 1825, in which seven hundred and eighty-nine men and forty-five thousand head of cattle were drowned, and two thousand four hundred houses destroyed. No place along the whole hundred miles of German coast escaped unscathed, and no place was so badly damaged as Emden, where the losses were estimated at fourteen thousand thalers. Well may the proverb run, '*Frisia non cantat.*'

One remark which German writers on the subject frequently make is that the storms always were most terrible when they coincided with the time of the new or the full moon. Volcanic phenomena in the bed of the sea are also said sometimes to have accompanied them.

Wilhelmshaven, as a name, dates from the 17th June 1869, when the Emperor William I. opened the harbour. Before this date the great *fangdamm* or earth-dike round the town was many times broken down by the sea. With the teredo to honeycomb them, piles are not serviceable for any length of time, and nothing but blocks of stone can oppose an effectual resistance to the waves. And in the whole of the sandy 'pancake' (as the natives call it) of Ost-Friesland there is not enough stone to throw at the stray cur which barks at the wayfarer's heels. Even the roads in the towns have to be paved with bricks. All the dikes are built on the old methods. Who shall say that it is not now possible for another great catastrophe to overwhelm Wilhelmshaven or Emden? They are the only German towns which are—which ever have been—directly exposed to the ravages of the North Sea.

---

# LAURISTONS.

By JOHN OXENHAM,

Author of *Barbe of Grand Bayou, Giant Circumstance, John of Gerisau, Great-Heart Gillian,* &c.

## CHAPTER XXIX.—HOW THE NOOSE LAY ON THEIR NECKS AT TIMES.

WHEN the first frost touched the chestnuts and poplars in the Castle Bear woods to brighter flame, and the days were drawing in, and the chill of November was settling on the country-side, Lady Lauriston returned to Grosvenor Place.

Dr Berkeley, when he saw her, took great credit to himself, and made voluminous notes of her case and his treatment of it for future use. 'But,' said he, as he eyed her carefully, 'you mustn't overdo it. You are not really as strong as you think you are.'

And Lady Lauriston was quite aware of it.

'*Spirituelle,*' the marquis's word, described her exactly, for the pure white flame of the spirit within seemed to shine more brightly than ever through the frail tenement which it at once illuminated and animated; and to those outside her own most intimate circle she seemed almost more spirit than body. But it was a brave and charming spirit which strove its utmost, and very effectually, to conceal all sign of bodily weakness beneath a many-coloured cloak of valiant cheerfulness, undaunted vivacity, and a keen and unfailing interest in the doings of all about her. What it cost her at times she alone knew.

So the varied household at Grosvenor Place was, on the surface, an extremely cheerful one, in spite of—partly because of—the sombreness of its hidden background.

Marriage had mellowed Aunt Charlotte in the most wonderful way; for she had, after all, and when the possibility seemed past, attained to something of the ideals of her frosty youth. It was something to have become a Marquise of France, even though the marquisate was, for the time being, in abeyance, and the marquis's head was safe on his shoulders only so long as he remained outside his native land. She had with the utmost ease and elegance assumed the graces of manner and deportment becoming her new estate, and from the heights of her Olympus beamed like a complacent goddess upon her more ordinarily situated relatives and friends.

And monsieur! Oh, monsieur was perfectly satisfied and happy. The present was secured beyond reach of harm—at least he believed so—and the future hung before him like a golden veil, a golden veil behind which lay his broad lands and châteaux, his dignified appointments at Court, and all that made life worth the living; and any day the veil might lift and endue him once more with the solid realities of which for the moment he could only hopefully dream.

To Lady Lauriston his manner was particularly deferential and kindly, with something of what in a younger man might have seemed like reverential admiration. He was a man of many experiences. Perhaps he saw more deeply than most. Possibly he perceived that this unlooked-for accession of strength pertained more to the spirit than to the body, and admired the fine courage that animated her. If he ever sought a reason for her sudden redetermination for life, it is certain that his widest thought never came within measurable distance of the truth.

For the great banking business rolled steadily on its course under the firm guidance and unremitting attention of its new head and his faithful lieutenant. Their lives were devoted to it, bound up in it, in a way undreamt of by any but themselves. They were indeed as prisoners bound to the wheel. It was a terrible, a heart-breaking, a soul-searing road these two travelled, but in all good faith they deemed it the only road possible to them.

They had their times of gratitude and of something approaching jubilant hope, when their cautious plans were crowned with success; and they had their dark days, when their souls turned with loathing and revolt from the work they had to do to stave off disaster, simple-seeming acts behind each of which dangled the hangman's noose as clear to their sight as the desks at which they sat, twisting, with open eyes, the rope that might end them. The house had its trusty correspondents all over the Continent. There were huge subsidies, a continuous stream of gold, to be conveyed from Britain to her allies. What safer means of transport than those at the disposal of Lauristons? There were huge contracts for the feeding of the troops fighting losing battles for the world's welfare and for the replacing of the supplies of all kinds which were constantly falling into the enemy's hands. To whom should harassed contractors turn for financial assistance but to Lauristons? And in return there was news of moment to be picked up by those who hovered on the skirts of the armies. And how could such information be turned to better account than by sharing it with Lauristons? It paid a man handsomely to risk his life even in the obtaining and quick conveyance to the house of news such as that, and Lauristons turned it all to account, and no man ever regretted carrying his wares to that market.

These were the credit items in the grim account. *Per contra*, there were—in spite of all their care and foresight—sudden hazards and hairbreadth escapes from discovery and ruin which momentarily jangled their nerves and then strung them to their tightest. There were moments when their own lives and all that elaborate superstructure reared with such mighty labours and such grievous cares rocked literally on the flicker of an eyelid.

As, when John Sax was hurrying out of the Bank of England one day with an urgently needed hundred thousand pounds in notes in his breast-pocket, the proceeds of a quite unauthorised sale of Consols belonging to old Lord Viveash, he was met on the very steps of the Bank by that antique nobleman himself, with a jovial, 'Ah, John Sax, you are the very man I want!'

'I am entirely at your service, my lord. What can I do for your lordship?'

'That young cub of mine is in trouble again.'

'Ah, ha! How much?'

'Forty thousand, he says, so I expect it's about twice that. I thought I'd sell out those Three per Cents. I want some myself also. How soon can you get me the money?'

'If you will accompany me, my lord, you can have it by the time you sign the necessary documents. Lauristons never keeps its friends waiting. It's a bad time to sell, of course. Prices will come up again in time.'

'I know! I know! But you know, as well as I do, John Sax, that a matter of this kind can't wait for prices to come up again. What are they now?'

'Sixty-five and a half.'

'Phew! Well, needs must when the devil drives.'

So they got into a hackney-coach and jogged along to Lauristons; and while Sir Charles discoursed quietly with my lord, John Sax prepared his documents, and presently the lively old gentleman trotted away complacently with the hundred thousand pounds in his coat-pocket and high eulogy in his mind of the prompt and business-like methods of his trusty bankers. And his trusty bankers turned feverishly elsewhere for relief from their own immediate pressure, and spun another twist of the rope that might hang them.

There were many such narrow escapes. But 'you can get used to anything,' as Jerry MacClootie and Mavie said, and they grew inured to the risks; and but for the fundamental stain upon the game Charles Lauriston would have found the hazard of it not without a certain grim fascination.

At the end of the first year after Sir George's death they were not far from one hundred thousand pounds nearer salvation, and they pressed on with zest, as men of old fled before the Avenger towards the City of Refuge. But it was a ghastly business, you perceive, and not to be palliated or condoned by so much as the shadow of a hair. And yet, under their stern conviction of the terrible necessities of the case, these two lived that grim life, year in, year out, till the end came; and wore calm faces under it all, and said to themselves that they had no choice in the matter.

Old John Sax's face, indeed, had, by watchful schooling and custom, long since passed the point where any inner emotion whatsoever could produce upon it the veriest flicker of change. Always gravely intent upon the firm's concerns, nothing more was looked for in him.

But upon Charles Lauriston the matter pressed more hardly, since of him very much more was expected and had to be provided, cost what it might. In the home and in society he must still bear the assured cheerfulness of the successful man

of affairs. The magnitude of those affairs might, indeed, condone a touch of increased gravity in face and manner; but no more than a touch, for an overgrave face might point the world to an adverse trend in business matters, and that was to be avoided at any cost. And so, since the time his soul was racked with anxieties and torments past the bearing almost, that which had been natural to him had to become a mask, hard to wear as that of iron, and therein lay one of the thorns of his punishment.

But if outwardly the strain made for something of stiffening and hardening, inwardly his torture of self-humiliation made for nothing but softening. None ever heard from him harsh comment on men or things. If he had to condemn, it was done temperately and without venom, for within him was always the thought, 'What am I that I should judge any man?' When one of his clerks, under some sudden stress, was found embezzling the firm's money, Sir Charles called him into his private office, talked gravely and quietly with him, heard all his troubles, and in the end helped him to a fresh start in the New World. And John Sax understood and raised no objection, though he was doubtful in his own mind as to whether, for the sake of example, that was quite the proper way to treat a defaulter.

And in the home—to his wife and the children, and even to Aunt Charlotte—his manner was tenderer than ever, even though his face was grave and inclined to stiffen at times. For within him there was always the thought, 'If things go wrong, and I bring them all to shame, they shall at all events remember that I loved them dearly. And if I have to go, even by that road, they shall still think of me tenderly.'

Like the lovable sinner of old, his sin was ever before him; but his punishment was ever with him, and he bore it without flinching.

So the weeks and months spun steadily their lengthening tale—of increase and expansion for some, of ever more firmly riveting fetters for others; for some, devoured all too quickly the short time that was left to them, and for all drew on remorselessly towards the things that had to be.

The Peace of Amiens brought shoals to many nets and solid advantage to one Englishman at all events.

When M. de Talleyrand fled across-Channel from the madness of the later Revolution, he made, among others, the very desirable acquaintance of Charles Lauriston. When he returned to France and took office under the First Consul he was able at times to send the banker interesting items of news for their mutual benefit. Through him Sir Charles heard of the certainty of at all events a temporary cessation of hostilities, and he and John Sax set to work with might and main to turn it to profitable account. Every pound they could lay hands on, by hook or by crook, was quietly invested in such securities as they deemed likely to respond most sympathetically to the announcement of peace.

The results justified their highest hopes. Their private balance-sheet—which if it had come under any eyes but their own would have knotted the rope irrevocably round their necks—showed that on December 31, 1802, their liabilities to their private clients had been reduced to something under three-quarters of a million. They might possibly have done still better by holding on, but the risks they were knowingly taking in one direction were so enormous that it disposed them to excess of caution in others. They were like a general who had boldly cut loose from his base in order to outmanœuvre the enemy, and was determined to risk no check through lack of foresight and precaution.

When General Lauriston came over with the ratification all London went wild with joy, harnessed itself to his carriage, and dragged him through the City in triumph. And when all the necessary ceremonials were over, Lauriston took an opportunity of going up to Grosvenor Place to dine with his namesake, the great banker, as M. de Talleyrand had suggested to him to do.

It was a visit pregnant with results. At the moment we are concerned with only two.

General Lauriston, a fine, frank soldier who had seen enough of the seamy side of warfare to sicken most men, was so charmed with the household at Grosvenor Place that he instantly claimed relationship, and cemented their acceptance of him by unofficially spending much of his short stay there. Possibly the far-sighted M. de Talleyrand had suggested this also.

It is an undoubted fact that Lauriston never mentioned the matter in reporting his doings to the First Consul, who would most certainly not have approved. For none knew better than he how powerfully the resources of the great banking house had been used in the service of the various combinations against him, and more than once he had told his General that the only thing he had against him was his name.

It was over their cigars after dinner, on the occasion of the General's first visit, that Sir Charles asked him pointedly, 'How long will it last?'

And after a pause, punctuated by three slow puffs of smoke, the General said quietly, 'You have never met him, have you?'

'Never.'

'If you had you would know how next to impossible it is to answer that question. There never has been a man like him. Sometimes I wonder if it is not true, as many folks believe, that he is more than man.'

'Ah,' said M. de Montessonne with a quiet chuckle, 'the Devil!'

'He is just over thirty,' said the General oracularly, through his smoke.

'By which,' said Sir Charles presently, when

nothing more came, 'you mean that his career is only beginning.'

'Most men have hardly begun at thirty.'

'So that we may expect much more of what we've been having?'

'He is needing rest, and the country still more. At present he is very busy with the lawyers compiling a new code. It is said to be very remarkable. He is also busy making bishops and archbishops, and compiling a religion. He is also playing foster-father to the arts and sciences. But, *mon ami*, admirably as he does all these, that is not his *métier*. First and foremost, and all the way through, he is soldier. *Voilà!*'

'I understand,' said the banker, and decided on a cautious course. It was during the General's intimacy with his friends at Grosvenor Place, also, that the idea of the Marquis de Montessonne's return to France came up.

This was now made possible by the amnesty offered to all but a select few, whose interests were so absolutely opposed to Bonaparte's that reconcilement was out of the question.

It might have been difficult to say by whom the idea was first mooted. Turning the matter over in his mind afterwards, Charles Lauriston half-convinced himself that the first seed had been skilfully dropped by the General. But it was hard to say. Possibly the very long finger of M. de Talleyrand had something to do in that pie also. And not impossibly the still longer finger of a First Consul who dreamt imperially may have prompted M. de Talleyrand thereto. For the Court of an Emperor can stand heavier decoration than the levees of a Consul, and a leavening of the new order with a certain carefully selected representation of the old would undoubtedly make for both effect and stability.

Whoever started the idea, it no sooner came to the ears of Madame la Marquise than it filled her head to the exclusion of all else. When Charlotte Lauriston set her mind on a thing, she could, as we know, make everybody about her extremely uncomfortable until she got it. And Madame la Marquise was no whit behind her.

'Of course we go back, Etienne,' said she. 'Why, what else are we here for?' By which, of course, she meant, 'What on earth else did I marry you for?' and the marquis quite understood.

There would, of course, be the oath of allegiance to take, and the idea of that stuck somewhat in monsieur's throat.

'How long do you expect him to last, M. le Général?' he asked cautiously.

'He is young,' said the General. 'But war is full of chances.'

'France, at all events, seems to accept him,' said the marquis musingly.

'He is a born leader of men,' said the General.

'What has been may be. The people have tasted freedom and their own power.'

'They have learned that loose reins do not make for security. He is the only possible driver.'

'You think so?'

'No; I am sure. France needs a man. With all apologies, monsieur, your friends the Bourbons are but spoiled children. The country would rise as one man against them. You will find things very different.'

And the marquis pondered the matter and carefully weighed the possibilities, but knew perfectly well all the time, in his own mind, that madame would have to have her way if life was to hold any further peace for him. And finally he sent M. de Talleyrand, through General Lauriston, an offer—the oath of allegiance in exchange for such reinstatement as was possible.

And, to make an end of that matter, Talleyrand introduced the matter to his master, and delicately suggested that a member of the old nobility like M. de Montessonne, who had married an heiress of good family, with five million francs, and was too old to do any mischief, would be a decided acquisition to the new Court.

Bonaparte inquired the name of the heiress.

'Lauriston, daughter of the banker.'

At which the First Consul pouted unpleasantly, and then, after a moment's consideration, said, '*Soit!* They will be useful to us.'

And the matter was settled. But whether Bonaparte spoke of Monsieur and Madame de Montessonne, or of madame's five millions, M. de Talleyrand was not sure.

*(To be continued.)*

---

# RUBBER-GROWING IN THE MALAY STATES.

By a PLANTER.

MALAYA, the land of perpetual summer, is the new home of the rubber-tree. Cultivated here under ideal climatic conditions, with a plentiful and evenly distributed rainfall throughout the year, a temperature varying from about seventy degrees minimum at night to ninety degrees maximum by day, and practically no change of season, growth is rapid and continuous. To say that one can see the trees grow is scarcely an exaggeration, as the young nursery-plants will increase in height at the rate of half an inch per day, well-grown specimens being about six feet high six months after planting the seed.

The first point for the planter to consider is, of course, the selection of land. The rubber-tree (*Hevea brasiliensis*) is not, as was at one time supposed, a swamp-growth; well-drained land is

essential to the health of the tree. Given this condition, and sufficient depth, it will grow and flourish in almost any sort of soil that occurs in the peninsula.

Practically the whole of the country, with the exception of plantations already established, is virgin jungle. Patriarchal trees, some of immense girth, but mostly with comparatively slender trunks, rear themselves aloft one hundred feet before branching, in their struggle for light and air, their crowns forming a dense canopy far overhead; in the cool, damp twilight below grow large tree-ferns, rare and beautiful orchids, thorny canes, and creepers, huge snaky vines hanging in fantastic loops and convolutions from tree to tree.

From the rich, moist earth underfoot, fertilised for untold ages by decaying leaves and rotting wood, spring weird and gruesome fungi in clumps and patches. Mosquitoes swarm, and leeches search out the joints of one's armour in their lust for blood. Larger game, such as the tiger, sladang, pig, and deer, abound, but are seldom or never seen, as they all avoid contact with mankind.

Away from the Malay settlements the only tracks are the tortuous paths of the Sakai, the true aborigines, who, armed with bamboo blowpipe and poisoned dart, capture squirrels and other small game to supplement their diet of rice and fruit; retreating deeper and deeper into the jungle as larger areas are opened up.

Felling and clearing are usually done by Malays, on contract. They are very expert at this work, using a tiny wedge-shaped axe weighing scarcely a pound, mounted on a long, thin, flexible handle, which looks an absurdly inadequate tool with which to lay low the giants of the forest. The axe-head is, as it were, 'flicked' into the trunk, the spring of the handle being brought into play, knack more than muscular force being used in its manipulation. The light weight does not tire the arms, and a man can continue all day 'pecking' at trees in this way with surprising results.

All the trees being down, and the branches lopped, so that the whole of the felling lies as compactly as possible, they are left for about three months to get thoroughly dry, and as soon after this as a spell of four or five days without rain occurs the felled area is burned off in one terrific bonfire.

This is one of the most impressive sights imaginable, if the clearing is a large one of, say, five hundred acres—no uncommon size. A gang of men, furnished with torches, line up at intervals of about twenty yards across the far side of the clearing, facing the wind, and at a given signal advance all together against the wind over the clearing, firing the dried leaves and twigs as they go. Little spurts of flame and smoke mark their progress, which increase in volume, spread, and unite with appalling rapidity, until the whole area is a crackling, roaring furnace. The intense heat draws in furious blasts of air from all around, which go eddying and swirling into the heart of the inferno. Blazing leaves and sticks are carried high in the air by the uprush of heat, to be caught by the wind and scattered over miles of jungle. Great volumes of smoke, white, pearly-gray, brown, and inky-black in colour, rise and unite in undulating billowy masses, spreading into a murky pall, obscuring the sun, and finally mingling with the clouds and slowly dispersing. A shower of rain often follows, precipitated probably by the disturbance of the air and the presence of smoke particles. This operation is not unattended with danger, as should the line of men get out of touch with one another, it is quite possible that the laggards may be surrounded by the fire. Again, should the wind change suddenly when the centre of the clearing is reached, the coolies run a great risk of being suffocated by smoke and overtaken by the flames. Accidents, however, are singularly rare, and one has no difficulty in obtaining men for this work, the excitement, bustle, and spectacular nature of the whole proceeding appealing strongly to the sporting instincts of the Malay.

It is soon over. In about an hour all the leaves, brushwood, &c. have burned out, and a smoking abomination of desolation is left, a few inches deep in fine, powdery ash, covered with black and smouldering logs, with here and there the unfelled trunks of dead trees still blazing on high, which fall one by one with a mighty crash as they burn through, scattering showers of sparks and raising huge clouds of the fine ash.

After the conflagration, the smaller débris is collected into heaps and reburned, until the ground is sufficiently cleared to admit of being lined up for planting. Lining is usually done with a thin rope several hundred feet long, marked at intervals corresponding with the distance the trees are to be planted apart—fifteen, seventeen, or twenty feet, as the case may be. A marking-peg is stuck into the ground at each point, and all is now ready for holing and planting.

Nurseries have been prepared some six or eight months previous to the burning, beds about six feet wide, with shallow trenches between, having been made up, and the seeds (resembling large brown beans, mottled with gray and the size of small chestnuts) planted about six inches apart. The nursery plants should now be about six feet high, with a stem about as thick as one's thumb at the base, covered with thin bark for two-thirds of their height.

Numbers of coolies, armed with *changkols* (a sort of glorified hoe, with a large, heavy blade at right angles to the handle), are now turned on to the lined clearing to make ready the permanent homes of the rubber-trees. Holes about two feet wide and two feet deep (the larger the better) are now dug at each marking-peg, and filled in with earth, wood-ash, and burned débris scraped off the surface. This is left to settle down until the weather is favourable for planting.

A raid is now made on the nursery, the largest and best-developed plants being selected. These

are pulled up bodily, the leafy tops and green sap-wood chopped off, and the thin ends of the tap-roots cut away, reducing the plants to bare sticks, with about eight to twelve inches of root-wood at the base, which are now known as stumps. These stumps are tied up in bundles and conveyed to the clearing. A hole of sufficient depth is made with a stake in the centre of the filled-in earth at each mark, a stump dropped in, the earth rammed tightly in all round it, and the planting is complete.

All now depends upon the weather. Given favourable conditions, with plenty of rain, buds will appear in about a fortnight, which quickly develop into new shoots, and growth from this point is rapid and vigorous, failures being few.

There are other methods of planting when stumps are not available—namely, seed at stake, basket-plants, and transplanting; but stumping is the method most in favour.

Weeding, the planter's nightmare, must now be taken vigorously in hand. This is the most expensive item in the estate budget, and if neglected weeds will appear as if by magic. The worst form of these is *lalang*, a coarse, rank grass, growing to a height of six feet, with tough, wiry roots going very deeply into the soil, which is very difficult to eradicate, and soon smothers out the young rubber. Now ensues a long round of monotonous work. Weeding, weeding, and again weeding; roads to be cut, drains to be dug and kept in order, white ants and diseased trees to be watched for, labour disputes to be settled, accounts to be kept, the insatiable maw of the London board of directors to be fed with voluminous reports, and the thousand and one details of estate-work to be attended to.

In this way, varied with occasional bouts of malaria, the five years of waiting slowly pass.

Meanwhile the trees have added leaf to leaf and branch to branch, have blossomed, and produced their first crops of seed, and in place of the desolate wilderness of our own creation, we have endless vistas of interlacing greenery, the bare earth under the shade of the trees (now some thirty to forty feet high) carpeted with the fallen leaves.

Well-kept roads intersect the estate; picturesque bungalows, surrounded by flower and fruit gardens, and maybe tennis-lawns, are in evidence.

Coolie-lines, more or less solidly built, are scattered about, under and around which in the evenings the workers gather in light-hearted crowds, cooking their rice over small open fires, singing, dancing, chattering, and discussing the momentous happenings of the day. A crowd of laughing children, clad in the garb of Eden, are chasing each other around, while chubby and tubby infants sprawl and kick on the ground. At sunset such of their elders as are Mohammedans spread their praying-mats, turn their faces to Mecca, and kneeling down, bowing their foreheads to the dust at intervals, recite their evening prayers, with a complete absence of self-consciousness and an utter disregard of onlookers. They are in general a cheerful, contented crowd, although fights sometimes occur, the caprice of some fair one being usually the cause. Kissing goes by favour the world over.

At this stage 'a young man's fancy lightly turns to thoughts of dividends,' or something to that effect. Trees are measured, and those of, say, twenty inches in circumference are marked out for tapping. This is done in a variety of ways, but the general principle is the same in all cases.

Usually a vertical incision is first made, from three to six feet long, according to the size of the tree, and spiral grooves running half-round the tree are cut at twelve-inch intervals, leading into the vertical channel, at the bottom of which a small cup is placed to receive the latex. The spiral channels are reopened daily or at short intervals by paring away a thin shaving from the lower edge of the cut; this is continued for several months until the cut has been widened to six inches or more, and the daily flow shows signs of falling off. The tree is then rested and time given for new bark to fill up the cuts, after which the other half of the tree is operated upon in the same manner.

The latex is collected from the small cups into milk-cans, and is taken to the curing-house for coagulation and conversion into the particular form of output of the estate.

In the preparation of sheets and biscuits little or no mechanical apparatus is required. The latex, which resembles cow's milk in appearance, is strained into pans, oblong or round, accordingly as sheets or biscuits are required, a minute quantity of dilute acid is stirred in, and in a few hours coagulation is complete, and the rubber can be lifted out in a flocculent mass, leaving a small quantity of clear liquid in the pan. This slab of soft, spongy rubber is first rolled out by hand, which expresses the surplus water, at the same time compressing and toughening it; and it can then be passed through rollers, some such machine as the ordinary household mangle being used.' It is now in the form of a thin sheet or biscuit, opaque, white in colour, and only requires a few days in the drying-house, when it changes to a clear amber, and is the 'fine pale sheet' of the Mincing Lane auction-rooms. On large estates other methods are necessary to deal with the heavier output and economise time and labour.

The rubber is then turned out as 'crepe,' 'block,' &c., and washing-machines, vacuum-driers, and hydraulic-presses play their part. The use of machinery in preparation makes little difference in the value of the finished product, but is essential to speed and economy. The first advance in this direction was the introduction into the country of the washing-machine, by the aid of which 'crepe' rubber is produced. This machine consists essentially of two iron rollers operated by engine-power, capable of adjustment from practical contact to about a quarter of an inch apart, and revolving at differential speeds. While at

work a constant stream of water is flowing over the rollers. Through these rollers the freshly coagulated rubber is passed. Owing to the differential speed of the rollers, the rubber, while being pressed, is torn into shreds, the water washing out any impurities, such as bits of bark, earth, &c., which may have accidentally found their way into the latex during collection. The natural adhesiveness of the material causes the shreds to reunite, and come from the rollers in the form of a thin granulated sheet, which is again passed through the machine until all trace of foreign matter is removed. This process does away with the necessity for the cumbersome pans and dishes, and saves time and space in the drying-house, as the 'crepe' is much more rapid in drying than solid sheet rubber.

On a few of the more up-to-date estates vacuum-driers have been installed. This apparatus consists of a sort of large air-tight safe, fitted with a series of hollow, steam-heated shelves. On these shelves the 'crepe' is laid, the door closed, and the air exhausted by an air-pump. Under these conditions the time of drying is reduced from days to hours, and the rubber, softened and rendered slightly plastic by the heating, is then packed tightly into iron moulds and put under hydraulic pressure until cooled. The final result is a solid, homogeneous block of perfectly pure, dry rubber, pale amber in colour, of excellent quality, and in the best possible form for packing and transport.

It appears inevitable that in the not far distant future it will be to the cultivated plantations that we must look for the bulk of our supplies, and I have here endeavoured to give the reader some general idea of the work entailed in the production of this most useful commodity, which now, in one or other of its myriad forms, enters so largely into the daily life of each one of us.

---

# ONE HUNDRED 'FIRST NUMBERS.'

## NOTES ON 'No. 1' OF A HUNDRED JOURNALS.

By DAVID WILLIAMSON.

PART I.

THEY say there is only one newspaper in the world the editor of which never receives a letter signed 'A Reader from the Commencement.' This is the *Pekin Gazette*, which has existed for many hundreds of years! Several years ago I began collecting the 'first numbers' of new journals and magazines. It has proved an interesting hobby, and perhaps I may be able to convey some of the interest to those who read these notes on one hundred first numbers selected at hap-hazard from about three times that number.

### SUCCESS AND FAILURE.

I find that, roughly speaking, only one in five of the scores of first numbers in my collection represents a success. The total sum of money lost in trying to found newspapers and magazines during the last twenty years must be enormous. Probably it approximates to two million pounds, for the capital lost in vain attempts to found daily papers in London alone must be at least one million pounds! There is hardly any way in which money can be lost on a large scale more quickly than in the newspaper world. One London daily newspaper dropped one hundred and fifty thousand pounds before it 'turned the corner.' An experienced newspaper proprietor said the other day he would not think of starting a new daily journal with less than a million capital. Even a little penny weekly paper has lost eleven thousand pounds in nine weeks, to my personal knowledge; and a monthly magazine dropped forty thousand pounds in four years' vain struggle to establish itself.

### THE PATHOS OF DEFEAT.

As I survey my hundreds of first numbers I cannot help realising the pathos of the situation. Four-fifths of these periodicals have died after gallant efforts and high hopes. Every promoter has thought his or her idea was certain to be rewarded with success. Thousands of editors, writers, artists, printers, and publishers have been losers by the failure which has come to the great majority of these papers and magazines; and yet each year produces its long list of new ventures, of which only one-fifth will survive. Even if survival comes to the fittest, financial success is not always the result, for a large number of periodicals are carried on at a loss.

A famous editor said to me long ago, 'If a paper or magazine does not succeed after a fair trial, cut your loss by stopping it immediately. There is no virtue in fighting against the inevitable.' That editor acted on his own advice, and withdrew three of his enterprises after a short life. It needs little imagination to sympathise with the host of people who have been linked with the first numbers which soon were followed by last numbers. What hopes of wealth and influence lie buried within those pages! Many a young journalist thought the success of some old magazine was so easy to emulate, only to learn by bitter experience that there is no accident in any success; it comes as the reward of originality, ability, and incessant hard work. One fact I venture to assert without fear of contradiction, and that is the exceeding rarity with which early failure is retrieved by later success. If a newspaper has not got its secure footing within two years, and

a magazine within three years, the likelihood is that they never will.

Now let me turn to my collection, premising that I have made the selection at random, and have omitted purposely periodicals of recent date.

### DAILY PAPERS.

More than twenty-one years have passed since I bought the first number of the *Star*. It was then edited by Mr T. P. O'Connor, M.P., and had regular contributions from G. Bernard Shaw, C. K. Shorter, and others. The 'Mainly About People' column was a novelty which 'caught on' immediately. Some years later Mr H. W. Massingham took the helm. Next Mr Ernest A. Parke became editor, and remains in that post to-day, having seen most of the editorships of our London daily press change in the meantime. I shall never forget a circumstance in connection with the first evening the *Star* appeared. I had gone to hear Mr Justin McCarthy, M.P., lecture on 'Parliamentary Oratory.' The lecturer was delayed for an hour in his arrival, owing to a mistake as to the hall; but such was the interest taken in the *Star*—almost every one in that audience reading the first number—that no impatience was shown, and it seemed quite natural to sit waiting an hour for Mr McCarthy! By the way, the *Star* is one of the few newspapers which print each day the date of their foundation—in its case January 17, 1888.

The first number of the *Daily Mail* was on sale on May 4, 1896. The paper created a favourable impression immediately. Journalists recognise that it was 'right from the very beginning;' there was not a sign of the usual errors in form, type, or style which one expects in a new paper. The machines could turn out two hundred thousand copies in an hour—a rate much exceeded nowadays. For a halfpenny such a paper was phenomenal.

It was eight years after the foundation of the *Daily Mail* that the *Daily News* and *Daily Chronicle* came down to a halfpenny. In the case of the *Chronicle* the change was a rapid response to the challenge of the *Daily News*, which had been preparing for some months for an alteration. At first the *Chronicle* had only one column of news on the first page, giving the rest of the page to advertisements, but later on it gave the whole front to news.

One of the saddest failures to establish a new journal was Mr Stead's *Daily Paper* in 1904. It only lasted thirty-two days. Mr Stead's health broke down almost as soon as he had started the paper. His touching farewell in the last issue was enough to melt any heart, for it was full of brave acquiescence in defeat. What changes would have saved the *Daily Paper* I do not pretend to say. I think Mr Stead did not take sufficient time to prepare his plans. His experience on an evening paper did not show him the far harder conditions of running a morning paper. The problem of distributing the paper was never solved, and another mistake was the price. The public will not go back to a penny paper after getting such splendid halfpenny papers as they get to-day. Perhaps the price had something to do with the later failure of the *Tribune*, on which Mr Franklin Thomasson dropped many thousands in 1906.

The *Daily Mirror* started on November 2, 1903, first as a women's newspaper at a penny. The editors were, I believe, Mr Sutton and Mrs Howarth. In appearance it was rather like the ill-fated *Daily Courier*, which began its course in April 1896, but expired for want of support. The *Daily Mirror* was changed astutely into a halfpenny pictorial paper, with the result that success came rapidly, and its circulation rose to hundreds of thousands.

The *Daily Express* first appeared on April 24, 1900, and had a message of good wishes from the Kaiser. Tariff Reform may be said to have been the tide which, taken at the flood, led Mr C. Arthur Pearson's paper on to fortune. At all events, it was as the uncompromising advocate of Mr Chamberlain's views that the *Express* rose into its highest circulation. From the first number it was well put together, aiming deliberately at the 'man in the street.'

A real curiosity in my collection is the first number of a London daily paper which only lived four days! This was the *Majority*, a journal which lost no time in joining the majority. It came out on July 10, 1906, and claimed to be 'the first British Labour daily newspaper.' But the class for whom it was intended failed to give it a welcome, and its projectors knew so little of the intricate business of running a newspaper that it perished within a week. Again and again the Trades Union Congress has discussed the question of a special organ, but such a fate as that of the *Majority* may well cause thoughtful men to pause. Working men do not crave to be treated as a separate class.

In 1899 the *Morning Herald* made its first appearance, though it was not entirely new, being a continuation of the *Morning* and the *London Morning*. It was edited by Mr Thomas Meech, and was owned by the same company that controlled the *Echo*. David Christie Murray wrote personal articles for it; but its news department was weak, and it succumbed after a chequered career.

This was the period of the struggle for Sunday editions of daily newspapers. Happily both the *Daily Mail* and the *Daily Telegraph* were induced to withdraw their projects under the pressure of public opinion.

### SOME MONTHLY MAGAZINES.

It is interesting to look at No. 1 of the *Review of Reviews*, dated January 1890. It was a good first number, preceded by autograph letters from Lord Salisbury, Cardinal Manning, Mr Gladstone, and many other great men. The frontispiece is a portrait of Mr H. H. Johnston, British Consul at Mozambique, now Sir Harry H. Johnston, G.C.M.G. It was signed 'A Souvenir in case I get killed

picturesquely in Africa.' The type was less attractive than it is in the present *Review;* but, as with other work of Mr Stead, there were many original ideas which have since become hackneyed by imitation. One cannot help realising how clever the notion of the magazine was in giving extracts from all the leading journals. One realises also what a galaxy of talent was then at the disposal of editors, when Gladstone, Huxley, Dr Magee, Stopford Brooke, Thomas Hardy, and Oliver Wendell Holmes were writing in the same month for the reviews.

The *Rapid Review*, issued first in February 1904, was a palpable imitation of Mr Stead's *Review*. My experience has been that most imitations in journalism fail. It was nevertheless a clever production, printed on good paper. Its portraits and succinct biographies were a popular feature. Though only five years have passed, the progress made in motoring is proved by the fact that the cheap motor was called 'a tantalising and elusive vehicle.' One of the books reviewed was Henry Harland's novel *My Friend Prospero*. Literature suffered a heavy loss by Harland's death. The *Rapid* lasted three or four years, changing in the end its scheme of contents.

No. 1 of the *World's Work* was a beautiful production. One of the best articles was on 'Garden Cities in Theory and Practice.' The full-page portraits—a feature of the magazine—included fine new photographs of Mr Balfour, Sir Henry Campbell-Bannerman, Canon Hensley Henson, and Mr J. M. Barrie. The *World's Work* has sustained fully the high reputation with which it started.

The *Butterfly* appeared first in March 1899, full of brilliant work printed in attractive form. It is sad to read once more the opening poem by H. D. Lowry, a man who seemed at one time to be secure of fame. Arthur Morrison, Adrian Ross, and Walter Emanuel were other contributors, as well as Alfred Slade, who was at the end of his pathetic career connected with the theatrical tours of eminent French actors. The black-and-white work by Maurice Greiffenhagen, J. W. T. Manuel, S. H. Sime, Joseph Pennell, and L. Raven-Hill was enough to give distinction to the magazine. No. 1 had an audacious cartoon by Max Beerbohm of the present Prince of Wales.

No. 1 of the *Girl's Realm* was issued by Messrs Hutchinson, who had made a success with the *Lady's Realm*. One of the rare short stories which the late Rosa Nouchette Carey wrote was in this first number. Mary E. Mann, who never writes badly, contributed a story, and so did Mr Crockett. One of the articles deals with 'The Girlhood of Lady Butler,' written, under a pseudonym, by Mr Wilfred Meynell. The frontispiece was a charming photo of the daughters of the Duke of Connaught. The *Girl's Realm* is edited by Mr S. H. Leeder, and is now published by Messrs Cassell. It has organised excellent charitable work.

More than ten years have passed since *Sandow's Magazine* first started its career. One of its best periods was under the editorship of Mr Howard H. Spicer, who enlisted the help of many well-known contributors.

A threepenny religious magazine was the *Christian Realm*, which had some good contents, but failed to gain sufficient support. In No. 1 I see stories by Katharine Tynan, F. M. White, W. Pett Ridge, Ethel Heddle, and Lillias C. Davidson. A bright article by the Rev. W. C. Chisholm dealt with the Kaiser as a religious force. His motto is 'to live resolutely a complete, good, and beautiful life.' There is no date to be found on this magazine, but I think it was first published about 1902.

There is very little difference between the first issue of the *Treasury*, dated October 1902, and a current copy of that successful magazine. It has been edited capitally by the Rev. Anthony C. Deane, who only resigned last September. He is 'a fellow of infinite jest,' as becomes a contributor to *Punch*. In No. 1 of the *Treasury* are reminiscences of Mr Gladstone by his relative the Dean of Lincoln. A touching incident related to Mr Nettleship's operation on Mr Gladstone's eye. 'Something for the time had gone wrong, and sight was not restored. The eminent oculist who had operated left the room to break the bad news to Mrs Gladstone. When she came to her husband he only said, 'Oh, my dear, I am so sorry for Mr Nettleship.' Poor young Fletcher Robinson, whose untimely death we mourned, wrote a sparkling account of 'A Day of my Life.' The *Treasury* has had a definite aim, and has pursued it steadily.

One of the magazines in my collection is No. 1 of the *Cornish Magazine*. It had the honour of being edited by 'Q,' and had an article by A. H. Norway (whose book on Cornwall is so admirable), a story by 'Q,' a sketch of Madame Fanny Moody's career, a sonnet by A. C. Benson, and a story by Charles Lee, whose careful work I always enjoy. Magazines of local or county interest have only a limited area and do not often become financial successes.

*Chapman's Magazine* began in May 1895, with Mr Oswald Crawfurd as editor. The serial was by Violet Hunt, and the magazine was 'all fiction,' except a long poem by poor John Davidson. But Messrs Chapman & Hall found the venture not profitable enough to continue.

The *Captain* made a bold challenge to existing boys' magazines when it appeared in April 1899. Ascott R. Hope wrote a serial for it in his customary style, and R. S. Warren Bell, a giant among London journalists, wrote 'The Storming of Greyhouse.' C. B. Fry gave hints on athletic training, and there was a racy interview with G. A. Henty, prince of schoolboys' favourites. 'I was a very weakly youngster; they did not expect me ever to see "man's estate" at all. Until I was fourteen I was practically a confirmed invalid,' said Mr Henty. When I recall his burly, nautical form at the Savage Club it seems an encouragement to invalid boys to think that Mr Henty outgrew his early

delicacy. The *Captain* goes on its way, delighting thousands of boys, and little changed since it began over ten years ago.

The *Royal* dates back to November 1898. It was a daring venture at threepence a month to bid for success among the popular magazines sold at sixpence. It did not trouble about 'big names,' for only A. W. Marchmont and Archibald Marshall are well known in the first list of contents. Photography took the place of artists' black-and-white work for the most part.

Miss Ella Hepworth Dixon edited the *Englishwoman*, an illustrated monthly magazine which was first issued in March 1895. She had a good list of contributors. Miss Violet Hunt (then rising into popularity) wrote a story for the first issue, Marie Belloc discoursed on Pierre Loti, L. F. Austin discussed plays, and women's affairs were in the hands of Mrs Aria, Mrs Humphry, and others. Linley Sambourne drew a charming design for the yellow cover.

The *Charing Cross Magazine* claimed in 1900 to be 'the largest threepennyworth ever offered.' It could not compare with other magazines, and most of the contributors seemed to be amateurs. In the same month the *Sunday Strand* appeared, and is still a widely read monthly magazine. A new 'Life of Christ' by Ian Maclaren was its chief feature. I think the title was a mistake, for the *Strand Magazine* had made a special position for itself, and a Sunday reflection of the *Strand* was really impossible. In the first number there was one of Harry How's inimitable interviews. What excellent work he did in his prime! Sir Walter Besant wrote a story for the *Sunday Strand*, and an article on Mr Chamberlain as a Sunday-school teacher attracted attention.

'The most original magazine in the world' was the claim made by the *Grand Magazine* when it started its career in February 1905. It had one hundred and seventy-six pages, no illustrations, and an astute mixture of fiction, fact, and gossip. The first story was 'A Straggler of '15,' which Sir Arthur Conan Doyle said he considered was his best short story. George Bernard Shaw discussed 'The Theatre of the Future,' and John Oliver Hobbes the question as to whether men or women had 'the best time.' The *Grand* still continues in the world of magazines.

Apparently the musical public is very difficult to capture. I have known several failures in musical monthly and weekly journals. Here is the first number of the *Strand Musical Magazine*, issued by Messrs Newnes. Its editor was Mr E. Hatzfeld, and it had some capital matter, musical and literary, and a clever cartoon by 'F. C. G.' The magazine reached a sale of one hundred and fifty thousand and more, but ultimately dropped.

Who remembers that Mr E. F. Benson, author of *Dodo*, was once an editor? He held the reins of an ambitious shilling monthly, the *Imperial and Colonial Magazine*, published by Hurst and Blackett. It made a brave start with a poem by A. C. Benson and articles by Sir Geo. Birdwood, Sir Charles Dilke, Sir John A. Cockburn, and others, but ultimately came to grief.

Mr Harry Furniss started *Fair Game* as a sixpenny monthly in 1898. It had plenty of the artist's clever work, including an enormous cartoon. Mr Furniss enlisted several well-known writers and artists in this, as in more that one bold venture he has made. But the British demand for humour is strictly limited, and Parliament and politics apparently do not appeal to a very large section of the community as themes for cartoons. *Lika Joko* was another amusing paper maintained with great spirit by Mr Harry Furniss.

Sport has tempted many an editor, as my collection of magazines proves. Here is the *Badminton Magazine*, started by Longmans, Green, and Co. in 1895, under the editorship of Mr A. E. T. Watson. It is a capital first number, with lively articles by experts, and first-rate illustrations. Mr C. B. Fry wrote on 'Hard Wickets.' He says: 'Cricketers are rarely much interested in anything except the great game they play,' and I think he is right. Cricket seems to absorb a man's whole attention.

In 1895 a sixpenny monthly magazine called the *Country House* made its first appearance. It had eminent contributors, like the Earl of Winchilsea, Sir J. B. Lawes, Rev. S. Baring-Gould, and that evasive personality 'A Son of the Marshes.' I notice a short article by the late Sir R. H. Paget, father of Mrs Herbert Gladstone, who 'bid God-speed to all reasonable proposals for secondary education, old-age pensions, or any reasonable schemes of social progress.'

*Our Young Men* was a venture of Messrs S. W. Partridge in 1902. Mr J. A. Hammerton pervaded the little monthly magazine with his versatility. But after six years it was given up.

A very good beginning was made with the *Minster*, a sixpenny monthly magazine published by the now defunct firm of A. D. Innes & Co. I believe it was edited by the wife of the Rev. Montague Fowler, who has written plays and novels under the pseudonym of Dayrell Trelawny. This accounted for a contribution from the Archbishop of Canterbury, whose chaplain Mr Fowler was, and for a lively sketch of Bishopthorpe, the home of the Archbishops of York. Dr Maclagan tried to drop 'Palace' from his address, and had his notepaper stamped 'Bishopthorpe, York.' A visitor admitted a liking for the grander address. 'Why?' asked the Archbishop. 'Driven into a corner, I confessed somewhat feebly that "I thought it imposing."' 'That is just why I dislike it,' replied Dr Maclagan, who always hated ostentation. The *Minster* ought to have succeeded; where it failed, the *Treasury* captured a considerable clientèle later on.

I go back to June 1889 for the first number of the *New Review*, which was edited by Mr Archibald

Grove, afterwards a Liberal M.P. It ran until 1897, with various changes of form and policy, and its last editor, I think, was W. E. Henley. The first articles concerned General Boulanger, the French pretender who was then fluttering France. Mrs Lynn Linton the inevitable, Lord Charles Beresford on 'National Muscle,' the present Marquis of Northampton on 'Homes of the People,' and Lady Randolph Churchill on 'A Month in Russia' —these were the chief features of No. 1. It was a good magazine, but aimed too much at *Nineteenth Century* articles instead of more sprightly matter by less eminent writers.

It was in 1898 that Messrs Newnes started the *Wide World Magazine*, which continues to this day. The too marvellous tales of one Louis de Rougemont made it notorious. It has since settled into a steady-going magazine, with travel-tales and adventures.

### WEEKLY ILLUSTRATED 'SIXPENNIES.'

I suppose two of the most successful illustrated papers started within the last twenty years have been the *Sketch* and *Country Life*. The former emanated from the office of the *Illustrated London News* in 1892, and by its original use of photography and its lively literary contents secured a great sale from the very first number. Mr Clement K. Shorter introduced, through the pages of the *Sketch*, very many writers who have since come to fame. The paper was full of intentional contrasts—a Bishop's portrait faced the latest photograph of a dancer; the 'Literary Lounger' column was not far from Racing Notes. Each week when Parliament was sitting the Liberal viewpoint was stated by H. W. Massingham, and the adjoining column gave the Tory opinions of Mr Sidney Low. The 'Novel in a Nutshell' gave some brilliant examples of the short story at its best, by such writers as Frederick Wedmore, Mrs Andrew Dean (now so popular as Mrs A. D. Sidgwick), Flora Annie Steel, and others. The *Sketch* led the way in exploiting the theatre to its utmost, and since then many weekly papers have essayed to rival its success.

*Country Life*, started in 1897, has made for itself a unique position by the beauty of its illustrations and its devotion to outdoor life. It was from the first bold in its use of superb paper, which gave it a handsome appearance and attracted a fine array of advertisements.

Another splendid first number which has maintained fully its early promise is that of the *Sphere*. Mr Clement K. Shorter saw an opening for an illustrated weekly paper of the highest type, and grudged no expenditure to gain for the *Sphere* a European reputation. His own 'Literary Letter' has been a very popular feature of the contents. Foreign events and exploration have been specially illustrated. The Boer war and the revolutionary events in Russia were 'covered' with brilliant success.

*St Paul's*. Do you remember the sixpenny illustrated weekly paper of that name? It began in March 1894, and ran for quite a long time. It had engravings which look to-day singularly rich. Its contents were a medley—gossip of the churches close to gossip of the stage.

It was in July 1901 that the *Tatler* made its beginning as yet another sixpenny illustrated weekly. How this field of journalism has been enlarged since the days when the *Illustrated London News* was the pioneer! The *Tatler* had the advantage of the experienced skill of Mr C. K. Shorter (editor of the *Sphere*) and Mr J. M. Bulloch (now editor of the *Graphic*). It was printed beautifully, and was full of readable matter and charming illustrations.

The first issue of the *Ladies' Field* is before me. It is very handsome, and at once secured good support from the advertisers.

It is about eleven years since *Lords and Commons* appeared as an illustrated parliamentary paper at sixpence weekly. The editor was Mr F. Moir Bussy. Politicians are not numerous enough, I fear, to support a paper which does not appeal to the general public; so, despite articles by Tim Healy, K.C., M.P., Sir Horace Plunkett, and others, the venture came to an end.

Mr Frank Harris brought out the *Candid Friend* in 1901, as a sixpenny weekly paper. It had, as one of its features in No. 1, an autobiography by A. G. Hales, then much in the public eye as a war-correspondent. It ended: 'I don't think much of missionaries, politicians, soldiers, authors, or actors. The best fellows I have ever met are hard-up, hard-working, gritty newspaper-fellows. The worst are successful writers suffering from "swelled head."' The *Candid Friend* did not succeed in gaining a standing ground, despite its lively contributors.

*(To be concluded.)*

## SPRING'S WELCOME.

The golden harp of Spring is singing clear
Within the woods, through willows bending low;
Along the sea-dunes, or by lonely mere,
Her rhapsodies with sweetest music flow.

The bursting buds, the wakening earth, the sky
Welcome her coming and her halcyon hours;
And Hope on rosy-bosomed clouds flies high,
And Love awakes again with fragrant flowers.

The denizens of copse and hedgerows rude,
The birds, the flaunting butterflies, and bees
Join in their chorus, and in recreant mood
The warm sap rises in the love-lorn trees.

Welcome to thee, then, sweetest maiden Spring,
With arms outstretched we now awaiting stand;
And may thy music o'er creation ring
With notes of peace and plenty to the land.

# A LITTLE MORE ABOUT DIGESTION.

By the Right Honourable ROBERT FARQUHARSON, M.D.

YOU have not said the last word about digestion; nor indeed is such a thing possible. We might as well try to explain why one man or woman has a Roman nose, or why the corresponding organ of another is 'tip-tilted' like a flower, as to dogmatise on the reason why my stomach is able to tackle the gigantic banquets of modern society, and why yours is weak and squeamish, and must be carefully nursed; why what is one man's meat is another man's poison. Argue as we like, dogmatise as we please, experiment up to the extinction of the canine race, no fellow can ever understand the mysteries and vagaries of idiosyncrasy; and when that strange perquisite of human nature goes hand in hand with heredity, in which, despite the microbe-mongers, I still believe, then physiologists and physicians alike must admit that there is something still to be learnt about man, that proper study of mankind.

I have the highest belief in the experimental method conducted on strictly scientific lines, and with a definite object; but no one will persuade me that if we establish a fistula in a dog's stomach and introduce a selected food to test the digestive processes, there can be any real analogy with what takes place in the gastric economy of our noble selves.

This is not a medical paper, and I ask pardon if I advertently make your flesh creep by horrifying descriptions of what goes on in our insides after a hearty meal. A very crude method was once adopted by an advocate of the simple life, who ordered some one who was enjoying a good dinner to place in a vessel standing by his side a portion of everything he had eaten and drunk, and the horrors to eye and nose of the resulting mixture were supposed to make the victim have pause before he again embarked on such a perilous combination of good things.

On far more practical lines were conducted the observations of Dr Beaumont on Alexis St Martin, a Canadian, who had been left after a gun-shot accident with a large and permanent hole in his stomach, enabling the shrewd American doctor to make and record a number of most interesting and important observations, which form the only real bit of absolutely dependable knowledge we possess about the behaviour of that all-essential organ under a great variety of circumstances.

The young man was taken into Dr Beaumont's service, and readily lent himself to experiment; and as he remained in robust health all the time, we may safely take the results as fairly indicative of how our stomachs dispose of a great number of dietetic materials, making allowance for probable variations due to the personal equation.

*Dr Beaumont's Experiments on Digestion* were introduced to the British public by the late Dr Andrew Combe of Edinburgh, a man of unusual clinical tact and sagacity, and a pioneer in physiology, sanitation, and the upbringing of children, whose premature death deprived the profession of one of its brightest ornaments. My father attended this truly great man in his lingering illness up to his death from consumption, and I have just discovered and read the presentation copy of his book given or left to his medical attendant.

Some of the experiments read rather quaintly. For instance, one day, when the minister of the interior announced a healthy appetite, twelve oysters were placed in St Martin's stomach through the artificial opening. Two hours later they were taken out and the operation of the gastric juice carefully noted; and a long series of observations were made in this way on the relative digestibility of various articles of diet. Tripe, we note, stands out an easy first, with beef much lower down on the scale; whilst cheese, which is said to digest everything except itself, retains its bad eminence at the bottom of the list.

Without entering into details, some general propositions may be laid down, derived from experience as well as from Dr Beaumont's epoch-making work, which stands as firmly as it did when it was first placed before the scientific world, over seventy years ago.

[*All Rights Reserved.*]

(1) Dyspeptics bear fluids badly. A dry diet is usually needed for them.

(2) Due mastication is essential, as reducing the food by trituration to that state of fine division necessary to bring it into effective contact with the gastric juice. It will be remembered what great importance Gladstone attached to chewing his food, and I am almost afraid to say how often the morsel was churned between his teeth before it was allowed to slip down his gullet.

(3) Dr Beaumont shows 'bulk to be as necessary for healthy digestion as the presence of the nutritive principle itself.' 'This, in fact, is felt almost instinctively, as was amazingly shown in the reply of the spokesman of a party of the Veddahs or wild hunters of Ceylon to my friend Mr H. Marshall when the latter inquired why his people always mixed the pounded fibres of soft and decayed wood with the honey on which they fed when meat was not to be had. "I cannot tell you," said the practical Veddah; "but I know that the belly must be filled"' (Note by Dr Combe). And in this connection I may note a very wise remark made by the late Sir William Broadbent to an old medical friend of mine and his who was suffering from an acute form of dyspepsia, and whose life was undoubtedly saved by the suggestion of that wise and experienced physician, that his stomach should be washed out two or three times a day by means of a siphon-tube. 'You are not,' he said, 'giving your stomach enough to do.'

(4) Gentle motion is of great use, as helping the peristaltic movements which are necessary to mix the food with the gastric juice and help the formation of the chyme, which, being then boiled down into chyle, forms the basis of healthy nutrition. I remember once dining in the House of Commons with the late Sir David Wedderburn, whose quaint and ingenious mind was only equalled by his political sagacity, and we were three times called away from dinner by the inexorable claims of the division-bell. I, as a new member, was disposed to grumble at this; but my more experienced colleague said he liked it, and that it did him good; and although he had no explanation to offer, there is no doubt that he had, without knowing why, hit upon a profound physiological truth.

(5) Food should always be taken in cheerful society, and ought to be as varied as purse as well as inclination will permit. The solitary bachelor or the 'causeway saint but the house deil' who props the *Times* or the *Scotsman* in front of him while he devours his meal pays for his mental exclusiveness by Carlyle-like dyspepsia, whilst the family man and popular singleton who irradiate beams of happiness and good fellowship around them go through their day's work with comfort to themselves and satisfaction to others. Thank goodness, the cut from the joint and the tough steak or chop are now giving way to more sensible cooking, and those who preside over our kitchen-fires are being told plainly that they must learn their own business, and that the once despised kickshaws are really more wholesome even than the roast-beef of Old England.

(6) Experience as well as common-sense tells us that we must restrict our dietary a little as we grow older. We are no longer building tissue; we are not even destroying it as rapidly as of yore, and any excess of nourishment over our structural requirements only gives rise to accumulation of effete material and invites the insidious approach of gout and rheumatism and other disorders which dog the declining footsteps of the old. Here I must refer my readers to the writings of the sage old physician, the—I regret to say—late Dr George Keith.*

(7) I am almost afraid to touch the thorny subject of alcohol. I have pricked my fingers before now, but don't feel much the worse for it; and I stand, and don't intend to fall, by the article which by the favour of the editor I was privileged to publish in the honoured and widely read pages of 'Maga' some years ago, 'A Plea for Moderate Drinking.' I still agree, as I agreed then, with a wise saying in the Bible, 'Take a little wine for thy stomach's sake,' the experiments having shown that moderate doses of alcohol improve, and do not impair, the digestive process. But it must be carefully regulated, taken at proper fixed times, and with due regard to moderation. Never drink between meals, save under the following circumstances. When you come in chilled and perhaps wet from a depressing walk on a bad day, a little nip of pure whisky will whip up your circulation, replace the goose-skin of your cutaneous envelope by a healthy glow, and often prevent that sudden rush of blood towards the internal organs which finds out our weak spot and lays the foundation of disease. And, second, the not uncommon practice, more especially in tropical climates, of taking a glass of sherry-and-bitters or vermouth before sitting down to dinner is purely physiological; for the weakened stomach of its owner, tired out by hard work and exhausted by prolonged fasting, is quite unable to cope with the gigantic meals—happily now somewhat restricted in quantity—of social custom, and strikes more or less effectually against the task imposed on it, and the timely stimulant gives it tone, promotes the secretion of gastric juice, and enables it to do its duty in that state of life to which it has been called.

To sum up this part of the subject, let me recall the words of Sir James Paget, one of the wisest heads ever placed on medical shoulders, who said or wrote, 'I thank God for good food and good drink.' Now let me sum up generally. The conclusion to which I have come is that, whilst the stomach, sympathetically and sensibly treated, will be a good friend, if you allow it to gain the mastery it may become a relentless tyrant. Some one once wrote these true words: 'Brisk confidence still best with woman copes,' and the same remark applies to the hollow viscus whose success or failure in dealing

* *Plea for a Simpler Life* and *The Fads of an Old Physician.*

with the difficult work imposed on it has made or marred many a promising career. So 'take no care for the morrow;' but, save under definite physical conditions when a specifically regulated regimen is necessarily imposed by your doctor, eat and drink exactly what you please, and pay no attention to the fads and fancies of the dreary army of cranks who try to fill up their vacant lives by endeavouring to shove their mental or physical nostrums down the throats of their often unwilling victims; and don't, as a rule, take the advice even of fully qualified medical men about your diet. They usually prescribe what happens to suit themselves; and, as every man is supposed to be a fool or a physician after forty, you must surely have found out by that time what agrees with you. Some people prefer to be vegetarians, and we have all seen and admired very complete all-round vigour maintained by 'a dinner of herbs, with contentment withal.' Most of us, however, prefer the more succulent and satisfying flesh-meats, skilfully and variously cooked, and a due admixture of both sorts of ingredients undoubtedly holds the field. Above all, don't think too much about your food or your digestion, or fancy that you can't safely consume this or that; and never take the advice of old women of either sex as to what you should eat, drink, or avoid. You can upset any organ by thinking constantly about it, as shrewd old Sir Henry Holland pointed out in his sensible and suggestive essay on the influence of expectant attention on the bodily functions. So take an independent line, steer clear of tradition, chew and swallow what seems to agree with you best, and you will be rewarded by the success of a prescription which will make you both 'healthy, happy, and wise.'

# LAURISTONS.

### CHAPTER XXX.—HOW THE MARQUIS TALKED WITH THE TIGER.

MONSIEUR DE MONTESSONNE'S reception by the First Consul was all that he could have desired, unless, indeed, it had permitted the substitution of his legitimate sovereign for the First Consul himself. But Bonaparte's star was blazing to its highest, and the feeble constellations of the Bourbons seemed sunk below the horizon for ever.

The old Royalist had been not a little disturbed at thought of the necessity of meeting this man of the people, before whom the whole world seemed ready to prostrate itself more or less. But there was no help for it. It was part of the price of his rehabilitation, and the return was without doubt of the most solid. The interview left him more thoughtful than ever, and no one ever heard him say a word against General Bonaparte.

He found the First Consul in the little cabinet with the arched window, where the seeds of so many mighty projects were sown. In the middle of the room was a great table covered with papers; at a smaller table near the window, as the marquis was ushered in by Talleyrand himself, a secretary was still writing furiously his chief's last words. Rolls of maps stood in the corners. Evidences abounded on all sides of strenuous, hard work.

Bonaparte stood by the fireplace with one arm on the mantelpiece and one heel on the fender. He looked up with the thread of his thought still in his keen gray eyes, as though he had in his absorption forgotten already that he had given leave for the interview not five minutes before.

'Ah, Citizen Talleyrand?' he said, with a frown.

'Citizen Consul,' said Talleyrand, 'with your permission I present to you M. de Montessonne.'

'You are welcome, Citizen Montessonne. You are desirous, I am told, of living at home again.'

'To a Frenchman, Citizen Consul,' said the marquis, with the De Montessonne bow, 'life anywhere save in France is exile.'

'But you have fared well abroad.'

'I worked hard for my living till happier times came.'

'Ah, you worked! At what?'

'Driving the only perfect language into the heads of English boys, Citizen Consul—the hardest work I ever encountered.'

'*Ma foi!* yes. The easiest way to put things into English heads is to split them open. You have met Fox—Pitt—Burke?'

'I had the honour of meeting most of the men of note over there.'

'The Prince?'

The marquis bowed.

'He is *bon garçon*, is he not?'

'He has his weaknesses, like other men, Citizen Consul.'

'Where did you think of living?'

'With permission, among my own people, at Mortaigne, in the department of the Yonne.'

'You have a house here also?'

'I had, Citizen Consul.'

'For the present you will reside in your own house in Paris, Citizen Montessonne,' said Bonaparte, drawing out his snuff-box. 'The rest will follow. We—I may require more of you before long.'

He snuffed thoughtfully, then offered the box to the marquis, who helped himself in his grandest De Montessonne manner, which cast the First Consul's much into the shade, but yet seemed to meet with his approval.

'I have but one desire, Citizen Consul,' said the marquis, 'and that is to pass the short remainder of my days in peace among my own people.'

'We are all young nowadays, citizen, and the

country desires peace.' And the marquis, who prided himself somewhat on his experience of men, could make nothing of the inscrutable gray eyes which still rested upon him in thoughtful approval.

Then, with a sharp snap of the snuff-box lid and a brief nod of dismissal, Bonaparte came out of his day-dream and turned to his secretary.

'Where were we, Bourrienne?' And they bowed themselves out.

'Well?' asked Talleyrand, with a smile, when they were in the court outside.

'He is a man,' said the marquis thoughtfully.

'Undoubtedly; though some across there hold him to be the devil.'

'What can he possibly want with me? My days are over.'

'The Marquis de Montessonne was one of the shining pillars of the Court—before the deluge. Why should he not grace a Court again?'

The marquis stopped and looked at him with raised eyebrows. Talleyrand nodded with his knowing smile.

'So!' said the marquis, and walked on more thoughtfully than ever.

---

### CHAPTER XXXI.—HOW THEY DECIDED JOYOUSLY TO GO INTO THE TIGER'S CAGE.

NOT until his preparations were fully completed would the marquis consent to his wife's joining him in Paris. She waited in London impatiently, eager to taste at the earliest moment the cup for which her lips had thirsted so long; and those restless transition days seemed to her as though they would never come to an end. Now, at last, her loftiest dreams were to be realised. She was to be a Marquise of France in fact as well as in name. Her deportment showed it.

Mistress Honeybun's showed it no less. Jerry MacClootie did his best to prick her rainbow bubble with sharp, dark hints that her head would be loose on her shoulders from the moment she set foot in France. But she was proof against all attacks. As the confidential woman of a Marquise of France she could afford to look down with uttermost contempt on the virulence of a mere baronet's coachman; and as for the coachman's wife——

But Hepsy's mind was too full of her own mistress to be troubled by any outside concerns whatever. Lady Lauriston's sweet face still wore to the world the brave mask of her indomitable will. But the cost was telling on her. None but Hepsy MacClootie knew what she suffered at times, and from her the meaning of it was hidden; and even to Hepsy was only permitted such knowledge as no amount of stoical endurance could hide entirely from the keen insight of a whole-hearted devotion. She only knew that for reasons of her own, which must therefore be good and all-sufficient ones, her dearly loved mistress was wearing herself out in the assumption and assertion of bodily powers which were not really in her. It was a perpetual marvel to Hepsy that so frail a body could still keep up any appearance of strength whatever, and she lived in constant fear of a collapse and a sudden and final ending.

But to all her pleadings her mistress turned, not a deaf, but a steadily unresponsive ear. For Mary Lauriston's fears for her husband had grown—the grimmest of all fears—the fear of the unknown. What dreadful thing it was that threatened him she did not know. Only that it was something so terrible that often of a night his weary brain could not suffer it in silence, and that by day he too wore a mask of gentlest consideration and quietest courtesy to all. Oh, if he would only tell her the whole matter and let her share the burden! That he did not, confirmed and heightened all her fears. But if he did not it was because he could not, and at all events his burden should not be the heavier for concern about herself. And so she wore her strength to a shell, and spent herself in agonies of prayer for him, and drew therefrom unconscious stores for her own sustenance.

And he! How could he disclose to her this dreadful thing? It was a man's burden of sin and shame, to be hidden at any cost from those he loved. And so he struggled on under it, suffering, with a quiet and even a smiling face, tortures of self-reproach and unending agonies of fear lest all his strivings should but drag his loved ones into the pit with him after all. Oh, beyond a doubt this man's path, broad and fair and prosperous to the world, was paved with suffering and hedged with thorns, and he trod it with bleeding feet.

Mavie Lauriston at fifteen was as charming and delightful a bit of human nature as one could conceive of. Her face was not perhaps so regular in its features as her mother's, but it was instinct always with the vivid joy of life, and every single feature in it was good. Her eyes were large and eloquent; her mouth perhaps a trifle wide for true classic proportions, but altogether bewitching in its ready smiles and laughter. She was always all alive to her finger-tips, and all the joy of it sparkled in her eyes and face. She was keenly interested in everybody and everything. Life to her was a wonderful opening book, and she followed with alert curiosity and quick intelligence every turning page and every mark upon it. She was gifted, too, with her mother's charm of easy and natural manners. Her body had kept pace with her mind. She was tall for her age, slender as yet, and as graceful as a young thing of the forest or the prairie.

Charlie had been gazetted to his father's old regiment, and was spending a year at a military tutor's.

Young John Sax and Etienne de Montessonne were still at Westminster, the former completing a full and honourable, if not in any way a startlingly brilliant course, prior to climbing the stool that awaited him in the bank; and the latter just waiting on until his grandfather's negotiations with the

Government should open the doors of a career to him in his native land.

Aunt Charlotte's excitement at thoughts of her forthcoming transplantation to what she had come to look upon as her natural lofty sphere was damped somewhat by the marquis's quiet insistence that for some time to come—in fact, until, as he put it, their alien feet had grown accustomed to their native soil again—it would be both necessary and becoming to live quietly and without ostentation. She would, if she had had her way, have travelled with six horses and a gilded coach, and let all the world on both sides of the Channel know, without possibility of mistake, that the De Montessonnes were coming to their own again.

But '*Doucement! doucement, mon enfant!*' was the marquis's constant precept—murmured, it is true, but none the less inflexible. 'All in good time you shall have all your heart's desire; but it would be neither politic nor seemly to go back in the guise of conquerors when we are in reality but returning fugitives.'

It was under the sum of all these circumstances that the marquis suggested that Sir Charles might find it profitable to make a short visit to Paris for the sake of personally viewing the condition of affairs there; that, if he knew anything about such things, Miss Mavie would give her eyes to accompany him; and that they might all go across together. And Mavie's eyes indeed bore eloquent testimony to the truth of his observation.

The idea commended itself to Sir Charles. Half the world, and the other half's wives and daughters, were flitting across and bringing back wonderful and garbled reports of the new order of things.

'In even a fortnight,' said the marquis, 'if you could spare that time from the helm, you could form your own opinion of men and matters; and an hour with M. de Talleyrand will tell you more about the possibilities of the future than you could learn on this side in five years. He is not one to put his inmost thoughts on paper, as you know.'

Sir Charles nodded thoughtfully. Mavie watched him with sparkling face and eager eyes.

Lady Lauriston, without seeming to do so, quietly observed them both and what was in them, and schooled herself to their going. 'You would like to go, Mavie?' she asked with a smile that showed her own knowledge of the futility of such a question.

'Oh mother!'—and the slim hands clasped ecstatically—'to see Paris! and General Bonaparte!' For Bonaparte was not as yet by any means the bogy he came to be later on.

'There is no danger in their going, M. le Marquis?'

'Not the slightest, my dear madame, or I would never have proposed it. For months past there has been mighty traffic between Paris and London; and the English are well received over there, curious specimens though some of them are,' said the marquis with a reminiscent pinch of snuff. 'And that reminds me, I must put this away;' and he looked regretfully at his favourite snuff-box, which bore inside the lid a very fine miniature of Marie Antoinette. 'I was on the point of returning a courtesy of the First Consul's one day, when I remembered, just in time, that its decoration might not be acceptable to him. On so small a thing may one's fortunes hang when one man holds all the power in his own hands. He would probably have deemed it intentional, and ordered me out of the country.'

'It sounds somewhat like venturing into a tiger's cage,' said Lady Lauriston apprehensively. 'The door, however, is always open should the tiger show his claws.—And you are sure you would not find her a trouble, Charlotte?'

'Oh, my dear, not in the slightest! It will do her good to see the world. She has learnt more at school than ever I did, I am sure. And one never knows, she might not get so good a chance again. Though, when we are quite settled over there, it would please me greatly to have Mavie come and stay with me for as long as she could.'

And so it was settled, and they little knew into what they were so lightly adventuring.

*(To be continued).*

---

# SHIFTS FOR A LIVING.

By the Honourable GLADYS GRAHAM MURRAY.

N studying the world of animal life we are at once struck with the many and diverse tricks which the various species exhibit in order to foil their prey and escape with their lives in the great struggle for existence.

Foremost among these 'shifts for a living' is that of protective colouring, though one can hardly say that an animal practises protective colouring. Take, for instance, the partridge: see how the shades of gray and ruddy brown of its plumage harmonise with the tints of its environment, and consequently how difficult it is to notice that bird when it is squatting.

During the summer of last year I was very interested in watching the baby sandpipers on the banks of the Tay. There were several broods; one in particular I kept under constant observation through my binoculars. The little chicks were soon taught to crouch or skulk at the first sign of danger, and thus make themselves almost entirely invisible. If one took one's eye off them for a few seconds it was almost impossible (so long as they remained in their crouching posture) to rediscover them, so

strong was the protective value of the colouring of their down.

The same protective colouration is very marked in the case of the ringed plover's eggs, which are generally laid on the bare shingle of some river-side or beach. One may step on the eggs before actually seeing them.

In India we find that the stripes of the tiger harmonise admirably with the lights and shades of the jungles and thickets, and that instead of their colouring rendering these animals conspicuous it makes them almost invisible—at least to the human eye. The giraffe, again, might strike one as being very conspicuous; but hunters and naturalists tell us exactly the contrary—the various shades of the different patches or marks on the body breaking up the light, thus rendering these quadrupeds almost invisible.

There is in the central hall of the History Section of the British Museum at South Kensington a most interesting case of stuffed Arctic animals, showing how in winter their pelts and plumages turn white, thus assuring them of protection. The ptarmigan and the Arctic fox are both, in winter, invisible among their snowy surroundings. In the case of the Arctic fox his snow-white coat enables him to creep up to the ptarmigan on which he means to feed without being noticed, whilst at the same time he escapes the wary eyes of the hungry wolf who may be on the lookout for a meal. This is a case in which protective colouration performs a double duty. In the same museum, side by side with the above, is another case full of specimens of desert-birds, which show the harmony of their plumage with the dull brown of their Libyan surroundings.

An interesting experiment was made by an American naturalist, Mr Thayer, which illustrated the value of light and shade as a protective factor. He hung two wooden birds shaped like woodcocks on thin wire supports, and coloured one of these in a uniform tint, coating it with a little earth. He treated the upper half of the second decoy in the same way, but the lower part he shaded to a pure white. When he looked toward the two, at a distance of about forty to fifty yards, the shaded one was invisible, whilst the one of uniform colour stood out clearly.

Mimicry also plays a most important part as a 'shift for a living,' though in the case of animals the mimicry assumed may be unconscious. The cuckoo unconsciously mimics a hawk in appearance, and is held, no doubt, in greater awe on this account; but it is among insects that we find the most marvellous instances of this quality. The gorgeous colouring of the wings of some of our butterflies is well known, and these are even surpassed in splendour by their foreign relations. Yet when these butterflies alight on the various flowers and turn up their wings, at once the under-side harmonises with the surroundings and the insect becomes inconspicuous. In the wonderful stick-and-leaf insects of Central Africa mimicry reaches its highest point, and the closest scrutiny may often fail to show whether it is an insect or a twig of wood at which one is looking; whilst the leaf-butterfly plays one just the same trick. Other insects imitate mosses or lichens; whilst certain butterflies imitate—if one may say so—their neighbours, and thus pass as members of a family to which they do not really belong; this trick being of great benefit to them, as in many cases it is found that the mimicker adopts the hues and colours of its unpalatable neighbour, which is left alone on account of the nauseous fluids which its body possesses.

Some animals will part with their limbs in order to escape with their lives. For instance, if a lizard is seized by its tail it vanishes, leaving only its tail in one's hand; whilst the starfish thinks nothing of parting with one of its rays so as to escape with its life. The cuttlefish, swimming in the sea, when pursued by an enemy, at once opens its *sac* and squirts out a volume of black liquid (sepia), thus effectually darkening the water and effecting its escape. Many animals when alarmed emit harsh sounds and noises, while some even feign death.

Perhaps it may seem hardly correct to include the different habits and habitats of various birds and animals under the head of 'Shifts for a Living;' but one has to remember that each animal is adapted to its special mode of life. Of course the most important factor in animal life is the procuring of food. It is obvious that the sharp teeth and claws of the flesh-eating animals (the carnivora) would be of no use to grain and vegetable eaters; therefore the flesh-eating animals, such as the lion, are constructed on a different principle from the graminivorous ones, such as the ox. The teeth of these animals are totally distinct, whilst one is provided with hoofs and horns and the other with the sharpest of claws. That splendid creature the reindeer, which is so invaluable to the Laplander (so valuable is it that a Laplander's wealth is reckoned by the number of reindeer which he possesses), has its feet adapted to its special needs. They are deeply cleft, so that when pressed on the ground they spread out, thus preventing their owner from sinking deeply into the snow, and affording at the same time a secure footing on the slippery ice.

The tongue of the giraffe is especially long and slender, and prehensile at the tip, so that it can be coiled round the stem of the leaf on which it feeds, and with its long neck it is able to pluck the leaves of the highest trees, whilst when grazing or drinking it straddles its legs apart. It is interesting to note that the giraffe possesses only the same number of neck-vertebræ as we ourselves have—namely, seven.

The stomach of the camel is especially adapted for life in the arid desert, being composed of three chambers; so that it practically carries a reservoir of water with it, and subsists on the fat of its own hump, which it assimilates on the journey or march, and which actually serves as nourishment; whilst its broad, splay, cushion-like toes do not sink deeply into the sand.

The crocodile, which kills its prey by drowning, is able with perfect safety to keep itself under water with its mouth wide open; for, by the aid of a little valve which is situated at the back of its throat, and which is closed tightly when its mouth opens, water is prevented from passing down the throat.

In the various bills of birds there is the most wonderful adaptation for the mode of life which each species pursues. The soft, long, and flexible bills of the snipe and the woodcock are most admirably suited for the diet of these birds, which consists chiefly of worms. In the beak of both, the tip of the upper mandible is solid; the lower mandible is not quite so long as the upper, and fits into a small notch in the latter. The beak of another water-bird, the spoonbill (long ago resident in Britain), resembles two long, flat spoons, so that the bird dabbles about in the mud. In the duck family the mandibles are flat and broad, and are provided with a straining arrangement, in the shape of a fringe at the sides, by means of which they can sift out the water and mud.

The soft, flexible bills of the thrush family are well suited to a 'wormy' diet; whilst the strong, blunt little beaks of the finches are admirably adapted to one of seeds. In a small European bird, the crossbill, the beak is actually crossed like a pair of scissors, so that the bird gets additional strength for splitting open the fir-cones for the purpose of extracting the seeds.

The sharp and hooked beaks of birds of prey are adapted to their mode of life. A very singular instance of this adaptation is found in the huia-bird of New Zealand, where the male has a short, straight bill with which it chisels away the decaying wood, whilst the female is able to probe for the insects with her long, slender, curved bill. This is truly a case of the division of labour.

The bills of the humming-birds are adapted for piercing the flowers from which they suck up the juices and the tiny flies which are found in them; whilst the long tongue of the woodpecker is provided with a sharp, hard point and several barbs, all of which are covered with a sticky substance, so that with its powerful, axe-like beak it is able to chisel away the decaying wood in the trees and then lick up the grubs and insects. The long tongue of the woodpecker is a most curious and wonderful contrivance, as when it is not in use its long roots extend backwards, forming a loop on each side behind the head, and then curve round over the top of the skull to their seat of origin near the right nostril. When the bird wishes to protrude its tongue this apparatus acts like a coiled spring which is let out with a sudden jerk.

The feet of various birds show the same modification. The ducks have webbed feet, and the birds of prey have large claws, whilst the climbing-birds have their toes arranged so as to ensure a firm grip. The jacana (a native of South America) has the toes and toe-nails much lengthened, enabling the bird to pass over floating aquatic plants which otherwise would not bear its weight.

In studying these few examples of 'shifts for a living' in the animal world we are left with many an unsolved problem. Is it instinct or blind chance which guides and rules the great world of Nature, or does there lie beneath all phenomena the guiding hand of Providence? An American poet answered in part the question when he wrote these lines:

A fiery mist and a planet,
A crystal and a cell;
Then a saurian and a reptile,
And a cave where the cave-men dwell;
Then a sense of law and order,
And a face turned from the clod:
Some call it Evolution,
And others call it God.

# THE PATH OF ST PETER.

PART II.

WAS already searching the unconscious man's clothing for despatches, since at any moment Montmorency's troopers might arrive. A roll of papers was quickly found and opened. It contained minute directions from Coligny, also a plan of the path over the marshes, the secret of which he had learned from a fisherman.

Fortunately for myself, as it afterwards turned out, I took in the details of the map with keen, though hasty, attention. St Peter's Path was no fanciful name, for some portion of the way was actually submerged. It led from the high-road beyond the village of Essigny across a stretch of marsh in the direction of two long pools, one rather in advance of the other, between which it ran for some distance, till, beside a small willow, it plunged straight through the water of the larger pool, passed diagonally to the farther side, where it swerved towards the Faubourg d'Isle, one of the suburbs of the city, and finally wound round the curves of a vast bed of reeds, till it reached sound land once more. Before the night was over I had good reason to be thankful that I had a fair memory for lines and markings.

'Should we be pursued 'twill be the only road to safety,' said Maher over my shoulder. 'Ready? Good! But first let us hide this proof of our real mission,' pointing to Brueuil. 'Those dumb lips could yet betray us. What have we here?' he added, opening a low door almost screened from sight by the heavy settle, which disclosed a recess in the outer wall.

And there we left poor Brueuil with his broken sword across his knees.

Then, scattering ashes over the earthen floor where his body had fallen, Maher bade me make ready the horses.

'Wait at the head of the path by which we came, and it will go hard if we do not give Montmorency the slip.'

I went out, leaving him tying up the plan and other papers, and in a few minutes I was waiting, mounted, under the trees. First, however, I turned Brueuil's horse loose and drove him away into the forest. Wandering and riderless horses were too common in those days to excite suspicion.

I listened for Maher's coming with anxiety. Then, on a sudden, a clatter of voices and harness from the opposite side of the hill told me that an armed cavalcade were mounting to the inn from the main pass. Still Maher did not come. Between the trees I saw four men ride into the inn-yard. They called for attendance, but the innkeeper had apparently betaken himself to quieter quarters, for no one answered.

'They have not yet arrived,' grumbled the officer. 'De Rochefort should have come himself to see to this affair.'

'He is by this time happily drunk at Essigny,' laughed another with a coarse jest.

'Let us enter. We may at least find wherewith to wash the dust from our throats,' suggested a third.

Three of the party dismounted and went into the inn, the fourth remaining in charge of the horses.

A second later Maher slipped out and ran round the yard under shadow of the buildings and entered the wood at the point whence they had emerged, then made towards me through the trees.

The trooper on guard raised an outcry and fired in the direction of the flying shadow. I had scarce time to look back when Maher was in the saddle and urging his horse at breakneck pace down the steep hill-track.

'I'll wager they don't know this path nor the hollow behind the hill. They will follow us by way of the main pass, but we may get ahead of them for all that,' Maher said, when we no longer heard the shouts of our pursuers.

'You managed to give them the slip,' I said.

I heard him chuckle.

'Oh, I stood behind the door as they passed in,' said he.

We pressed on recklessly down the narrow, stony bridle-path, which fell away rapidly to the gorge below. The hazardous moment was yet to come, when, leaving the obscurity of the woods, we should begin to gallop across the open plain towards St Quentin.

'We must keep well from Essigny,' I said. 'The enemy are there.'

'Then the saints be with us! The Path of St Peter is our only hope,' returned Maher. 'But we were not bred among the Irish bogs for nothing. Now!'

He put spurs to his horse as we dashed out of cover of the woods into the clear light of the moon.

At the same instant we heard a hoarse shout. Our fears were realised. Rochefort's men, who had been lying in wait for our appearance, gave chase. Luckily we broke cover in the right direction, and for some miles kept the start thus gained. The wind sang in our ears as we sped across the rough country, hoping to strike the road beyond Essigny. The furious pace was beginning to tell upon the horses, especially Maher's, as with outstretched neck it lagged more and more. At length we reached the road. Here the easier going relieved our straining beasts for a time. But Maher was a heavy man, and hard upon his horses, from a habit he had of sitting loose as it galloped, and it was soon only too clear that the men behind were drawing up.

'They gain at every stride,' he said. 'You must ride on with this, boy, sink or swim, by St Peter's Path. I stop at the mill.'

At the edge of the morass, a ruined mill with a group of alders about it cast a deep shadow—the first for miles—across our way.

The foremost of our pursuers fired a shot, then another. Maher threw up his arm; then, leaning painfully out of his saddle towards me, he tried to hand me the white bundle of despatches. Twice I essayed to grasp them, but his shaking hand evaded mine.

There was a harsh cry and a quickened beat of hoofs behind us.

'You are wounded!' I said, as I seized the papers.

'It is nothing. Ride like the devil, boy!'

Into the shadow and out again, and Maher was gone from my side. Shots echoed behind me. I turned my head. The Frenchmen were coming straight on, having fired into the alders as they whirled past. Then came Maher's answer short and true, and the horse of the last man rolled over with its rider, kicking convulsively.

By this time St Quentin rose in full view, towering above its ring of marsh and water. To the left of me lay the Spanish camp, while all around me spread stretches of dark swamp, through the heart of which I must thread my perilous and difficult path.

I had now reached the point when I must leave all of certainty behind me, and trust to the recollection of my hasty study of the plan and to the instinctive judgment born of early experience in similar places.

The riders in my wake were fast making up to me when I plunged into the morass. They stopped, as I expected, and watched my progress, believing that instant destruction awaited me. But soon, seeing that I passed safely over the quagmires, and especially as I seemed to be going towards the city, they made up their minds to follow. My tired horse laboured gallantly through the sticky, evil-smelling ooze, into which it sank at times to the fetlocks. It was slow work, but I pushed steadily on towards the twin pools. Very still and threaten-

ing they looked, glittering black in the moonlight. The chill of the marshes ate into my bones, and I turned sick at the thought of a death in the foul mire of these waters. But I pursued my way between them, my gray, failing at every step. A shot flew past me.

The willow at last, scarcely visible above the surface of the swamp! The supreme moment had come. I forced my unwilling beast into the dark, oily water, and watched it creep to its knees. Had I missed the track? No; the water began to grow shallower; that danger was past!

Meanwhile the troopers, seeing my plunge into the pool, which altered my course from the direction of the city to that of our camp, imagined that, in despair of otherwise escaping them, I had committed myself to the mercies of the water. They stopped, and as I was still within range, they fired, but failed to touch me. Perceiving, however, that I had succeeded in crossing the pool, and had indeed gained firmer ground near the spread of reeds beyond, they took heart and splashed in after me, meaning to head me from the farther bank.

But in their haste, and doubtless emboldened by the immunity they had so far enjoyed in their adventure among the marshes, they took less heed than at the first to follow warily in my steps, and thus they turned into the water almost abreast some paces below my guiding willow.

I sought to urge my panting horse to better speed, when there arose behind me a hideous confusion of sounds—the snorting and plunging of the terrified horses as they felt the black mud suck round their helpless hoofs; the cries and curses of the riders, who now realised too late into what a grievous strait their overconfidence had brought them. They were beyond all human help, I knew.

Then the clamour sank.

In the silence I glanced back. The sinking moon shone full in my eyes athwart the pool. I saw nothing but the face of the sluggish water gently moving and a patch of foam rocking on the dying ripples.

I scarce knew how I rode till the challenge of a Frisian sentry roused me. I made my way to Count Egmont's tent, and was at once admitted. He sprang from his couch to meet me, with a score of rapid questions, as was his wont.

I handed him the white roll of papers, explaining their important contents in as few words as possible.

He opened the roll. Surprise, chagrin, then a flush of rage surged over his handsome features. He flung the papers at my feet.

'The shell is here, but where is the kernel?' he cried.

Bewildered, I stooped to pick them up. What unhappy blunder had I been guilty of? I pressed back the curving parchment. It was blank!

The shock and shame of the disappointment overcame me. My eyes seemed to fill with blood, and I dropped senseless where I stood. When I awoke as from a deep sleep, in the soft summer morning, I found myself in my own tent, and a face looking into mine which I had scarce hoped to see again.

It was Maher, ruddy as the rising sun.

'The despatches?' cried I.

Maher laughed. 'I handed them to the Count two hours ago.'

'Then I was a mere decoy?'

''Twas all that could be done. I foresaw that such a thing might happen if we had to ride for it, and tied the despatches into two bundles. 'Twas that kept me at the inn.'

'And you have no wound?'

'None. When the coast was clear I simply came into camp by the longer road.'

'And the Count, what said he?'

The flap of the tent was raised, and the Count himself entered.

'He said 'twas a brave ride over the Path of St Peter, and was fain to ask what reward the young gallant most desired.'

I threw myself at his feet.

'The honour to ride on another such errand for you, my Lord Count.'

THE END.

# ONE HUNDRED 'FIRST NUMBERS.'

PART II.

## WEEKLY LITERARY PAPERS.

FORTUNES have been lost in the last twenty years in floating weekly papers devoted to the interests of literature. The steady drift of advertisements of books to the daily papers has made it almost impossible for new weekly journals to gain revenue in this direction, and of course the sale of such papers is too limited to be remunerative. Yet 'hope springs eternal in the breast' of young men who are burning to express their opinions on current literature. Sometimes the promoters have not been young, but experienced journalists like Mr Frederick Greenwood; but, whatever their age or experience, the result has been the failure of most of these reviews at a total cost which must have reached at least two hundred thousand pounds in twenty years. Take three examples. The *Speaker* failed despite the most eminent support, and though it had weekly contributions from men like Dr Fairbairn, Mr Birrell, Barry Pain, A. T. Quiller-Couch, and a host of other writers. The *Pilot* failed though it was edited by D. C. Lathbury and printed some fine work, including 'The Road-Mender,' which

goes on selling in volume-form to this day. The *Anti-Jacobin* could not hope for success with such a mysterious title, although it was edited by the man of whom Lord Beaconsfield said, 'I always feel I am in the grip of a statesman when I read Greenwood's articles.'

The first number of the *Realm* appeared on November 16, 1894. It was intended to be a source of strength to the Conservative party. In No. 1 there were some amusing stories of Father Healy. 'On being asked what would Mr Tim Healy be when Home Rule came, he said at once, "'An old man."' When he was at Monte Carlo a friend tried to induce him to go to the gaming-tables. 'The room is like a cathedral.' The witty old priest said, 'Ah, there is all the difference. In a cathedral they pray for a man; here they prey on him.' Right at the end of this first issue of the *Realm* I find a story signed Warwick Simpson. Surely that was the early pseudonym of Mr Pett Ridge.

I have the last number of the *Pall Mall Budget*. It ended in March 1895, it was said owing to the death of Mrs Astor, the proprietor's wife. The *Budget* was in its first form a brilliant production, edited by Mr Charles Morley. Its concluding issue had a story by H. G. Wells, and charming sketches by Phil May, Lewis Baumer, E. J. Sullivan, F. H. Townsend, and others. It was a brilliant but pathetic finale.

Not many people recall the *British Review*, a threepenny weekly paper, formed avowedly on *Spectator* lines, as so many other papers have been. The best thing in the first number was a poem on 'A Deserted Palace,' signed Violet Fane; she married Lord Currie, who was British Ambassador at Rome.

The *Academy* made a new start in November 1896, under that gifted writer Mr Lewis Hind. He had been editing the *Pall Mall Budget*, but the *Academy* was more in his line. I was very sorry when vicissitudes overtook the paper in its early career, for it was full of pleasant writing. Mr G. S. Street wrote on the Drama, Mr J. S. Sherlock on Music, and Mr Hind's witty work was a regular feature. The *Academy* began in October 1869, under Dr C. E. Appleton. Mr J. S. Cotton was its editor for several years. Despite the fact that many thousands love literature, it seems as though only one or two weekly papers sufficed for their needs. Mr Hind left the *Academy*, and is the art-critic of the *Daily Chronicle*. The *Academy* is still in evidence.

The *London Letter* was a sixpenny weekly review which was edited by Mr Algernon Locker and Mr Stafford Ransome. Its policy was declared to be 'Palmerstonian,' but people had moved onwards, and this policy did not secure the paper's success.

The *Week's Survey* was an attempt in 1901 to found a penny literary and political review. Its first article pleaded for a centre party in politics. Sir Wemyss Reid—who knew how hard it was to keep a Liberal review running—wrote on 'The First Liberal Imperialist—Mr Forster.' Mr George Radford published the paper, which did not long survive.

A dignified but dull weekly review was *Literature*, one of three or four unsuccessful enterprises of the *Times*. The first number came out in October 1897. Mr H. D. Traill edited it, and in the first issue Rudyard Kipling's poem 'White Horses' appeared. With all the splendid resources of the *Times* at its back, *Literature* ought to have done better; but it contained too little news and gave too many long reviews of uninteresting volumes.

When the *New Review* ended, the *Outlook* appeared. It was threepence a week, and had an excellent editor in Mr Percy A. Hurd. To its weekly issues many good writers—notably Mr George Wyndham, M.P., W. E. Henley, H. G. Wells, L. F. Austin (prince of after-dinner speakers), and Sir Herbert Maxwell—contributed. I am able to state that Mr Wyndham was the writer of a singularly beautiful article on Mr Gladstone, which gave the dying statesman and his family extraordinary pleasure by its affectionate sincerity. The *Outlook* is now more associated with the Unionist party, and ranges itself with the other sixpenny weekly reviews.

Mr A. Kalisch, who was once musical critic of the *Star*, started the *Londoner* as a twopenny weekly review in 1900. W. H. Pollock, Edward Clodd, W. J. Locke, and C. L. Graves gave a helping hand in the first issue; but it did not become indispensable, and that is a test of success in journalism.

Methodists in the north were offered the *Methodist Weekly* in 1900. Its first editor was Mr Hudson, who had written stories under the pen-name of Harry Lindsay. The Methodists, however, seemed satisfied with well-established weekly papers, and this one succumbed. That reminds me of the fate which has befallen several denominational weekly papers in the last few years. The religious public seems less inclined than formerly to support papers devoted to denominations. The great success of the *British Weekly* (whose first number I treasure with special interest, as I helped to print it) has been achieved by the width of its interests—ecclesiastical, social, and literary. Its history is a record of persistent triumph over difficulties, and redounds to the lasting credit of its brilliant editor, Sir W. Robertson Nicoll, LL.D., one of the hardest workers in journalism.

It was on November 14, 1902, that Mr T. P. O'Connor's long-heralded literary paper, entitled *T. P.'s Weekly*, came out. As it has hardly altered in the succeeding years, there is no necessity to describe its features. The first serial story in *T. P.'s Weekly* was 'Stella Fregelius,' by H. Rider Haggard. As the years have gone on, the answers to correspondents have proved a very popular feature.

The *Review of the Week*, started in November 1899, went through various vicissitudes before it came to an end. It aspired to be a penny *Spectator*—an impossibility. George Gissing wrote on 'Tyrtæus,' protesting against poets raising a blood-thirst for war. George Bernard Shaw had an amusing article on 'Trials of a Military Dramatist.' He

says sarcastically: 'It is just about as possible for Tommy Atkins to be a marksman as it is for him to play the fiddle like Sarasate.' Another article is on 'The Painless Extinction of Persons over Forty.' In the same field of weekly literary journals appeared the *London Review* in 1898. I believe it was edited by Mr Oswald Crawfurd, C.M.G., and Mr Edwin Oliver. It was dull in contents and appearance, with articles by Dr A. H. Japp, John Leyland, and others. What thousands of pounds have been sunk in attempts to found weekly literary journals!

PENNY POPULAR WEEKLY PAPERS.

Immense sums have been dropped in starting penny weekly papers during the last twenty years. Only a very few of those first numbers in my collection are now represented by profitable papers.

*Stories* was a penny weekly paper which rose to a circulation of about fifty thousand by January 1898. I believe Mr Harvey du Croz was interested in it. Its editor was Mr J. F. Williams. Who recollects the *Longbow?* It was edited by Mr Henry, of the staff of *To-Day*, and had sketches by Dudley Hardy, a serial story by Rider Haggard, and other attractions. But it could not make itself indispensable.

The *Lawyer* was a penny illustrated weekly paper. It had good portraits of Lord Alverstone, Mr Asquith, and other leading lawyers. There have been several ephemeral legal papers, written, I presume, chiefly by the junior Bar before briefs took up their time and energy. The *Onlooker* at threepence weekly started in 1900, under the editorship of Mrs Harcourt Williamson ('Belle' of the *World*). One of its novel features was signed 'Lists for the Libraries,' by eminent folks like the Duchess of Sutherland.

What strenuous efforts have been made in trying to counteract the 'penny dreadfuls' which circulate among boys! But I am afraid, despite the success of the *B.O.P.*, *Chums*, and other papers, the world of boys remains loyal to the lower type of periodical. Here is the first number of *Boys of the Empire*, dated October 27, 1900. It had good stuff in it, and was under the guidance of experienced men like Mr Andrew Melrose and Mr H. H. Spicer.

It is eleven years since the *Home Magazine* was started by Messrs George Newnes. Its first editor was Mr George Clarke the missioner. It was a penny weekly, and it was stated that 'no expense will be spared to produce the best magazine that it is possible to produce for a penny.' Mrs L. B. Walford wrote the serial. However, the magazine did not secure sufficient support, and it was amalgamated later on with the *Sunday Strand*.

The *Unicorn* was started in 1895, under the editorship of Mr Raven-Hill, who is now one of the chief artists in *Punch*. Its first number contained a clever sketch by Phil May, showing his resemblance to Pope Leo XIII. The literary matter was very ordinary, and was set in unattractive type. The price of this weekly paper was threepence, though it had only twenty pages of letterpress. Not even the capital sketches could save it.

One hundred thousand copies were issued of No. 1 of *John Bull*. It was a humorous weekly paper, edited by Mr Arthur W. A'Beckett, formerly of *Punch*. Harry Furniss designed a striking title-page, and Sir Lewis Morris had a Coronation Ode, for the paper made its bow in June 1902. But as I have said before, the British capacity for comic papers is strictly limited. The title *John Bull* was assumed in later years by Mr Horatio Bottomley's paper.

*Smith's Weekly* was issued in 1904, one of the army of penny journals which storm the citadel created by *Tit-Bits*, *Answers*, and *Pearson's Weekly*.

The *Minute* was said cruelly to have lasted a little longer than its name. It began in January 1896, under Mr C. N. Williamson, formerly of *Black and White*. The first picture in the little weekly paper was of the capture of Dr Jameson by the Boers. The *Minute* seemed to be gaining a hold on the public just when it came to an end.

In October 1897 *News of the Week* appeared as a Saturday morning penny weekly journal. Its editor was Mr C. Herbert Grinling. I possess two 'first numbers,' yet each is dated differently and has a different shape. A short story by Robert Hichens is refreshing amid the morass of police reports, &c. The paper made a gallant fight.

Mr C. Arthur Pearson tried to reach a new public with a penny weekly called *Girls*. This was in 1897, but the paper did not receive enough favour. I have never forgotten 'A Very Improbable Story' which was in the first number. It was anonymous. The *Scots Pictorial* was another débutant in 1897. It had some fine half-tone illustrations of Inveraray Castle and the Duke of Argyll. There was an account of the memorial to Dr Wm. Alexander, the author of *Johnny Gibb*, a Doric classic. It is still to the fore.

A lot of money was dropped on *Men and Women*. It appeared first in 1903, 'edited by G. R. Sims.' One of the articles was by H. W. Massingham on the 'Private Secretary to the Prime Minister.' It ends: 'If the private secretary would only tell what he knows! But he never will.'

Another Newnes enterprise was *Fun*, an old paper revived under the lively editorship of Leslie Wilson and P. W. Wilson. The latter is now M.P. for South St Pancras and the parliamentary sketch-writer for the *Daily News*. *Fun* ought to have lived; it was very witty, and had brilliant sketches by Raven-Hill, E. J. Sullivan, Sauber, C. E. Brock, and other artists. But clubs, restaurants, and hairdressing saloons which used to 'take in' all the comic papers have 'verted to the daily journals.

Here is the first number of *M.A.P.*, dated June 18, 1898. It was 'the realisation of a scheme I have had in my mind for at least eight years,' said Mr T. P. O'Connor, M.P., its founder. For ten years it maintained an almost identical form, but

lately it has tried experiments in type, &c. Mr O'Connor has been a volatile force in journalism, and in *M.A.P.* he was a pioneer who has been imitated but not excelled.

A paper called the *Rocket* was an unfortunate exemplification of its name. 'We shall be told by "candid friends" that our name is ominous; that if we *do* go up like the rocket we are bound to come down like the stick,' said the editor. The paper contained a long article by Clement Scott, whose pen was always in demand for new ventures.

The *Lady Cyclist*, edited by Charles P. Sisley, tried its fortunes in 1895. I notice in the first issue an interview with Miss Lillias Campbell Davidson, who was then a pioneer among lady cyclists and a busy contributor to all papers devoted to cycling.

The *Wheel of Fortune* was an attempt by W. G. FitzGerald in 1903 to add to our penny popular weeklies. A curious item in No. 1 was a short poem by Flora Annie Steel the novelist. Among other similar ventures there was *Anecdotes*, of which Mr George Knight, formerly editor of the *Porcupine*, was a moving spirit in 1896. It offered thirty-one shillings and sixpence for the best anecdotal paragraph, truly munificent pay.

An Irish M.P. was concerned with Mr Henry Reichardt in starting in February 1902 *Chic* as a twopenny weekly paper for ladies. It devoted most of its space to fashions.

I think the death of a little weekly penny paper with the curious title of *V.C.* was regretted genuinely by a large circle of readers. It was a very readable paper, with a vein of real originality, and it brought Harold Begbie to the front if it did nothing else. In March 1904 it was amalgamated with another weekly called *Competitions;* but, though in illustrations and matter it was far ahead of some of its contemporaries, it passed away, mourned, as I said, by many.

The *Coloured Pictorial*, started in 1902, was one of the first papers to employ the three-colour process. For twopence it was a wonderful production. The *Easy-Chair* was superior to the generality of penny weeklies. Arthur Waugh wrote reviews for it, and it was printed well. But, alas! it succumbed.

The *Golden Penny*, issued from the *Graphic* Office in 1895, improved on its first number, and attained a very large circulation. Looking at the half-tone illustrations in this first issue, one can realise how far we have travelled since in the art of reproduction. A curious paragraph related to Monsignor Capel, formerly a famous Roman Catholic ecclesiastic; it stated he had become a Californian ranchman, and was very wealthy. It used to be said that Capel was the original of 'Catesby' in Disraeli's novel *Lothair*.

The periodicals mentioned in this article are probably only one-tenth of the total number which have been started in the last twenty years. What a proof of the development of journalism in this period we have as we look at the railway bookstall crowded with periodicals dealing with almost every belief, trade, and recreation! No one will have an excuse for being ill-informed in the future.

---

# THAT BIG TROUT.

By the Reverend E. ADRIAN WOODRUFFE-PEACOCK, F.L.S., F.G.S.

UNDER the low escarpment, called the Barf by our Danish fore-elders, which it has been fretting and cutting away these thousands of years—ever since the great ice-sheet laid down the chalky boulder-clay the hill is composed of—runs the beck. It is only an ordinary brook, some fifteen feet wide, flowing eternally along its bed of varied sand and pebbles, and carrying its wearings and the weatherings of the wold—the great chalk-hills on the east from which it springs—to the dead level of the embanked carrs or peat-flat; but it is still a perpetual demonstration of many immutable laws of nature. Beauty is truly in consciousness of the beholder, not external to the man; it is only apprehended by the eyes of the trained mind. The beck proved this to us one bright summer morning.

Descending the incline above the hunting bridge one glorious June day with a native who lived close by, we inquired if he did not see any loveliness in the view before him. 'I see nought new. I've looked on it all a hundred times before. Let's see now;' and he spoke in the most matter-of-fact voice and way, as if he were summing up the points of a Christmas bullock. 'There's the hill, and water, and wood, and rising ground, and the town in the distance amongst the trees. I've seen 'em all before. The market-town means men, and that means food. The crops o' corn growing here and there, as you may see, to feed 'em. There's yon sheep on the turnips, and the cattle in the pasture. Now, give me the job o' sitting by a woodside a day like this to hear the corn a-growing as the winds sough through it. I can see a beauty in that. It means harvest wages for families wi' many mouths and feet, and thrashing days in winter, wi' extra pay, when work is slack and hard to come by. It means a lot; I cannot say the half—folks and beasts fed, and God thanked. Amen. That's the beauty o' the country in a growing time. I cannot say as I sees any other.'

'Amen!' we said too, for this son of the soil was at least thankful for something. He was a true child of his environment. Had he been left by a woodside 'to hear the corn growing' the squire would have been many couple of rabbits and a few hares less by the evening. He saw in the scene

before us what his training fitted him to look for, ignoring the game as beside the mark just then.

The view was an ideal one of sweet country charm and peace. The landscape sweeps down on every side to the rippling waters of the winding stream, whose quiet pools reflect every dimpling cloud that passes overhead. On the north, over wooded ground, a huge shoulder of the wold stands out prominently, and constant lines of white steam below it betray the hidden presence of the busy junction. On the west lies the little market-town, ruined because a former squire forced the railway junction from its precincts. Far away beyond, on the skyline over the great woods of the county, the smoke of the ironworks comes into evidence, made hazy by distance, a proof that man—as a smelter of iron, as he was there in prehistoric times, and now a maker of steel and basic slag, and as a seeker for coal—has destroyed the wild beauty of those wind-blown commons with their old-world flora in his lust for the wealth of nations, which lies hardly buried below the surface soil. Just to the north by the beckside comes the Barf wood, a trifle of untouched nature, for the plough has never scored its surface yet. The steep incline and poor clay have proved 'too stiff a job to pay.' Too much, also, even for some of our sweetest woodland flowers, such as the primrose and wild hyacinth. On the south, for some distance, a narrow line of trees follows the course of the stream, till all at once it reaches the fenland level, and runs between banks made by man from its own alluvial gatherings to protect the cultivated peat-fields. It was a scene, that glorious June morning, instinct with beauty, full of life and action, pregnant with teaching, from the history of its rocks and soils to the crowning efforts of man's handiwork.

It was not, however, an ideal trout-stream, or one easy to fish; but the big trout and his following were there, and so my story is of it. It is not an invented tale, but plain, sober, everyday history, romantic and tragic, like life itself; truly romantic from the number of broken casts, rods, and reputations left behind. There was one pair of spectacles at least lost in the quest. The good sportsman they belonged to had hooked a fish—if not 'that big fish'—and could not stoop to pick them up. When he had landed his pound prize he could not see without his glasses where they lay; so the beck sand buried them, and they remain a relic of conquest. Tragic, for the end of life is always that, however bright and glowing its active moments may have been.

The failures that old hunting bridge has seen! Luckily it cannot repeat all it has heard. Prodigious is the only single word in our mother-tongue that exactly expresses everything—the frequent scenes of disaster by the pool and the language of those gentle and patient fishermen. It was exceptional in all ways. Every visitor had the best of reasons for his many failures, and in his vexation talked much of his disappointment. The slight curve above the bridge, the overhanging thorn-tree, the suddenly shallowing waters on each side of the pool, the six-foot deep and twelve-foot wide cavern under the roots of the tree, the high, steep banks, and that unnameable bridge itself—everything was 'well called' except the angler's want of art and bungling. We always smiled kindly, but ever made the same comment, 'Ha! you mean you did not get him.' Some of the would-be Waltonians with hopelessly lost reputations were quietly riled; some rushed off again to meet further failures; the naughty one used pictorial, not piscatorial, phraseology; the wise ones smiled—smiled sadly, we mean, as we had done when we owned ourselves beaten. The big trout lived on, and flourished, eating his children and grandchildren with evident relish.

His former history was simple, and well known to a few old friends. Ford's fish-hatchery at Hundon was flooded by a sudden semi-tropical shower during a passing thunderstorm. Such a rush of water on the side of the wold was unexpected, and therefore unprovided for. In the height of the wash-out much fry escaped from the rearing-ponds down-stream, and finally reached the Aucholme. Such a streamless river—for it is nothing better than a canal—did not satisfy them. So the youngsters commenced working up its tributaries; and they or their descendants took possession of every likely spot in all the becks that feed the river. We at one time or another, before we gave up fishing, accounted for a good hundred of them. Eight taken one afternoon on another beck scaled sixteen pounds two ounces. They were own brothers in growth, and were some of the original fry, we believe.

The big trout, to judge from his age and size, was another of the escapes, but as he was not 'earmarked' this must ever remain a conjecture. His weight, too, must be a matter of doubt, as he was never on the scales. The best judges, when he was fully fed up, put him down at 'better than five pounds.' Whatever were his defects from the fisherman's point of view, and fry-eating was his worst characteristic, he had a mind of his own, and a way that showed it. Nothing could demonstrate the fact more clearly than the position he chose for his abode and following. A four to eight inch flow of water between nearly upright banks led to a pool in the bend of the stream not more than two feet deep and thirteen by fifteen wide, with a cavern below the roots of the wide-spreading thorn-tree. Not a foot beyond the foliage, which extended to the other side of the stream, came the wooden hunting bridge of reprobate memory. Under it the water ran no more than five or six inches deep, with another slight bend and smaller pool and cave just beyond the bridge. It was these many-rooted caverns in both pools which defied the skill of the best fishermen, in conjunction with the bridge and the big trout's wide experience. If he were not found in one, he was always to be detected in the other pool or cave. Many a time have we seen him cross from one to the other as the

case might be, his broad back well out of the water; but never did he stay in the pool on such occasions—he retired into hiding immediately. The smaller fish of edible size forsook the pool or cave at once for the shallows, where they were safe. By watching their actions it was always possible to tell where he was laid up.

The hunting bridge was the insurmountable difficulty in getting him, for, whichever side of the woodwork he was hooked on, he crossed over to the other the moment he felt the prick of the barb. With a few skilful turns round the roots in the cavern he tied up the line, and then took his own time to work himself free of the encumbrance. While he was still young he was twice landed on the bank, but when he touched the ground and the pressure was off, he was as quickly back in his native water through sheer bungling on the part of the fisherman. There in his self-chosen stronghold, when he was fully educated, he defied the united fishing skill of the neighbourhood and of such outsiders as heard of him.

Men of low sporting instincts even shot at him, but not knowing the trick, invariably missed their reward. In this way he is believed to have lost the use of his left eye, but he could see as well with one as most fish can with two. Another occasion found a party, with any amount of show in fishing-tackle, by the bridge pool in the evening. Borrowing planks, spades, and buckets, they made an attempt to stop the flow of the beck and bail out the pool. As they did not understand the proper methods for such work, a burst dam and thorough wash-out carried them down-stream some distance, and brought their ineffectual efforts to a sudden, wet, and inglorious conclusion.

When we at last arrived on the scene the big trout was an aged and educated fish, too large for the confined limits of his waters. No lure would he notice, not even white moth in the moonlight. We persisted till we found the place was impossible. We hooked him no less than three times, and always by means of a bare bright hook on gossamer tackle in the brightest sunlight. It was trifling, for such gut was useless with a fish of his weight and knowledge. The old sportsman who told us how killing a bare hook was sometimes on educated fish had met with some curious experiences in his time, but never with a fish in a position quite as difficult as this one. We gave him up at last, and fishing at the same time, but in no spirit of vexation—the frame of mind of the boiled cockerel which calls 'cockadoodle don't.' We kept on the watch, and have spent fruitful moments, running into many hours at one time or another, on the hunting bridge, studying the big trout and his surroundings.

It came about in this way. Age makes a man full of new interests, and more kindly disposed towards his fellow-creatures. The last time we took our rod and flies it was with the hope of catching some members of the big trout's following, as we had frequently done before. As we came down the Barf incline we perceived in the distance a much more expert master approaching the spot, and pulled up to watch the outcome. A heron was slowly winging its way up every curve of the stream, and when it came to the pool, or more likely saw a trout in the water, it took a magnificent circular sweep over the field beyond the wood, and settled down some distance below the bridge. From that point of vantage it made a stealthy approach with measured gait, till it found a suitable spot for 'sentry go' within striking distance of the lower pool. The thought that flashed into our mind at once was: 'Is this bird to do what man has failed to effect? We will watch and see the result.' We did, and found the sport far more engrossing than fishing. It proved so interesting that we never took the rod out again, and never shall now. We shall fish for ever, we hope, with good luck, though not with the rod, line, and fly, but with the lure that lands facts—with the meditative mind. We watched the bird that day through a screen of privet, and later, on many subsequent occasions, from one side of the bridge or the other. The circumstances of the situation were almost as difficult for it as for the human fisherman. It proved more persistent than we had been, visiting the spot early in the morning, during the day, and after the shades of evening had fallen, for it was frequently disturbed on account of the footway over the bridge. In the end, however, it was no more successful than others had been. It did not catch the big trout; though, like the rest of us, it was rewarded by a few of his less wary followers. I cannot tell on this occasion the tale of that bird's efforts.

Summers came and went, but the big trout defied all efforts to take him. How I wished that an otter might come up the stream! for he would have done the trick at once; but one never did come. The cuckoos came to drop their eggs into the nests of unsuspecting wagtails, and haunted the beck, for they are thirsty birds, and love also to sun themselves on its sandy banks. The kingfishers built below in a hole on the upright face of the stream-side. Many a time they flew under the bridge when we were on it, a blue sheen of glory, with the big trout's offspring in their bills. The swallows and sand-martins hawked the stream, and took the fly the educated trout either dared not or would not touch. We saw all this frantic struggle for existence, and mused over it. The water-voles feeding on the cow-mumble (*Heracleum*), along with the field-mice and bank-voles, were constantly hunted by weasels and stoats. Everything was preying on something else. As the seasons came and went the pool was fully frozen over in the spring of 1895. The fox left his pad-marks on the snow blown over the ice under that thorn-tree as he hunted for a supper of voles, but the big trout remained untaken. How he lived that spring through I cannot imagine. He lived by his wits, the life of a cannibal, and luckily, not being visited by an otter, survived.

It would give us pleasure to state that he died

from choking in the act of swallowing one of his great-grandsons. Such an end would have been well merited, but it would not be true history; it would have been too ethically romantic. He was on the gravel shallows higher up-stream with one of his followers, in the act of spawning, when the end came to his long-sought life. The tenant of the farm perceived him, and a well-directed blow with a hazel rod brought an end to much cannibalism and as masterful an existence as we have ever met with in fishing records—not stories, mind; there is no limit to them. He was poor eating, we were told, though very finely coloured in the flesh; and have no reason to doubt it, from the years he was known.

We have given up fishing with the rod, for we were fairly beaten by honest means. We knew how we could have secured him easily, but could not stoop to it. Sport *is* cruel enough; anything outside is barbarous and little better than poaching. So we watched the big trout and his cruel ways, with the swallows, martins, kingfishers, heron, and water-hens, and all the mammals by his pool; and it was a liberal education. So few can watch, and it is so good for men to observe and think sometimes without any desire to take part in the destructive battle that is waging all around them. The fish in the waters, the mason-wasp building on the bridge, the old fisherman with the long legs who failed as conspicuously as we did, or the little blue bird from his barren perch diving for his smaller prey, the cuckoos with their cozening ways and love of caterpillars, the struggles for existence in the floral growth in the stream or on its banks, in which the opium poppy took part for years in the most curious way, all showed the battle that life implies. It was good for us to sit aside from the conflict to watch a while and learn, to seek after that true knowledge which should be light and wisdom for all who can find it.

---

## THE TREACHERY OF THE SEA.

And I looked upon the true sea—the sea that plays with men till their hearts are broken, and wears stout ships to death.—CONRAD.

THESE words, by one who knows the sea for his enemy, have often recurred to me as I leant over the shaking bow of some great liner that was putting leagues of Atlantic trouble between me and home. You get this measure of the sea's wolfish treachery in the sea-books. It has no code of honour, this sea of ours. Fair-play is foreign to its spirit. The weaker the foe, the harder it strikes. Now and then it puts forth its futile strength against the great hulks that mock its fury between the Mersey and St Lawrence, but more often it holds itself in reserve for some helpless tramp, which, though more defenceless than many a wind-jammer, angers the sea by assuming the dignity of steam.

The ocean is a good servant when flogged, but a bad master when feared. It helps those only who help themselves; it fawns to the strong, but is pitiless to the timid. There are men who profess themselves without fear of it, but their indifference only measures their ignorance. Those fear it most who know it best. Addison could write delicately of the 'agreeable horror' of a sea-storm, but Addison was a better essayist than traveller. Aristotle came nearer the truth when he classed it, with earthquakes, as among the phenomena all men must fear. That is the Greek view of it to this day, and recalls the Hellenes in *Eothen*, 'pale and grim under their hooded capotes, like monks awaiting a massacre.'

Landsmen usually make the mistake of fearing it only in its rage. They are cowed by the hissing combers which hurl themselves with gathering strength against the timbers of the ship or the buttresses of the land, like ravening beasts falling back from their prey with dripping jaws. They are daunted—and no wonder!—by those running mountains of green tipped with white, suggesting a snow-capped range gone mad. The vessel, reeling under their impact, as she painfully claws her way a little farther from a lee shore, looks every moment as if she must broach-to and founder. In these tremendous moments of unrestrained paroxysm, the landsman closes his eyes and forgets to pray, since science and faith seem alike unavailing.

Yet to the informed eye of the seaman the oily calm of the ocean often brings a more baneful message. He knows that there are claws beneath the velvet, and that this deceptive mood is but the purring of a tiger before the spring. Raging or purring, it is always the enemy. '*Elle rugit, puis moutonne*,' says Hugo—first the bellowing bull, then the bleating sheep, always the foe. And since a blustering enemy was ever less to be dreaded than one who plots quietly, there is a terror in the silence of the sea.

There is none of this cunning in the calm which comes after a storm at sea. That is no more than the exhaustion of the elements, a benediction, a truce. The wind dies away on far horizons. Even the sea seems for a moment content that its ally is gone elsewhere, and that it has no choice but to smile under sapphire skies.

Our own seas, lying outside the zone of typhoons and hurricanes, do not pass so rapidly from the peace of God to these fits of terrific rage; but in the tropics the transition is instantaneous. I recollect once, off Santiago, on the south shore of Cuba, where Cervera found his last ditch, seeing the Caribbean change from a dream-like stillness to a black maelstrom of devilry within an hour. That was the

first and last occasion on which, in skies ranging over a hundred degrees of latitude, I ever saw the cloud literally no bigger than a man's hand come up from the skyline and burst over the land. Another day, off the low Keys of Florida, I saw the Gulf of Mexico change from the calm of death to the frenzy of a homicidal maniac in a few minutes, and this time the hurricane came suddenly out of a cloudless sky, and the low trees on that coral strand whispered no warning ere the scene was pandemonium.

Here is treachery such as the sea delights in. I recall a worse case yet. A great cargo-boat lay at anchor in one of the smaller Queensland ports, a little south of the Barrier Reef. The sea was like glass, and a continuous procession of roomy lighters, laden to the water's edge, brought wool and gold from the wharves, and donkey-engines brayed merrily over yawning hatches. It was a sultry September evening, and blue lightnings stabbed the blackness over the hills. It was such a calm as would have cozened a landsman; but the captain, who had bought his knowledge with white hair on the sunny side of fifty, saw beneath the surface, and telegraphed an order from bridge to engine-room. Of a sudden the wind, coming out of the south-east, whistled up the hell-hounds in a white line that bore swiftly down upon our anchorage. But the anchors were already out of the mud, and we steamed hastily away northward into the shelter of the Barrier, leaving the half-full lighters to wait for the next boat. Doubtless the fortnight's delay would chafe the good traders of Bradford, impatient for their wool, and would annoy the Bank of England, looking for its ingots; but it was better to keep them fretting at home than to go to a destination where bills of lading do not run.

The Gulf of Mexico is one of the most unprincipled of seas. The quays of Galveston know its wickedness. Yet I have found it in gentle mood enough, and I once crossed from the isthmus to New Orleans in a little tramp that first gorged half a million bananas at the port of Costa Rica, and then lurched north through tranquil seas, which could in other mood have sent us and the fruit to the bottom, to the old French settlement on the muddy Mississippi. And again I knew it, two years earlier, in a yet smaller craft, crossing from Tampa to Key West, just at the beginnings of the Gulf Stream, where that beneficent current rounds Cape Sable. As I leaned over the bulwarks and looked on the sunny shore of Florida, it seemed to me that our national debt to that stream has been, when one comes to think of British weather in a perspective of three thousand miles, somewhat exaggerated; but this must be heresy, as every geographer joins in its praise as the author of the mild British climate.

Only when the sea is dominated by the land can its treachery be ignored. Within the Barrier Reef, or in the lovely landlocked scenery of Puget Sound, between Victoria (B.C.) and Vancouver, I have watched it robbed of its sting, impotent, servile, cringing to those whom it is powerless to harm. It is in the great Southern Ocean, which heaves between Australia's unfriendly coast and the polar ice, that one gets the most tremendous impression of boundless space and power without limit. Since the days when I tossed on helpless liners in the Bight, with albatrosses and mollymauks wheeling round the rolling vessel, Scott and Shackleton have lifted a corner of the veil from off the face of the cold and mysterious Antarctic; but in those days, when we had forgotten the remote discoveries of Cook and Ross, all that lay beyond the southern skyline was baffling enigma. To-day, with the return of one expedition from the frozen nurseries of penguins and sea-lions, and the departure of another, that gloomy Southern Ocean might perchance lack the terrors of the unknown, but fifteen years ago the immensity of it was awful.

North, south, east, and west, the sea weaves its spells. Its food is prepared for it from the Dogger Bank to the Cape. A cunning enemy, it can afford to be patient, knowing that its chance will come some time. It plays with men as a cat plays with mice. There is something almost sublime in its treachery. The land has no cunning like it. Earthquakes and volcanoes take their toll, but only in the zones that are their freehold, where those who choose to defy the elemental forces of Nature do so at their own risk. Those who go down in ships play the same hazard; but, since there is not room for all ashore, they must either do so or starve. This will be for all time. Railways or the conquest of the air may rob the ocean of more tender prey, but the fishermen and grain-carriers must always be sacrificed on its dim altars. And the sea, the unsympathetic, malignant, boundless, wanton sea, will still levy its cold tribute from the sons of men, will still leave the wives and daughters red-eyed beside empty chairs. Such is its hateful pleasure.

## A BIRD'S SONG.

A birdie sang, from a leafy spray,
His matins at dawn of one sweet day;
From a joyous heart each pearly note
Came bubbling up to his tiny throat.
Oh, green was the grass, and blue was the sky,
The birdie was glad, and so was I!

A fountain of joy was my breast that morn!
There were snowdrifts of bloom on the old blackthorn,
The tranquil air was so cool and sweet,
The daisies foamed round my dancing feet;
And I joined the bird in his gladsome lay,
And I thanked the Lord that I *lived* that day.

And ever since then, whenever I hear
The song of a bird rise sweet and clear,
I feel—though there 's sorrow and pain abroad—
That around and above and below is God;
And I go my way with a soul made strong
Because of the hope in a birdie's song.

# ONE GENERAL ASSEMBLY—AND AFTER.

By H. HALYBURTON ROSS, Author of *The Tutor of Tyndrach*, &c.

## CHAPTER I.

RED-LETTER days there are, I suppose, in every life, that stand out in the calendar of memory, reminder of some festival or the starting-point of a new epoch.

To Helen Campbell this particular May day was to prove such a fateful anniversary, though she had no suspicion of what was in store for her when she took her first look out of the window that morning over the familiar expanse of purple strath and mountain that surrounded the Manse of Muirton like a sea. It was all the result of a letter that her mother read through twice, and then handed across the breakfast-table to her father.

One glance at her face had told Helen that it contained important news, and she saw a confirmation of the suspicion in the minister's expression as his rather short-sighted eyes perused the contents. He laid it down beside his plate and gazed straight across the table at his wife.

'After twenty years!' he said.

She returned his look steadily; but Helen could not know that he saw in her eyes a revival of the old wounded expression he had grown to dread in the first years of their married life, when the post-bag had been searched in vain for an answer to her loving appeals to her own people. It was for his sake she had had to suffer the coldness, the neglect, and to forgo all the accustomed privileges of wealth and station; but time had proved for both of them that the sacrifice was worth while in the hallowing of their married love.

The appeals had ceased long ago, and the years of silence had created an ever-widening gulf between Mary Campbell and the friends and associations of her youth. Now this letter had come too late, as it seemed to her in the first flush of bitterness.

'I suppose we had better tell Helen?' she said at last, in her quiet, restrained voice.

Both parents glanced instinctively at the girl who was seated at the side of the table. Here at least was a triumphant enough indication of their union, yet mingling with their pride was an undercurrent of apprehension. Was not beauty often a tragic heritage, especially when unaccompanied by corresponding benefactions? And of Helen Campbell's beauty there could be no question.

That she was entirely unconscious of it herself rather enhanced its effect. The soul gazing out of the gray eyes was at this time the soul of a child, trustful and inquiring. She would have called the clear, creamy pallor of her own skin sallow if she had been asked, and the slight irregularity of feature that gave charm and character to her face she often bemoaned, comparing it with her mother's more classic contour. But the rare gift of beauty was there nevertheless, indefinable, yet to a prescient eye already charged with fateful possibilities.

'Yes, mother; what is it?' she echoed eagerly.

The minister answered for his wife.

'Your mother has had a letter from her aunts, the Miss Dalry Drummonds, in Edinburgh, inviting us all three to town for the General Assembly next week,' he announced in his deliberate accents.

Helen's face flushed, her eyes became luminous with excitement, then the colour faded.

'Of course we will not go,' she said in a little, proud voice.

The minister and his wife exchanged a quick glance.

On Mary Campbell's face a curious mingling of emotions were fighting for the mastery.

'There is no "of course" about it,' returned the minister quietly, and paused.

Helen's gaze travelled from one to another of her parents.

'They don't deserve that mother should go,' she declared at last with a fine loyalty, putting back her head.

[*All Rights Reserved.*]

'Hush! The wrong was to your father,' interpolated Mary Campbell quickly.

The minister smiled, a smile that spread an extraordinary radiance over his plain, rugged-featured face.

'It isn't the wrong we must think of to-day,' he said, 'when the peace-offering has come.'

Again there was a pause. All at once Helen pushed back her chair violently.

'Oh, if we could go!' she cried, her hands clasped, her eyes gleaming with excitement. 'Just for a week.' Then she checked herself, glancing half-shamefacedly at her mother.

Mary Campbell met the look with a strange smile.

'It would mean an awakening for you, child,' she said.

'A fine house, and horses and carriages—and Muirton Manse afterwards,' interrupted the minister dryly. 'How would that strike you?'

Helen turned indignantly on him.

'You know nothing would ever change my love for Muirton,' she exclaimed. 'But just for a week to see the town and the Assembly and Holyrood.'

'Ay, the Assembly,' echoed the minister in a reminiscent tone, not untinged with regret.

For many years now he had forgone the annual treat for economic reasons, putting by a little sum each year out of his narrow stipend until the time when the three would be able to enjoy the occasion in comfort. But this invitation had altered everything. It seemed to have opened out a whole vista of new possibilities in the future, the consequences of which might extend far beyond the one short week of the Assembly.

It was of Helen the minister and his wife were thinking, not of themselves. In each of their hearts was a lurking foreboding of what this crisis might mean for the girl. Yet would they be justified in depriving her of the opportunity it presented of seeing the other side of life? And there was their pride in her, too—the yearning to let those proud, aloof relatives see what a choice blossom they had reared in the simple north-country manse.

'I think,' said Mary Campbell softly at last—'I think we will just write to Aunt Charlotte and say yes.'

She was always the one to come first to a decision. It was just that vein of quiet strength in her nature that Helen had inherited, and that had kept the minister her slave through all these years.

He looked across the table at her now, a straight, long look.

'What three brave voyagers we shall be,' he said with a whimsical little laugh, 'setting forth on our adventures from the home-port!'

'It is only for a week,' interrupted Mary Campbell sharply.

'Father speaks as if we were never coming back,' said Helen in a gleeful tone. 'Why, the home-port will be all the nicer and more home-like when we do,' turning to him with a smile of supreme assurance.

'Of course, of course,' he agreed meekly. 'I was only'—— and he broke off, glancing at his wife.

But Mary Campbell's face was grave. This return to her own people meant something more for her than perhaps even her husband fully realised.

. . . . . .

It was a dark, drizzly evening when the travellers arrived at their destination a week later. Helen never forgot her first drive through the streets of the capital—the shining pavements, the brilliantly lighted shop-windows, the muffled-up pedestrians hurrying by, and above all the strange, tense silence of her mother that seemed to act like a stimulus to her own excitement.

Twenty years ago Mary Campbell had left those very streets behind her in defiance of the wishes of father and mother, preferring the love of the young assistant-minister she had chosen to be her husband. Now both parents were dead, and she was come to make her peace with her sole remaining relatives, her father's sisters, whose worldly counsels had, she believed, helped to embitter him against her. Little wonder that she was silent.

Helen had a vague perception of what she was feeling, but her own sensations were bewildering enough to engross her attention. By the time the great house in Moray Place was reached, and they had been ushered into the stately, luxuriously appointed drawing-room, she was almost too confused to reply to her aunts' greetings.

'So this is Helen!' said Miss Dalry Drummond, smiling into the girl's face with her hard, bright eyes.

She looked young to be the grandaunt of the tall, slim Amazon before her; but prosperity and a past blank of emotional experiences had combined to preserve her youth.

There was no attempt on her part to assume the rôle of affectionate relative or disguise her curiosity as to Helen's attractions; a candour for which, even in her bewildered state of mind, the girl allowed her aunt full credit.

It was very different with her younger aunt, Miss Effie, who rose from her chair and embraced her niece with nerveless effusiveness.

'My dear, what a great strong girl you are!' she said. 'I have been such an invalid all my life!'

One glance at her confirmed the statement, but a vague realisation of the egotistic devotion she had lavished on her own invalidism seemed to check Helen's sympathy.

The third occupant of the room, who had been standing before the fire, now came forward to greet the travellers.

Miss Drummond introduced him as 'Our cousin, Captain Napier.—I don't know whether your relationship would be recognised out of Scotland,' she added, turning to Helen.

But the young man laughed aside her scruples.

'What matter? We are on the right side of the Border, are we not, Cousin Helen?' he said. His blue eyes smiled into the girl's face as he bowed in mock solemnity over her hand.

All the charm and finish and bravery of him struck her full as she raised her eyes to his. He seemed the very personification of the heroic dreams of her girlhood. In a hardly articulate contrast, the other men she had known grouped themselves together in her consciousness—ministers of the neighbouring parishes, probationers who had sojourned at Muirton for a night, the local doctor with his familiar handshake and boisterous laugh.

This was the true moment of the awakening Mary Campbell had foreseen for her. All that happened subsequently belonged to the new chapter of her history that began then.

To judge by his enthusiastic comments when a few moments later the three had been carried off to their rooms by Miss Drummond, the young man had also found his new relative something of a revelation.

'You should have warned me, Cousin Effie,' he exclaimed reproachfully, returning to his place on the hearthrug. 'The girl is a beauty, and has a soul. Dress her in white satin, without diamonds, and'——

But a thin laugh from Miss Effie interrupted him. Her pale eyes were fixed innocently on his face, though there was a curious intensive gleam in them.

'My dear Archie, white satin in a manse!'

The young man scoffed.

'You don't suppose she is going to be buried in a manse all her life!'

'Well, in any case, no nonsense.' She lifted a reproving forefinger and shook it at him. 'As you are strong, be merciful. Remember she has never met men of our world before.'

'You forget my peril,' he retorted.

Yet, despite her warning, Archibald shamelessly exerted himself to entertain his new cousin during dinner.

Even in her simple, high-necked frock, Helen was fair enough to make the effort worth while, and a hint of deeper possibilities in her womanhood lent a subtle zest to their intercourse.

He could not help being flattered by the naïve interest she displayed in his military career. She plied him with questions as to the exploits of his regiment, the One Hundred and Seventy-eighth Highlanders, and never had the regimental history had a more sincere or enthusiastic listener. To be stationed at the Castle of Edinburgh, too, must surely be the very acme of his ambition. And when he muttered grumblingly of awkward stairs and uncomfortable quarters, she gazed at him with reproachful incredulity.

Before they parted that evening he had pledged himself to introduce her to some of the realities of a soldier's life, amongst which a personally conducted tour of the historic Edinburgh Castle was not the least attractive item.

The result of it all was that Helen's first night in the capital was a wakeful one, though her thoughts were pleasant enough to compensate for the lack of sleep.

Only one dread haunted her: the speedy termination of this week of enchantment. Six days, and then the home-port again. But already her whole thought of Muirton had changed. From Sunday to Sunday, what had her life been there? Could she ever be contented to go on in that easy, unthinking way again?

Downstairs, had she but known it, this very question of her future was being earnestly debated by her aunts. They had drawn their chairs in to the fire after their guests had retired, and were exchanging impressions of the evening.

'The girl Helen is a beauty,' said Miss Drummond, unconsciously echoing Archibald's words. 'I should like to have the shaping of her. A season in Edinburgh would'——

But her sister interrupted her with unusual vehemence.

'If you take my advice you will let her go back to her manse,' she said, drawing her fleecy shawl more closely about her as she spoke—'at least, until Archie is safely engaged or married to Lady Jean Dalrymple. I don't say there is any danger from this girl—he is too fastidious, too cultured, to care permanently for any but a woman of his own world; but he is impulsive, and, as you say, Helen is good-looking.'

Miss Drummond's bright eyes rested on her sister's face thoughtfully as she was speaking.

'She has more than beauty, I believe,' she said slowly at last.

'So Archie has discovered,' retorted the other: 'a temperament. Mary had one, and look where it landed her, in a draughty manse with a dreadful minister, no comforts, no society.' She shuddered delicately.

'Yet she is happy,' persisted Miss Drummond. 'I am thinking of ordering a white satin dress for Helen for the reception at Holyrood on Thursday,' she continued with apparent irrelevance.

But a little shriek from Miss Effie interrupted her.

'Charlotte, I beg of you not to be so foolish,' she cried, leaning forward and laying her fingers spasmodically on her sister's arm. Then she broke off with a little, nerveless laugh of apology. A recollection of Archie's face earlier in the evening as he had conjured up a vision of Helen in white satin, without diamonds, had presented itself to her, and her sister's suggestion only seemed to confirm the fears that had assailed her then. Her worldly, ambitious mind was set on a marriage between the young man and Jean Dalrymple, daughter of the Lord High Commissioner, and she had looked to this week of the Assembly to further her hopes.

'Well, I suppose you are right,' said Miss Drummond at last, with a little sigh. She would fain have startled Edinburgh society with this beautiful importation of her own flesh and blood, daughter of the manse though she was. But the unconscious tyranny of years was too strong to be lightly overthrown.

'I think so. I think you will be glad some day,' purred Miss Effie in a tone of relief.

*(To be continued.)*

# LONDON'S UNWANTED WOMEN.

## THE AUTHOR OF 'THE SOUL MARKET'S' PHILANTHROPIC SCHEME.

By Basil Tozer.

THERE are few conversations more instructive to listen to in these days of colossal fortunes and of most abject poverty than the talk that we hear about the unemployed, about underpaid labour, and about the starving thousands in our great cities.

It is instructive, one may term it even illuminating, because eight-tenths at least of the men and the women who express views upon these subjects with so much of self-assurance have but scant actual knowledge of the topics of which they speak.

Recently the writer, whilst dining at one of those houses where, in the accepted slang of the day, 'they do you thoroughly well,' was afforded an object-lesson which bears upon this point.

Sipping, after dinner, some old brandy which our host had incidentally declared cannot now be obtained for less than five pounds a bottle, a guest whose rent-roll is almost fabulous remarked concerning a topic that had just been broached, 'This talk about people starving in London and other big towns is exaggerated—grossly exaggerated. There must be destitution in a great city with a teeming population. There always has been, and there always will be. But I don't believe, and no one will ever convince me, that any sensible proportion of our population has literally nothing to eat. Somebody or other provides food—philanthropists, and so on.'

His opinion was not received with unqualified assent, for among the guests were some who had probed social problems, and who knew the speaker to be mistaken in the view he held. What he had said, however, he did honestly believe. But moving, as he always had done, in circles where the word 'poverty' is so often taken to mean that the individual spoken about has but a few hundreds a year to live upon, he found it impossible to grasp the word in its true meaning. Most likely he knew that there are people hidden away in unpleasant slums who often find it difficult to get a good meal; but if so, he probably argued that such people must in most instances have themselves to blame, up to a certain point, for their poverty; that their condition would have been less pitiful had they not been improvident, or addicted to insobriety, or perhaps even too lazy to work.

As for the women reduced to penury, 'You may depend upon it,' the same speaker observed some moments later, 'that women of that kind have for the most part been thriftless, or they have married without making due provision (!). I don't think I am hard-hearted'—emphatically he is not—'but I consider that we make too much fuss about the poor; we are becoming weak and sentimental as a nation.'

He wound the old brandy at five pounds a bottle round in the bottom of the big glass that held it, 'nosed' it, as the wine-merchants say, held it up in front of his eyes for a moment, then took a luxurious sip or two, rolling it about upon his tongue before swallowing it.

'Too good to be drunk,' was his verdict as he set the glass down again, and the writer could not help wondering what would become of this nectar of the gods if it were to be put aside and not 'drunk.' Presently conversation drifted to topics more congenial than talk about poverty and the poor. Indeed, so far as the speaker was concerned, the last word upon that question had been uttered.

And there are hundreds—thousands of men like that. Many of them are kind-hearted to a degree. They will give a sixpence to a plausible beggar in the streets; a shilling or even half a crown to a woman selling matches in the gutter, with a baby at her breast, if they happen to notice her, and she is miserable-looking enough to excite their momentary compassion; or a five-pound note to a friend who appeals on behalf of some 'deserving case.' Perhaps some of them will contribute from time to time fifty or a hundred pounds to a hospital or much-advertised philanthropic institution in need of funds.

Yet these rich men and rich women go through life to all intents with their eyes shut. They have never seen true misery, and as they would much sooner believe that it does not exist or that all that they have been told about it has been greatly exaggerated, they try to think that such is the case, and generally they succeed. And, as a natural result, the section of the community that has actually witnessed the horrors of the suffering amongst the very poor deem these rich men and rich women to be wholly callous. In reality their supposed callousness often is nothing more than

ignorance. Yet it is not, for that reason, necessarily excusable.

The writer has occasion to mix perhaps as largely with the poor, the real poor, the men and the women who literally don't know in the morning if during the day they will get anything to eat, or whether when the night comes on they will have a shelter of any kind, as he has with the people who own country houses and have stables full of hunters. The letters soliciting contributions for philanthropic objects which most of the latter receive day after day and week after week are in many instances so numerous that it is hardly to be wondered at that the majority of such appeals go unheeded; often the letters are tossed unread into the wastepaper-basket.

Of the appeals that are attended to it is safe to say that two-thirds come from men on behalf of men, on behalf of old men, of men out of employment, of men who have been incapacitated through accident or illness, of men who have families to support, of men who have been soldiers or sailors, and so on; the list is almost without end. This is remarkable in face of the fact that, considered as a whole, the poverty-stricken women of our cities by comparison suffer greater hardships than the men.

Spend a night in roaming the streets in the poorer districts of any big town, of London more especially, or even the back streets of the prosperous neighbourhoods, and the truth of this assertion will quickly become obvious. There are parts of London where within a few hundred yards of palatial hotels women and children may be found on any night starving—not starving in the sense that they feel that food would be most acceptable, but enduring torments such as no reader of this article can, one feels sure, ever have had the misfortune to experience, and of which he can have but the vaguest conception. Yet we hear little said about London's starving women and children by comparison with all that we hear and read about its starving men. This is due probably to the fact that the men are more often 'in the limelight of public compassion,' as an Irishman lately put it, than the women and the children are.

And let it be clearly understood that the women to whom reference is made now are neither the old nor the unsuccessful women of the streets, nor necessarily women who lack work. A considerable proportion are women who, earning a daily pittance, just enough, perhaps, to 'support' themselves and a child or two, are none the less homeless because they cannot afford a home. Their hours of toil over, they set to work to seek food, also some place to sleep in. When, as is often the case, they cannot afford both bread and shelter, they generally choose the former, though often it is but a mouthful. And it is not a little remarkable that no matter how famished a woman of this derelict class may be, she will invariably feed her child before considering her own hunger.

Ingenuous readers may ask, 'Why don't they go to the casual wards or to one of the common "kip" houses?' Often the nearest casual ward would be closed before they could reach it, while all who know of the treatment that is meted out at many of the casual wards to the outcasts who apply for admission will understand why it is that even these poor wretches prefer to crouch under archways and in dark corners, no matter how bitter the night. Of the lodging-houses accessible to outcast women of the class now being dealt with it is impossible to write in a journal which circulates in respectable homes. Particulars about them are given in Mrs Mary Higg's book, *Glimpses into the Abyss*, in Miss M. Loane's *The Next Street but One*, in Miss Olive Christian Malvery's *The Soul Market*, *Thirteen Nights*, and *Baby Toilers*, and in other works of the same kind; but even those ordinarily fearless writers have not dared to say all that they could have said, or they have been prevented by their publishers from doing so.

According to a parliamentary White Paper on this very subject, no less than forty-eight human beings, upon whom, in a single year, London coroners' juries returned verdicts, were declared to have died of starvation either directly or indirectly, and a great proportion of these unfortunates were women. As a newspaper, in commenting upon the report, truly observed, if the number of these cases dealt with annually were to be multiplied by ten, the total would still fall short of the number of derelict persons who die in any single year in London alone of hunger and of misery. Significant also in the report referred to is the fact that out of the forty-eight names that are mentioned, only one is not a British name. Seven of the victims were under forty years of age; twenty were over fifty; twenty-one were over sixty.

Most of us metaphorically shrug our shoulders when we read of horrors such as these, and declare, occasionally with a sigh, that, after all, nothing can be done to better the condition of such people. But, on the contrary, a great deal can be done, and much can be done now, especially in so far as the rescue of homeless, outcast, and starving women and children is concerned. The Duchess of Albany, the Duchess of St Albans, the Countess of Wemyss, Lady Brassey, Lady Dorothy Nevill, Lady Evelyn Moreton, Lady Wright, the Countess of Randor, Mrs Herbert Gladstone, Lord Strathcona, Lord Mountstephen, Lord Curzon, Lord Reay, Lord Llangattock, Lord Lansdowne, Mr Thomas Dence, Sir William Wright, Sir Dyce Duckworth, Sir W. S. Gilbert, and other well-known men and women of influence, stimulated in the first instance by the revelations made by Mrs Archibald Mackirdy (Olive Christian Malvery) in her terrible indictment, *The Soul Market*, have each not merely contributed towards the formation of a fund to establish close to Charing Cross a night-shelter where homeless women will be able to obtain wholesome food and a clean bed at from twopence to fourpence a

night, but in addition are personally interesting themselves in the scheme and doing all in their power to advance it.

Already a suitable building has been found. An additional and important feature of the scheme is that every attempt possible will be made to give to such women as are driven to seek relief an opportunity to improve their condition. For this purpose an employment bureau for women only is contemplated, its head office to be in the building where the women are to be sheltered; and so practical are all the arrangements in connection with the general management of the shelter that not a shilling will be wasted through careless administration or otherwise. Also, the refuge will be entirely self-supporting. The nominal charge to be made for admission and for food will place it within reach of the extremely poor, yet at the same time this charge will have the effect of keeping away habitually idle and improvident women who endeavour always to get food and shelter free of cost even when they have money to pay for it.

A final feature of the movement is that when the shelter has been equipped and opened no further call for contributions will be made, a feature which in itself will distinguish the new night-shelter from homes and institutions which—and they are all too numerous—are in the habit of repeatedly taxing the purses of their original patrons.

The number of poor working women and working girls who nightly are unable to find accommodation in London is very great, and some among them are gentlewomen reduced to extreme poverty through no fault of their own. During the bitterly cold nights of the past winter many of these women, some with children at their breasts, were to be seen huddled together on stone steps and in doorways, and beneath the arches near Charing Cross, in the vain hope of obtaining a little warmth by close contact one with another. There is a touch of irony in the coincidence that recently the writer of this paper should have been instructed by a daily journal to supply a descriptive account of the private banquet which was served in a great hotel at a tariff of sixty pounds per guest, and, on the same night, to write a report of the actual condition of the human wreckage that an hour after the banquet had ended was to be seen in a serried mass almost at the hotel's threshold, awaiting, with ghastly faces, charitable doles of food at a Salvation Army shelter.

We shall be told again that such contrasts must exist. They need not if men and women blessed with the world's wealth will emulate the example that has just been set by the philanthropists whose names are mentioned. And it is safe to say that if the money needed to set in motion the admirable scheme outlined above is forthcoming, no other night-shelter for women in London will be needed. The need will be covered absolutely. A little money, comparatively speaking, plenty of energy and determination, and unbounded enthusiasm, combined with careful organisation, and with business capacity in those responsible for the management of such refuges, together constitute all that is essential to raise hundreds upon hundreds of our fellow-creatures out of the condition of misery into which they have sunk—not all through lack of self-control or even of ability to succeed—and to restore their long-lost self-respect.

Above all, it should be remembered that this movement to help the starving women and girls of London which Mrs Mackirdy has initiated is prompted neither by sentimentalism nor by any ordinary feeling of philanthropy, but solely by the knowledge that the voice of humanity cries out for the abolition of such horrors among the people of a nation claiming to be civilised. As all know who have read her condemnatory exposure of the way in which the struggling poor of our great cities are compelled to live, all that she describes so faithfully and so vividly she herself has voluntarily endured—endured largely that she might be able to record in her books facts, and facts only.

How graphic and how powerful her narratives are may perhaps be inferred by some who have not read them, when it is stated that an individual whom the author has never seen has just sent her a cheque for a thousand guineas as a contribution to the fund for her proposed night-shelter for homeless and friendless women and girls, with this message: 'It is the perusal of your book, *The Soul Market*, that has prompted me to forward the enclosed contribution.'*

Statisticians assure us that they can produce figures to show how vast the sum of money is that is contributed annually for charitable objects by kind-hearted but indiscriminating persons, only to be frittered away upon superfluous expenditure in connection with mismanaged administration. Even the casual observer can hardly have failed to notice that in some of the cases that have come within the scope of his observation a sensible proportion of the sums of money intended by donors to be disbursed for charitable purposes is wasted unconscionably.

It may be untrue—concerning the accuracy of the statement the writer disclaims responsibility—but it is common talk among persons in a position to speak with authority that the survivors from the Messina earthquake derived no appreciable benefit from the immense sum that was subscribed for their relief. Careless or faulty administration, indeed, of charitable funds constitutes the canker of modern philanthropy, and is in a measure responsible for the reluctance sometimes displayed to contribute to public subscriptions. The writer could name several charitable organisations that today have elaborate premises in expensive thoroughfares, when a small office in a side street at a third or fourth of the rent would fulfil all requirements,

* As these pages are passing through the press, a further sum of one thousand pounds is contributed by a reader of Mrs Mackirdy's last book, *Thirteen Nights*.—B. T.

and that employ a large staff to do work which half the number of men and lads could get through if thoroughly efficient.

Then the amount of stationery that is wasted, the thousands of penny stamps that are used where halfpenny cards would suit the purpose as well or better, the all-round leakage through the succouring of persons who do not need help, the money that is squandered on office furniture and 'accessories,' the reckless employment of messengers, and the unnecessary sending of telegrams, all help to dissipate money that with careful management would find its way into channels leading to the immediate relief of the sufferers catered for by such societies.

Mention has been made that in the administration of the fund for the relief and betterment of the homeless women and girls—friendless for the most part, and keenly anxious to work—the strictest vigilance is to be observed in order to prevent leakage. Though the total sum wanted is ten thousand pounds, of which some three thousand has already been subscribed, the work of relief and of assistance will, as stated, be begun when a sum of six thousand pounds has been guaranteed. The Bishop of London is doing all he can to help; so is the Salvation Army; and so are other persons and communities of weight and influence. Should readers of this article feel moved to help so excellent and practical a scheme, sums sent to Mrs Mackirdy, Orchard Way, Hayward's Heath, will be acknowledged and at once forwarded to the organisers.

---

# LAURISTONS.

### CHAPTER XXXII.—HOW THEY SUFFERED ON THE SEA.

AUNT CHARLOTTE would, as we have said, have liked nothing better than to travel in a coach-and-six; but as that was out of the question, even if English horses had been permitted to land in France, they all went by stage to Dover, were all (except Sir Charles) very sick while crossing the Channel, and found it agreeable to their varied states of mind and body to rest for a day at Calais before attempting the remainder of the journey.

On shipboard Mistress Honeybun bewailed the day she was born, cried aloud to be put ashore in mid-Channel, and vowed herself to more charitable treatment of her fellows if only she were spared to set foot on land again.

Aunt Charlotte bore her eight hours of mortal agony with as little renunciation of what appeared to her the correct behaviour of a Marquise of France as the untowardness of circumstances permitted. Between her own paroxysms she was goaded, by the unbecoming violence of Honeybun's despair, to tell that forlorn damsel that she was a fool, and ought to be ashamed of herself. Honeybun was, however, past hearing anything but her own outcries, and so occupied with her own emotions as to be far past caring what any one else might think about her.

Mavie suffered in silence, her large eyes rounded with novel agonies; but for days afterwards, when safe on solid, dry land, she laughed quietly to herself at the ludicrous self-abandonments of the voyage.

M. de Montessonne and Etienne retired into dark corners and wrestled with their woes unseen. They were still pea-green, with bloodshot eyes, when they staggered ashore at Calais.

Sir Charles was the only one who ate a hearty meal at the inn that night. The journey seemed to have an excellent effect on his mind and spirits. One could almost have imagined him a schoolboy released from his bonds, or, say, a captive freed for a time from his prison-house. The rest waved away all invitations to food with gestures of abhorrence and despair.

The morning, however, found them recovered sufficiently to continue their journey. Sir Charles hired a roomy carriage with three horses, and thirty-six hours later they were thankfully at rest in the old house in the Faubourg St Germain which had seen the beginnings and endings of generations of Montessonnes from time immemorial.

Chiefly as a matter of precaution from a business point of view, and perhaps not entirely without consideration of the fact that Lauriston the banker might not be considered an altogether acceptable visitor by the First Consul, Sir Charles had had his own and Mavie's passports made out in his wife's name of Hamilton.

Mavie was delighted. It added just the necessary touch of secrecy and mystery to their expedition, and to be travelling as 'Mary Hamilton' invested their journey with something of the fragrance of her mother's gracious personality.

Nevertheless, within an hour of their setting foot in the Hôtel Montessonne there came a messenger with a letter from M. de Talleyrand, addressed indeed to 'Mr Hamilton,' but inviting 'Sir Charles Lauriston' to a private interview that same evening.

M. de Montessonne smiled at Sir Charles's questioning look at him.

'No,' he said quietly, 'I have never opened my lips. There is not much they don't know.'

And when, presently, Sir Charles met M. de Talleyrand in his private cabinet in his great house in the Rue St Dominique, and inquired how he had come to hear so speedily of his arrival, the Minister only smiled and said, 'It is our business, my dear sir, to know everything. Sometimes we know more about people than they actually know themselves,'

with a twinkle reminiscent of some of Fouché's mares' nests.

Thereupon they plunged at once into matters of business and of State, and were closeted together for a considerable time. For M. de Talleyrand, whom no man trusted completely, knew well whom he himself might trust; and when he had found such a one, and had proved him, he was quite ready to exploit for their mutual account the vast inside knowledge of affairs which he himself possessed.

'One does not live for nothing in these days,' he said with a smile which, like his remark, was open to various interpretations.

But to all Sir Charles's pertinent and anxious questions as to the future, his only reply, with a frankly puzzled face, which yet defied his visitor's efforts at penetration, was, 'We need peace, both he and the country. But he is a law unto himself, and he has an evil temper and so is unaccountable. If I see any signs of rupture, however, I promise you shall know in good time, my dear Sir Charles; in which case'—— And they settled their plans either for peace or for war.

Their colloquy was terminated suddenly by an urgent summons from the First Consul for M. de Talleyrand to attend him at the Tuileries.

The Minister sat up on his couch with a grimace of annoyance, and lifted his discrepant leg and heavy boot to the ground. 'He spares no one,' he said, 'nor himself. I was with him last night till he fell asleep in his chair. If I had done likewise, and he had wakened first, he would have sworn he had never closed an eye.' And Sir Charles was shown out by the small side door by which he had entered—a door which led into the garden of another house, and so at last by devious ways into a street. 'For,' said the Minister, 'the good Fouché has as many eyes as a fly, and his solicitude is inconvenient at times, even to his—h'm—friends.'

## CHAPTER XXXIII.—HOW THE TIGER PUT OUT HIS CLAWS.

MADAME LA MARQUISE was, not unnaturally, desirous of tasting to the full the sweets of her new estate with as little delay as was possible. M. de Montessonne was, indeed, under orders to reside in Paris for the present; but that did not preclude him from paying a short visit on occasion to one or other of his former country seats, even though, for the moment, he might but view them from the point of view of an interested spectator.

So, after a whole week in Paris—of ecstatic wonder and shuddering enjoyment on Mavie's part, of no little disillusionment on the part of Madame la Marquise, and of much critical observation and pungent criticism on the part of Sir Charles and the marquis—they took carriage again, travelling post as before, in accordance with monsieur's conviction as to the suitability of things, and rolled away past Fontainebleau into Burgundy.

Mortaigne, with its great castellated rock, and the broad river flowing below in dignified leisure, its clustered red-roofed houses and wide-stretching fields and vineyards, brought unction to Aunt Charlotte's soul. She was, indeed, somewhat put out at not being permitted to roll up to the great gates of the castle and enter into immediate possession.

'But,' as M. le Marquis quietly observed across his second best snuff-box, 'since there are no gates at present, and as everything else is in much the same condition, it will perhaps be more comfortable at the inn;' and to the sign of the 'Petit Caporal'—formerly the 'Roi Dagobert'—and the warm welcome which had suffered nothing from its change of name, they went.

'Ah, monsieur, but it is good for the eyes to see you once more!' said the landlord, bowing in the style of the times before the deluge. 'You return, then? We shall all be glad.'

'All in good time, my friend,' said the marquis. 'At present we come simply to see how you are getting on. As for the rest'—— A shrug and a flicker of the white hands left mine host to make what he could of it.

Nevertheless, and although as yet they claimed to be no more than visitors to the halls of the Montessonnes, the idea was abroad that the marquis was coming back to his own, and his old tenants from far and near came flocking in to greet him; while mine host, in the hope of the better times to come, spared neither himself nor his goods in his efforts on their behalf.

'Yes, *ma foi!* we shall all rejoice to see you up there in the old house again, monsieur,' said he with feeling.

'Ah, you find Liberty, Equality, Fraternity not so good for business as the former times, my good Berthelot?'

'Good! *Mon Dieu*, monsieur! in the old times one did occasionally get paid for one's trouble; but now—*eh bien*, now that we are all brothers—there is overmuch liberty and equality for my liking, and not nearly enough cash.'

'Ah, well, you can't have it every way, you know,' said the marquis, snuffing quizzically.

'For me, I am satisfied to revert to the former days.'

'I also,' said the marquis.

The château had suffered, like its neighbours, in the evil times, but it was still standing, which was more than could be said of some of the others; and as to the actual damage, there was nothing that money could not restore. The Montessonnes had always stood well with their tenants and neighbours. When the marquis eventually followed the remnants of royalty into exile his estates had been declared the property of the nation, and after the first ebullitions of republican fervour the nation saw to it that its property should not run absolutely to rack and ruin.

After careful inspection, the marquis, over a

thoughtful pinch of snuff, expressed the opinion that complete rehabilitation would cost not far short of a couple of hundred thousand francs, and that each of his other places would probably be in much the same condition.

'They must be put into proper order, of course,' said the marquise, with a quick look at Sir Charles. 'That is very different from throwing money away on—er'——

'Bourbons!' said the marquis with a nod.

'Or anything like that.—Charles, you will have to send us all we need as soon as you get back.'

'Certainly,' said Sir Charles.

'*Doucement! doucement!*' from the marquis. 'My dear, you hasten too quickly. We will at all events wait until M. the First Consul has fulfilled all his good promises. It is much to be back in France with an easy head on one's shoulders.—When the rest follows we will call upon you, Sir Charles.'

'When you will, my dear sir.'

'What happiness it is to have a brother-in-law possessed of pockets bottomless and a heart so good!'

'The pockets, at all events, are your wife's, my friend, and she has a right to do what she likes with their contents.'

They spent delightful days rambling over the old house and grounds, planning improvements they would make when the time came. And meanwhile Maître Berthelot made them so comfortable in the little inn by the water-side that Mavie for one would have been content to linger on there far past the allotted time.

She never forgot the little arbour where they had their meals. It was so like one of Mother Goose's little green houses in the cherry-orchard at Harrow. It was built on piles at the bottom of the garden, and through the open sides and the holes in the wooden floor you could see the cool gleam of the water as it hung about and loitered slowly past. An ancient vine had found the trellises to its liking, and had climbed in and out and all about it, until now it was all a leafy bower, with tiny green tassels hanging through the roof, and peeps through the thick green leaves of radiant blue-and-white sky up above to match the blue-and-white sky in the water below.

Sitting there, Mavie could imagine herself sitting in a green cloud between two blue-and-white skies. And then there were companies of birds which came and played and quarrelled just above your head, all too busy to give you a thought; and washerwomen away along the bank who laughed and chattered and paddled all day long. Oh, a delightful place! In the first joyous flush of foreign travel Mavie was ready to protest that there was no place in the world to equal this beautiful France. Time came, however, when she would willingly have given the whole of France for a very small portion of her native country—say about as much as is covered by an ordinary-sized bedroom.

For, as they sat merrily at breakfast in the vine-covered arbour one midday, there came to them along the white road the quick beat of a horse's feet; and scarcely had they stopped at the inn-door when down the garden came the rider, in haste and looking very soiled and dusty against the fresh green of the grass and the vines, and behind him the landlord, futile remonstrance in his every movement.

'But no! But no!' cried M. Berthelot; 'it is not decent to disturb gentlefolk at their breakfast. Just wait, my good fellow.'

But the other paid no more attention to him than might a hawk to the twittering of a sparrow. He came straight for the arbour, looked keenly at the merry party, then addressed himself without hesitation to Sir Charles.

'Monsieur Hamilton!' he said, and handed him a letter superscribed simply, 'Without delay.'

With a word of apology, Sir Charles broke the seal and read: 'Follow bearer without a moment's delay.'

There was neither address nor signature, but the writing was signature enough. It was Talleyrand's, and he rose at once. The times and the man were such as demanded instant compliance with so imperative a request.

Sir Charles nodded to the messenger, who stood switching his dusty boot with his whip.

'When did you leave?' he asked.

'An hour before sunrise, monsieur.'

'You have not loitered.'

'One does not loiter on monsieur's errands, monsieur.'

'Maître Berthelot,' said Sir Charles, 'furnish monsieur with all he desires, and have your two best horses at the door in ten minutes.' And when they had disappeared into the inn he briefly explained to the others, 'Talleyrand wants me without delay. There is evidently something up.—Mavie, my dear, you will amuse yourself here till I return for you.'

'Yes, father,' said Mavie solemnly.

'We will take all care of her,' said M. de Montessonne.

'Dear! dear!' said Aunt Charlotte; 'what a world it is! You never know one moment what the next may bring! I suppose you must go, Charles?'

'Evidently, my dear. M. de Talleyrand does not send special messengers one hundred miles without reason. Go on with your breakfast, all of you, I beg. I will get one or two things I may need. There is no reason why you should spoil your meal.' And he went away into the inn, where he found M. de Talleyrand's messenger laying in provisions after the manner of one used to taking advantage of his opportunities.

'Where to—Paris?' he asked, as they set off at a smart trot along the high-road, after hurried farewells.

'No, monsieur. By Montargis and Étampes to Rambouillet. Monsieur expects us there before midnight.'

'You will be a weary man by the time we get there, my friend.'

'I am used to it, monsieur. I spend my life in the saddle.'

'Then I shall probably be the more weary of the two.'

'Without doubt, monsieur;' and then he relapsed into silence, and Sir Charles gave himself up to consideration of what he might be hastening to. There was business of moment afoot without doubt, and his mind ran rapidly along the lines of various possibilities and the best means of turning them to account.

Three times during the afternoon and evening they changed horses, and rode into the courtyard of the 'Lion d'Or,' on the outskirts of Rambouillet, soon after ten o'clock.

'Monsieur awaits you,' said the landlord, as Sir Charles got stiffly down, limp in the back and with legs that felt as though they had been amputated at the hips and badly joined on again.

M. de Talleyrand was lying on a couch before a well-spread table and a large fire, in a room upstairs. He stretched a welcoming white hand.

'This is well!' he said softly. 'The earlier you have arrived the sooner you can go. Eat, my friend; eat! Time is of consequence.'

'Ah, and where do I go next?' asked Sir Charles, chafing his hips tenderly as he sat down at the table.

'To England, my friend'——

'To England!'

'Without any more delay than will fit you for the saddle again.'

'My legs feel as though they belonged to some one else as it is. However! It is, then'——

'Yes, war,' nodded Talleyrand. 'And not only that, but if you don't get across within the next twelve hours the chances are you won't get across at all. Hence the urgency of my message, which, under the circumstances, I am sure you will pardon.'

'Oh, ho!'

'Yes, he has got a fit of the spleen, and is going to seize every Englishman he can lay hands on.'

'That is simply infamous!'

'That does not trouble him,' said the Minister with a shrug. 'Such of your countrymen as are well advised will benefit by the fact that it seemed to me that Sir Charles Lauriston would be more useful to himself—and incidentally to me—in London than in France during the next few months.'

'He is mad!'

'Splenetic,' smiled Talleyrand. 'The decree will be issued to-morrow, by which time I hope you will be well beyond reach.'

'What about my daughter? She is with the Montessonnes at Mortaigne.'

'She will be perfectly safe with them. We will see to her getting home all right. But the first thing is to get you there safely.'

Lauriston nodded, with a grim, fleeting thought of the havoc his detention would bring about should he not get safely home.

'I will write a few lines to her. Perhaps you will'——

'I will see it delivered.'

'How do I go?'

'By Dreux and Bernay and Lisieux to Honfleur. My trusty Jean-Marie, who brought you here, will put you into the hands of a man who will take you across—an excellent man, a most distinguished free-trader. If there should be any difficulty there—one never knows in the free-trading business—Jean-Marie will take you on to Coutances, and you will get across to Jersey. But that means delay, and we have not a minute to spare. The decree will be published in every port to-morrow, and the doors will be locked tight.'

'I am greatly indebted to you'——

'You will liquidate the debt.' And they fell to discussion of the immediate future and its mighty possibilities.

Before midnight the travellers were pounding away on the road to Honfleur and freedom; and M. de Talleyrand, rolling back to Paris in his comfortable berline, congratulated himself on the good stroke of business which, while repaying past courtesies, could not fail to bring grist to his mill.

And Charles Lauriston rode silently by the side of Jean-Marie, and brooded on the narrowness of the bounds within which human affairs are set, especially the affairs of those who have wilfully taken the irrevocable step across that inflexible line of honour which has set man in camps since the days of Cain.

It was bitterness to him—bitterness! bitterness! But he set his teeth and vowed himself to the sacrifice as he had done so often before. If only he could pull through and avert the catastrophe, how willingly he would pay the price—so long as the payment was confined to himself!

*(To be continued.)*

# THE MARSH.

By W. A. DUTT.

THERE is a Norman church on the verge of the uplands, and from the top of the massive church-tower many miles of wide-spreading marsh lie revealed. Through the midst of it the reed-fringed river winds sluggishly, and trending towards the river are innumerable clear-water or sedgy dikes; but the river, the dikes, and the rough trackways or 'walls' along which the cattle are driven scarcely relieve the apparent monotony of the far-reaching marish plain. A thousand years, in all probability, covers the period of its existence as a tract of fen and marsh, yet it has every appearance of being unaltered since those primitive times when many of the inhabitants of England were lake-dwellers, and the wolf, the elk, and the great wild ox roamed in English forests and over English moors. The scattered windmills, the reed-thatched cattle-sheds, the isolated, low-walled cottages of the marshmen, and even the two or three churches standing on the marsh level are, when seen from the church-tower, dwarfed to insignificance by its formal flatness, the impressiveness of which is emphasised by the vast expanse of aerial void beneath which it lies supine. In a thousand years man has been able to make little mark upon it, and such small signs of his handiwork as appear on its surface have become so blended with it as to be almost indistinguishable. Just as a level prairie by its vastness hides the pioneer's camp or settlement in its midst, so the marsh conceals its few human inhabitants and their lonesome homes. In the midst of its rush-beds, sallow carrs, and dwarf thickets of bog-myrtle, they are scarcely more noticeable than the otters and moorhens that skulk amid the river-side reeds. The marish wilderness seems to permit their presence with a serene indifference, and when floods transform the marsh into a waste of waters the tenure by which the marsh-folk hold their little settlements seems as insecure as that of a sand-castle threatened by the sea.

Yet from time immemorial the marsh has had its human inhabitants, and they have adapted themselves to the primitive life it compels them to lead. Like the otters and moorhens, they have become a part of it; the spell it casts upon them is so subtle that they do not feel it. As the heathman clings to the heath, and the woodman to the wood, so the marshman clings to the marsh, and cannot tell why he does so. Although he does not know it, the marsh is stronger than he; while he thinks it is his, it possesses him. Therefore it is useless to go to the marshman to learn the magic of the marsh and the secret of the charm it has for many men who go to it seeking some one thing and some another, and all finding more than they sought. That magic, that charm, pervades the whole wide level; but as to what goes to its making no two men are agreed. One thinks he finds it lurking in the sweet gale, where it takes the form of a little brown warbler that chuckles day and night; another, in the fleecy tufts of cotton-grass waving over the rush-marsh; and a third, in the sibilant voice of the reeds sighing forlornly in solitary places; but a hundred other things present themselves to the wanderer 'in reedy fens wide-spread and marshes drear,' and each has a share in creating a powerful yet indefinable fascination. The desolateness of the desert, the sterility of the snow-mantled steppe, or the sublimity of the sea makes upon a sensitive mind a like impression, mysterious and incommunicable.

The marsh has many moods, and to appreciate them one must go down into it by night as well as by day, and subject one's self to its influences. Throughout the winter there are scarcely two days on which it wears the same aspect, so easily does it adapt itself to elemental changes. Overshadowed by lowering clouds, it is sombre and dreary, its reeds sigh mournfully, and its sedges shiver in the chill wind; but when the sunlight breaks through the clouds the wide tracts of sapless reed and sedge seem to borrow the gold and amber of autumn corn-fields. Presently an almost transparent mist veils it, softening its hard outlines and blending land and water until they seem one vast mirage which at any moment may melt into thin air; and towards evening, perhaps, the mist is succeeded by a fog so dense that the wide level looks like a shoreless sea.

During the night a sea-wind sweeps across the marsh, driving the fog before it, and by the time the gray dawn has brightened into rose and gold the frost has worked wonders in reed-bed, rush-marsh, and dike by transforming every ruddy dock-leaf into a silver shield, and every sedge-blade and needle-pointed rush into a jewelled sword or lance fit for the armoury of a fairy king. By every shred of the wind-rent reed-tassels ice-beads are suspended which flash like diamonds in the light of the rising sun, and where in the night the wind sang a sibilant song or moaned in mournful monotone thousands of gleaming ice-crystals are tinkling like tiny bells. Bushes of sweet gale, thickets of sallow, and rows of rugged alders, which the frost found drenched with mist-drops, are now dusted with flawless gems; festoons of crystalline lacework are hung about the withered stems of the marsh-thistles; and every dead leaf is covered with the richest filigrane. In an hour or two the sombre marsh has been decked with magic beauty, clothed with a garment of exquisite loveliness, compared with which its ordinary winter vesture, rich though

it is in brilliant hues, seems dingy as a beggar's rags.

As time goes on, and the stagnation of winter is slowly succeeded by the pageant of spring, subtle changes take place in dike-bed, marsh, and reed-shoal, which gradually bring about a general renewal of vigorous life where for months there has been no sign of vitality. On the uplands the brown buds are turning green before the results of these changes are seen in the marsh; but by the time the first willow-warbler has come back to the sallow thicket, and the first grasshopper-warbler has trilled its metallic song among the bog-myrtles, pale-green sprays of bog-pimpernel have begun to spread over the richly coloured mosses of the rush-marsh, a few marsh-violets have bloomed on the sunny side of an alder carr, and the golden blossoms of the marsh-marigold have brightened the banks of the dikes.

When the chattering songs of the sedge and reed warblers are heard again, a slowly widening band of green along the bottom of the amber reed-bed means that the 'colts,' as the marshmen call the young reeds, are springing up amid last year's dry and brittle culms; while the drumming of the snipe, the piping of the redshank, and the return of the wailing lapwing to its nesting-place are signs that the marsh will soon be dry enough for the cattle to be driven down to it again. All day long the kestrel — the marshman's 'wind-fanner' — circles and hovers over the lush grass amid which innumerable field-mice are beginning to creep; and in the dusk of evening the bat, 'that is the slave of dim Persephone,' wheels 'through the sombre air on wandering wing,' and the nightjar comes out of the marsh-bordering wood and glides up and down above the dikes, seeking the white moths amid the waving reeds. After the long winter sleep the wild life of the marsh seems to need no night rest; for all night long the sedge and reed warblers keep on singing and the plovers crying, while the trilling of the little natterjack toads makes the air tremulously vibrant, as though a faun had strung a harp with the stems of the quivering reeds.

Imperceptibly the seedling spring attains the lusty maturity of summer, and the marsh, decked with the rich purple of wild orchis and the shimmering gold of crowfoot and spearwort, lies bathed in warm sunshine, while red, blue, and yellow-banded dragon-flies, brilliant as tropical hummingbirds, flash to and fro over sedgy swamp and marish pool. In the early morning the grass and creamy masses of almond-scented meadow-sweet are so wet with dew that the men who mow the lush marsh-crop are drenched with it long before breakfast-time; but at midday a translucent heat-haze hangs over the whole level and flows above it like an aerial stream. Just such a diaphanous veil might a beautiful woman wear who knew that it made her beauty more alluring; and the wild marsh, flaunting a floral wealth with which not even the heather-empurpled moorland can compare, shows an alluring face through the 'ethereal gauze.' At daybreak the lark and the meadow-pipit soar and sing high above the rolling waves of gray-green grass; but at drowsy noon the marsh-birds are silent, save for the occasional feeble twitter of a reed-bunting or the harsh cry of a heron flying lazily towards some distant dike.

When a breeze blows coolly from the sea the lisping willow-leaves show their silvery undersides, and the downy tufts of cotton-grass float to and fro on the surface of the quaking swamp. During the sunniest hours swallow-tail butterflies flutter hither and thither, looking like wind-blown autumn leaves, day-flying burnet moths wrap themselves round with a film of invisibly beating wings, and the vampire marsh-flies hover everywhere, bent on tormenting man and beast. Amid the rank-growing willow-herbs, purple and yellow loosestrife, and towering valerians one walks as through a jungle, and the air is sickly-sweet with the overpowering fragrance of meadow-sweet and mint.

---

# A ROMANCE OF THE READING-ROOM.

By F. G. Aflalo.

KENDAL TRELEVAN loved books for what was in them. They were at once his livelihood and his joy. He was no connoisseur of rare editions. He was no thrall to the Elzevir. He did not like poor stuff the better for trappings of tooled morocco. His true home was the Reading-Room of the British Museum, where he felt himself the possessor of as fine a library as the heart could desire. True, there were only a few thousand volumes that he could take down from the shelves; but there were stacks of books within reach, and with only the formality of scribbling his behests on slips of paper, putting these in a basket, and waiting until willing minions did his bidding. And then he shared with Thackeray the glorious birthright of picking the brains crystallised on those shelves. These roseate thoughts, it is true, only came to him now, in the days of his success, with a steadily increasing income and the friendship of august editors, with his name in men's mouths and their gold in his pockets. Time had been when, just down from Cambridge, the round room had looked unfriendly to his nervous eye.

Five years ago, having taken a respectable but not brilliant degree at Trinity, he had journeyed to London and set his foot on a low rung of the

literary ladder, setting out for such adventure as might befall on the main of journalism, that Sargasso Sea of intelligent flotsam. Journalism is not, like plumbing or tailoring, a trade that can be taught. Trelevan brought to it a little scholarship, a passion for observing, a sunny temperament that could smile under disappointments that might well have depressed Ariel, and a letter from a Fellow of his college to the editor of a serious review. There is a cant that introductions are worthless nowadays, and that the prizes go to merit, irrespective of influence. Pish! The don's letter, just at the start of his career, was worth more to Kendal than his degree. Not his first effort—not, for the matter of that, his second—pleased the great man, for the review was run not for profit but as the hobby of a dilettante millionaire, and the editor could afford to be fastidious. But it may safely be asserted that without that letter on the familiar old college paper, written by a man of his own year in whose judgment the editor had nearly as blind a faith as in his own, the second would not even have been read, and the third would as surely not have been published. It was on a somewhat recondite subject—to wit, 'Phœnician Evidences in Cornish Folklore,' and it enriched the author by a cheque for fifteen guineas and a copy of the review. Seeing that it had taken him a month at the Reading-Room to collect the material, and two journeys down to Cambridge to consult with his tutor on obscure points in the argument, it could hardly be regarded as a gold-mine. But it was the first; and, as he sent the review straightway to his widowed mother in the duchy (and bought another), he knew that that article would always mean more to him than any other until he crossed the Ferry.

Kendal Trelevan, who was free from the fudge of art for art's sake, giving only of his best, but thinking himself worthy of his hire, was not long in realising that the world does not want to read very much or very often about the part played by the Carthaginian adventurers in the stories of giants and pixies that were among the earliest memories of his childhood. So he began to send forth lighter and shorter essays to more ephemeral prints. At first they came back so uniformly, indeed, that he was glad that he had adopted the fictitious name of 'J. Menheniot,' even though it temporarily discredited him with his landlady, whose suspicions of a lodger with 'them alibis,' had to be allayed by consultation with a newsvendor in the neighbouring court, who set her fears at rest, having fortunately some knowledge of these matters.

Suddenly, and, as it seemed, for no particular reason, the tide turned. A turnover, descriptive of the little harbour near his home, was accepted by an evening paper which has long made a feature of such essays. A letter to an august morning paper on a popular error with regard to undergraduate life at Cambridge brought him, in his own name, a letter from the editor of another daily with a mammoth circulation, which had results. So far he had obtained work only by the recognised process of pelting editors broadcast with contributions and enclosing a stamped envelope, of which few omitted to avail themselves, his only originality consisting in never sending an accompanying letter, since, he argued, if the articles did not speak for themselves it was not likely that recommendation from their author could do any good. Then he had tried an experiment, and it met with quite unexpected success at the hands of the most original editor in London. He purchased one or two books on the day of publication, and sent in short reviews of them in his best style, just as he sent other articles. For a fortnight there was no response to this daring bid for admission to the closed borough of reviewers; then came a parcel of books from a daily, and almost ever since he had had as many for review as he could do with.

Here, then, with this somewhat lengthy introduction, necessary to understand how he fitted his environment, we have Kendal Trelevan, aged six-and-twenty, earning a comfortable income for a bachelor of booky tastes, and living in a south-eastern suburb within an hour's rail of town. The suburb irked him, but he preferred it to the smirch of London lodgings, which he had thrown off at the first opportunity. Above all, he would have liked to live away in the country, for choice in an old farmhouse of his memories, with the roar of the Atlantic in his ears. Over his discoloured old pipe he would dream in the evenings of a luxurious future in which he should be free from the trammels of daily journalism, and able to write his books two hundred miles from Paddington. But he realised the need of 'keeping in touch' for a long time yet, and he was happy enough in the tiny garden attached to the little house of the naval pensioner's widow with whom he lodged. It was a common enough little garden, with the pink blossom straggling over the low wall to mingle with the white blossom next door; but he was not discontented as he sprawled this warm May evening over its little patch of grass, his attention distracted by the screaming swifts from the pages of a little volume that he had to appraise by that night's post.

In his heart he hated Suburbia as neither fish nor flesh nor good red herring. He knew that it lacked the privacy that had been his amid the five million souls of London, and that it also missed the glorious space of the country. The walls of its terrace-houses are too thin, and the walls of their gardens are too low. Every one is interested in every one else; and he reflected with amusement that the suburban definition of hell would probably be a place in which every woman had to mind her own business. He was at a loss to know whether there was more pathos in the terraces of red-brick houses, each with its little white porch, or in the

select 'villa residences,' each enisled in its planted jungle of three acres (leasehold), where it could shrink from the vulgar gaze of the semi-detached. Kendal shuddered whenever his surroundings struck him in this light.

Meanwhile he shut his eyes to the worst side of Philistia, breathed the pure air of the Surrey hills, paid his landlady regularly, and gave packets of chocolate to her little daughter, who occasionally fetched him matches or came into the garden to announce a meal. He had no friends in the neighbourhood. His only social distraction was an occasional dinner or lawn-tennis party at the house of one of his editors, who lived in Holland Park. The lady of the house affected Browning and green velvet dinner-gowns cut square at the throat. The daughter, brutally scornful of literature, was a notable swimmer and fencer, and a pillar of the Bath Club. She had at first been attracted by the good-looking young Cornishman, and had not taken the trouble to conceal her opinion. He had the black hair and olive complexion not uncommon in the duchy, and referred by those who are fond of making zoological catalogues of their kind to the influence of the Spanish Armada. Frankly, the Amazon did not find him receptive, though he was careful to stand well with the only child of one who just then swayed his destinies; but she fortunately transferred her preference to a man in the Colonial Office, a red-necked giant who had rowed in the Oxford boat, so that he was spared repelling advances which had at one time threatened embarrassment.

He was thinking this May evening of many things, for he had to think of something till the last post came. That last post meant so much to-night. He was thinking, not inappropriately, how very little the *ewig weibliche* had counted for in his life. He was no woman-hater; but, on the one hand, he had lacked opportunity of meeting many women of his own class, so that 'her infinite variety' had never tried his judgment, and from the lighter women of the town a certain fastidiousness had always kept him aloof. There had been one promise of episode, soon after he arrived in London; but it was years ago, and it had left him cold. In those early days he had satisfied his midday appetite with a frugal lunch of tea and a poached egg, or scones and cocoa, at one of those A.B.C. establishments which, for a more anæmic generation, now replace the dim old taverns loved by Dr Johnson and the men who were men indeed. It was at one of these eating-houses in Oxford Street that a little, blue-eyed, fair-haired waitress, to one of whose tables he had by chance gone on the occasion of his first visit, had mothered him, day after day, for nearly two months, seeing that his modest requirements were satisfied with the least possible delay, bringing him the day's paper, and even, in flagrant defiance of regulations framed to frustrate such essays in natural selection, lingering at his table for a chat until the impatient summons of some neglected patron broke in on their intercourse. Each learnt the other's name. Hers was Trissie Butler. He recalled it this evening, with quaint memory of Swinburne's lines:

> And the best and the worst of this is,
> That neither is most to blame
> If you've forgotten my kisses,
> And I've forgotten your name.

There had been no kisses. That was the curious part of it. Miss Butler was probably the prettiest waitress in the employ of the A.B.C.—which is saying a good deal for her. She did not drop her aspirates; on the contrary, she laid a stress on them which suggested ownership. The affair promised to develop into the ordinary flirtation between a man newly down from Cambridge and the young lady who served his meals. Then, one fatal day in May, he had offered to take her down to Richmond the following Sunday, and she duly turned up on the platform at Waterloo in a bewitching up-river costume that had cost her a night's rest in the stitching. His intentions towards this most attractive Hebe were not particularly clear to himself; but they could only have been—well, what they could only have been! But a word from her, which, had she known the cold douche it sent over him, she had rather bitten out her tongue than uttered, saved both of them. They had wandered in the park, and they were drifting on the river; and, just as the little boat pushed its pointed, varnished nose into a clump of reeds and came to rest, she had suddenly leant forward and stroked his dark, curly hair, and called him 'Kid'! Kid! It jarred on some queer artistic instinct in him, and he drew back as if he had been struck. They got through the rest of the evening as best they could, and by eleven he was back in his Edgware Road lodging, reading Marcus Aurelius; and she, poor commonplace little soul, who knew that things had gone wrong, and could not understand why, was sobbing on her hard little bed a mile away. He never went to that A.B.C. shop again; for two months he never even passed the door. Yet it pleased him to remember that the adventure had left her unscathed; and the next, and last, time he had seen her, at one of the Exhibitions, she was tripping merrily between rival swains of her own class.

And now, after four years, the One Woman had come into his Eden, and the days of Kendal Trelevan, bachelor, would be numbered if only the postman—— It had all been so simple, so unavoidable, so compelling. For several weeks he had employed a 'ghost' in connection with those portions of a county history of Cornwall for which he was responsible. Graham Baily was a delicate-looking enthusiast, a man of something short of fifty, recommended to him by one of the Reading-Room assistants, who are, as well they should be, perfect mines of information on the highways and byways of research-work. Graham Baily was one of

life's failures; why, he did not even know himself. He had taken his degree in prehistoric times; he had average intelligence and more than average application. He did not drink and he did not gamble. But he had two enemies: a lack of initiative and a sympathetic heart; and so, unable to make work for himself, unwilling to take bread from the mouths of others, he stood for a pathetic failure. Years of devilling, giving him the continuous impression that he was really some one else, had endowed him with a ghost-like tread and silent manner, and he had been one of the set-pieces of the Reading-Room for a quarter of a century. Of his domestic affairs no one knew anything. He came each morning at nine; he left each evening at six; and his address, known to the friendly official who got him many a job, was somewhere Brixton way.

The manorial and parochial notes for the county history were nearing completion, and Kendal, who had taken a great fancy to this sad ally of his, who did so much work and reaped so little reward, was already planning another book on which to employ him. Every day, just before lunch, he went round to the Museum, and always the thin, bent figure was there at I 16 or 17, with the two piles of books and the scattered sheets covered with the small, neat writing. Occasionally he would carry the man off to lunch, almost against his will; but more than once he had point-blank refused, held by an unusually interesting piece of copying that nothing would induce him to leave.

One morning, nearly two months ago, Kendal had gone, as usual, to the Reading-Room, and even as he pushed open the swing-doors he was aware of a difference. A glance at I 16 explained the reason of his curious sensation of something amiss. For the seat was occupied by a slip of a girl with a tilted hat and a goose-feather stuck askew in it; the next seat was empty, and at the next sat a youth in a check suit, who seemed to find a side-long view of the girl more interesting than the open book on his desk. So Baily evidently hadn't turned up! He hoped the poor chap was all right, though he had been looking confoundedly ill the last few days. So Kendal strolled towards the middle of the room, hesitating whether to have the books out—no doubt they would be waiting at Bar A—for an hour, and work at them himself, as the day for going to press was getting near; and as he passed behind I 16 his eyes fell mechanically on the books at which this industrious maiden was at work. He rubbed his eyes to make sure that he was not dreaming. No, they were the same Cornish archives from which Baily should have been extracting the material for the last of his chapters. Then he sat down in the vacant chair, to the intense annoyance of the round-faced youth on the farther side, who, his view of beauty thus rudely intercepted by this boorish intruder, had now no choice but to apply himself to Yves Guyot's *Comédie Protectionniste*, from which he hoped to 'borrow' ideas for an inflammatory article to appear in a Radical paper which was just then making hash of Tariff Reform and throwing dukes wholesale to the lions. Then Kendal looked furtively at the fair usurper of poor Baily's chair, and saw that, in profile at any rate, she was very good to look upon. Then he coughed so loudly and so artificially that she looked round, and as their eyes met he saw that she was even better to look upon than at the first inspection. But he saw something else. Baily had always struck him, with his high white forehead and ascetic expression, as the remains of what must have been a handsome youth; here was the same beauty, its severity softened; and in a flash Kendal saw it all.

'I beg your pardon,' he said in the decorous whisper enjoined under that august dome; 'but I think that you must be here for Mr Baily. I—my name is Trelevan.'

She smiled charmingly.

'Yes,' she said. 'I am Mr Baily's daughter. He—here is a note for you, which will explain. I am sorry to say he was too ill to come this morning, and I am quite used to this sort of work, and—— Oh, I hope I am getting on with it all right!'

The note remained unopened. Trelevan, the austere, the fastidious, preferred to read the message flashed by those gray eyes.

'Shall we go outside and talk?' he suggested, as one or two angry hisses, uttered by literary ladies with whom no man could have desired to talk these forty years, interrupted their conversation. 'You needn't be afraid,' he added, seeing her hesitate; 'the books will be all right here. Yes, I shouldn't leave the muff.'

And she had taken up the little sable muff, stuffing a tiny handkerchief away into some mysterious recess in its side, and had walked with him through the glass doors, where they would have no further need to talk like frightened children.

'I hope that your father isn't very bad?' he asked kindly.

'Well, I'm afraid'—— There was a little catch in her voice. 'He was coughing dreadfully in the night, and the doctor said that he must not leave the house again this week anyway. But won't you read the letter?'

He did. It was written in pencil, painfully, in bed, the message of a sick man and a brave, apologising for his weakness, and hoping that his daughter, who was used to secretarial work and punctilious accuracy, would be able to take his place for a few days.

'That's all right,' he said when he had put the letter in his pocket. 'And he is quite cheerful, and we'll have him about again in no time. And now, Miss Baily, as I am quite an old friend of your father's—at least, I hope he regards me as one—will you do me the favour of coming out to

lunch with me? And then you shall go back to your work.'

Clarice Baily was no prude, though even a prude would have trusted herself with this gentlemanly boy.

They lunched at the Holborn Restaurant, and she told him of her last employment as secretary to a lady engaged in charitable work; but skimmed lightly over the manner of her losing it, only suggesting enough to show Kendal that the lady's brother, home on leave from India, had indulged chiefly in the charity which begins and ends at home, and had attempted to take charge of Miss Baily's leisure in a manner that she could not but resent.

Lunch over, they returned to the Museum, but not, alas! to work, for they wandered in the echoing halls amid the grim old statues that have looked down on many an idyl in the making; and the time passed so quickly that the books had to be put away for the next day, and they went together as far as Victoria, where separate trains were waiting for them.

Next morning, and for several mornings after, as the invalid did not mend so rapidly as he had hoped, he found her at her post, sometimes getting her to come out to lunch, once or twice excusing her, as she was anxious to finish a section and get back to relieve her mother in the sickroom. Then he had made her promise not to come the next day at all, and—unselfish fellow!—had even asked whether she thought that her father would care to see him. So he had gone down to the little house in Brixton, and sat with the convalescent, and again on the Sunday, and then he stayed to supper. The next time he met her at the Museum she told him, not without regret in her voice, that she would be coming no more, as her father was out for the first time that morning, and would resume his duties with what little remained of the work. Then, metaphorically digging himself in the ribs over his diplomacy, Kendal had asked whether, since she was so good at the work, she would not like regular employment of the kind for herself as well, as he could easily find it for her straightway. And the glorious gray eyes had shone with gratitude. It had, as he said, been easy to provide research-work for her, and he was sensible enough not to offer excessive remuneration, lest she might be offended as by charity.

This May evening, as he sat in his little, common suburban garden, he knew that the postman, surely due by now, might make of it an Eden in which the sparrows would be humming-birds and the starlings birds of Paradise, for he had sent a manuscript that day which meant more to him than all he had ever written or would ever write. This singular fellow had written to Clarice asking her to be his wife. Had he mixed with women like any normal man he would have asked point-blank for what he wanted, or rather he would have trifled longer with the delicious uncertainty of desires unsatisfied. But he could not wait, and he disliked giving her the pain of refusing him in so many words. So he had written a straightforward letter, and had sent his prayer to the Reading-Room. It seemed fitting that she should give her answer there, and he had a vague hope that the scene of their first meeting might somehow plead for him.

The postman's knock sounded up the little street, and Kendal met him at the gate. There were four letters for him, three from editors whose goodwill would once on a time have made him delirious. He thrust these carelessly into his pocket, and tore open the little white envelope addressed in the spidery characters of the modern girl armed with a J nib. There was only a little scrap of paper torn from her foolscap, and the writing was on both sides. And this was the writing:

'DEAR KENDAL,—I have just read your letter six times, and I am going to read it six times more. No, sir'——

Here he had to turn the page, and the whole world seemed to go dark. Then all was light again, for the letter went on:

—'you are *not* the happiest person on earth at all. Of course it is YES!—Your own

'CLARICE.

'*P.S.*—You old coward!'

## UNDER THE SOUTHERN CROSS.

HERE, where the moonflower scents the midnight air,
And alien stars set all the world aflame,
Voices from oversea call to our hearts
That exile cannot tame.

For we have other memories—you and I—
All unforgotten in this southern blaze,
That tell of nesting birds and hawthorn-buds,
And England's cloudy days.

They haunt us still, those dreams from oversea—
The talk of rooks among the wind-swept trees,
The flushing white of loosened apple-bloom,
On a light April breeze.

The fading woods, and silent, late-reaped fields,
The wild, wet winds chasing the light-winged leaves,
The twilight gathering slowly into gloom
About the ripened sheaves.

Wide, unforgotten moorland stretches spread
Where purple heather fades to golden brown,
And silence broods about the lonely loch
Under the mountain's frown.

Then slowly rises 'mid these southern stars
The harvest moon—a reddening globe of flame—
And on the scented air an echo falls
Of some sad, haunting name.

# MY WILD-FLOWER WALKS.

By COULSON KERNAHAN.

I.

THERE are few lovelier sights on a breezy summer morning than isolated and closely set clusters of dandelions—tiny 'Canary Islands' rising out of great seas of grass that roll and break in mimic waves upon a yellow beach. Or, to change the metaphor, what is gayer to look upon—when the golden flower-heads grow apart and not in clusters—than on such a morning to see them swinging and swaying upon their tall tubular stalks, and preening their canary plumage, for all the world as if a thousand of these joyous song-birds had suddenly broken cage, and, after the first wild, delirious burst of freedom, had perched upon the rocking reed-stalks of river-margining meadows, there to play at see-saw with the wind, and to pour out their hearts in pulsating pæans of praise? Yet, for all its loveliness, the dandelion is so despised a flower that the milk of its kindness may well have turned bitter and acrid in despair. Rejected here in England from its rightful place in the salad-bowl, and ruthlessly rooted out when it dares to set foot in garden or on lawn, the dandelion comes into the world with a grievance ready-made against us. How is a flower handicapped by a name with so harsh a meaning as 'lion's tooth' to hold its own against rivals upon which such endearing and caressing love-names have been bestowed as forget-me-not, ivy, lily of the valley, daffodowndilly, heart's-ease, grass of Parnassus, star of Bethlehem, traveller's joy, honeysuckle, or meadow-sweet?

Moreover, the daisy, buttercup, bindweed, violet, foxglove—some of them less lovely than the dandelion—can boast that they have been counted worthy of cultivation, and can point, in garden and conservatory, to aristocratic relations, fed, watered, and waited on by that lord of creation man, who has voluntarily constituted himself their servant, and either himself fetches and carries at their bidding or else pays other men to do so. But the dandelion no one counts worthy of being cultivated or considered. It cannot be because of the dandelion's commonness, for even daisies and buttercups—commonest, I suppose, of all flowers—esteem themselves his superior in the social scale, and possibly patronise the dandelion by lisping allusions to 'my garden cousins the bachelor-buttons' or 'my distinguished relative the globe-flower.' The very children at play in the meadows, weaving daisy-chains and gathering big bunches of buttercups, rarely think the equally beautiful and more fragrant dandelion worth carrying home to stand in a tumbler of water; and when he is old and gray they make mock of him by pretending he is a clock, and pluck his be-flowered pate bald as a mushroom or a mahl-stick, to watch each silver thread borne aloft and away like a fairy parachute.

About the poppy one has many fancies. Never was fine lady gowned more gorgeously than she, and never did fine lady pack so gay a gown into so small a space. She comes to town clad in plain green travelling-dress, and with no luggage other than a green reticule in her hand.

'Dowdy, I call it, my dear!' says one overdressed town geranium to another. 'Fancy coming to London, and in the season, without so much as a change of frocks! What's that green rolled-up thing she's carrying—a nightdress-case?'

'Oh, don't bother me about the fright!' snaps the other geranium. 'London's too exhausting in the season for one to be able to think of anything more than one's figure and one's complexion. Mine's hopelessly ruined, I'm sure, and my temper's worse. One has to fulfil one's engagements and keep in evidence in the social world, I know; but the gravel in this garden is as dry and arid as the desert sand, and we geraniums always get put near the gravel and in the glare. I'm simply gasping and panting with the heat. If only one of those sprawly country nasturtiums—common creatures, aren't they? with no idea of "holding themselves,"

[*All Rights Reserved.*]

and quite out of place outside a cottager's garden—would lend me that Japanese sunshade that she calls a leaf!'

By-and-by the country poppy, that the geranium had called a 'fright,' opens what the other geranium had taken to be a green nightdress-case, and shakes out the loveliest, lightest crimson court-gown of shimmering spun-silk that ever was seen away from fairyland; and the two geraniums turn white with envy, and the despised and dowdy poppy queens it regally in the garden.

It is only a single poppy that makes me think of a fine lady in her silken gown. Sometimes one sees a field of ripe and waving corn as patiently and peacefully awaiting the coming of the reaper as full-uddered kine await their milking, or as good Christians whose years are overripe, whose race is run, and whose peace is made with heaven, await the calm coming of death. The scene is so idyllically peaceful that no one would suspect the presence of hidden foes. But as one approaches and skirts the corn-field's flank one is alarmed to detect sudden stains and patches of red; and, looking closer, one sees whole regiments of poppies, crouching low, like scarlet-coated soldiers, and 'taking cover' among the corn, that they may steal stealthily upon and surprise some unsuspecting defenders. At other times when I see a poppy lifting the crimsoned cup of its chalice high above the heads of the growing corn that one day will be made into bread, I think of the white and red of the wine-cup and the bread in the hand of our Lord at the Last Supper, and bow my own head in a silent prayer.

Then there is the bluebell, azuring our English glades as the heather purples the heaths of Scotland. Here in Sussex I have seen the bluebells lie so closely together in the hollows that one might think our Sussex sea had broken bounds and overflowed the land in blue lagoons of loveliness.

But more even than the bluebell I love the wood-anemone. Every painter dislikes to show his masterpiece merely as a square of canvas, knowing that it is not seen to advantage lacking the finish and the setting of a frame; and I sometimes think that God, the Great Artist, is so justly and supremely proud of His loveliest miracle and masterpiece of wild-flower perfection—the wood-anemone—that He does not wish it to be seen away from its framing of exquisite green.

Plucked primroses, bluebells, and violets, apart from their leaves, look to me like pictures seen without a frame, or like loose jewels and detached gems that have lost something of sparkle and splendour by being taken out of their setting—for primroses, bluebells, and violets have one stalk for the blossoms and another for the leaf. In making a posy we must first gather our flowers, and then, if we wish our woodland gems, hillside jewels, or meadow pearls to be seen in Nature's setting, we must pick or add a framework of green. It is not so with the wood-anemone. Flower and leaf grow upon one stalk. Pluck a wood-anemone, and you have your wild-flower jewel set and complete. Half-way up the 'gracile' stalk—it was Rossetti who enriched our language by that flower-like and flower-lovely adjective, so suggestive of exquisite grace and lightness of line and curve—there branch out three delicately fronded leaves falling away from what I may call the flower's waist and lower limbs, and leaving the flower-bust and flower-shoulders bare, just as the bust and shoulders of the Venus de Milo are left bare by the drapery which falls away from the statue's waist. It is for this reason perhaps that I never see a rose-flushed cluster of wood-anemones hastily gathering, as it were, with one hand their green drapery around them, without thinking of wood-nymphs surprised by an intruder just as they had prepared for a bath, and were standing hesitating and trembling before taking a plunge into the cool depths of some still and shaded pool.

II.

I remember once telling a small but precocious girl-child of my acquaintance that I liked to think of butterflies as the angels or souls of flowers. 'The flowers,' I said, 'are like the sleeping princess of the fairy story. We know that they are alive, for they open during the day and shut at night; but, like the princess, they make no sign, and never leave their sleeping-place of green grass, garden-bed, or good brown earth until Prince Death comes to kiss them and awaken them to warm life. Then they spread wings of their own white, crimson, or cornflower-blue, and soar away, flower-souls afloat in the heaven of this wonderful world.' To illustrate my fancy I showed her how like the wood-anemone, frail-poised upon its fragile stalk, and bending with every wind that blows, is to the slim and dainty 'orange-tip' or 'wood-lady' that is borne along with, and cannot fly against, the breeze; how the tiny 'speedwell' seems petaled with wings of butterfly-blue; how the hardy 'brimstone' that dances by on a sunny day in winter, or is buffeted past upon the winds of March, is like an early daffodil.

But the small child in question was one who thinks for herself, and had apparently profited by what in these days of controversy about education is, I believe, known as 'simple Bible teaching.' She evidently was not to be put off with fairy stories or fancies of my devising. 'I think it much more likely,' she said with an insufferably grown-up and superior air, 'that the explanation of the relationship between flowers and butterflies is to be found in the Book of Genesis. We read that God made Adam first, and then took a rib out of him to make Eve, his wife. I expect that God made butterflies first, and then, thinking, as He did about Adam, that it wasn't good for them to be alone, He made flowers, not out of a butterfly's rib—for I don't suppose a butterfly has one—but out of a bit of his wing, which I dare say did equally well; and that the flower is the butterfly's wife, and has to stay at home and keep house for him, while he goes

gadding about and enjoying himself, just like a man.'

I was abashed to find that I had been trying to please with my foolish and unappreciated fancies a young person who, if she had only been born a few years earlier, would probably have been dressed in green and purple and white. But her reference to the Book of Genesis reminded me of a curious fact which appears to have escaped the notice of biblical commentators. It is that not once in the biblical record of creation, not once in the whole of Genesis —though we read of 'grass,' 'herb,' 'seed,' 'fruit,' and 'tree'—does the word 'flower' appear.

An equally striking fact, which also appears to have been overlooked by commentators, is that there is no mention of 'love' between Adam and Eve or between any of the creatures which God had made. We read that male and female created He them; that Eve conceived and bare a son and called his name Cain, saying, 'I have gotten a man from the Lord;' but of the sacred passion of love, as existing between man and woman, we read never a word. It would seem as if, thus early in the world's history, God's one thought was for the 'fruit' and the 'seed,' His one wish to see appear upon the scene the generation that was to come after; and as if the calling into being of flower-glory and flower-beauty, and of the sacredness and beauty of the ennobling passion which we speak of as love, had been—like woman herself—an exquisite afterthought, in which God surpassed Himself in one of the supremest and divinest conceptions that ever entered even into the mind of God.

III.

As a very young child I firmly believed that lightning was the writing of God's own name, by God's own hand, across the scroll of the sky. I remember, too, that I accounted for the lightning being seen only as it vanished on the assumption that upon sight so awful as the name of the Infinite One, in His own handwriting, mortal eyes must not for more than a moment be permitted to look. In those child-days I had never so much as heard of the terrors associated in the Hindu mind with the mystic name Om—a name of such awful import and sacredness that to write it, or to read it when written, or even to whisper it under one's breath were blasphemy unthinkable; so possibly this idea of mine about the lightning was not of my own imagining, but was put into my head by some devout person who wished to instruct me in due reverence for things sacred.

Later on, as a boy of ten, being interested in what I heard about the Pyramids, and about the star-watchers and astrologers of old, who by reason of knowledge lost to us moderns could (so I was informed) read the signs of the sky, I was ready as implicitly to believe that the heavenly constellations are messages for us mortals, written in hieroglyphic characters by an almighty hand, and set there for our deciphering and to stimulate us to study God's ways. Fired by the success which I heard had attended the efforts of Egyptologists in interpreting the inscriptions upon ancient monuments, and by having myself achieved some reputation among my fellows by the ease with which I had discovered the key to a much-admired cipher invented by the genius of the school, and popularly believed to be beyond all human detection, I undertook, with presumption not unworthy of the builders of the Tower of Babel and of certain exponents of religion in our own time, to unravel these mysteries and to make known authoritatively the will and the purposes of the Most High. The Great Secret, the secret of life and death, of birth and the beyond, of man's destiny and God's being, is still to seek—my boyish star-searching notwithstanding; but now when I am no longer a boy I never seem so near the hiding-place of the secret as when I look into the heart of a flower.

> Flower in the crannied wall,
> I pluck you out of the crannies,
> I hold you here, root and all, in my hand,
> Little flower; but if I could understand
> What you are, root and all, and all in all,
> I should know what God and man is.

As in my boyhood, I still think of the starry constellations as hieroglyphics written on the scroll of the heavens for universes to seek to decipher; but flowers are to me like dear and intimate letters addressed personally by God to each of us, and delivered directly from Him, almost at our very doors, by some angelic messenger.

It is true that they are not written out for us in words, for at God's thoughts the cramped confines of our halting human speech can only hope to hint. God speaks to us, as Christ spoke to His disciples, by the poetry of signs and symbols; and even as Christ, when most anxious to make clear His meaning, and compelled to fall back upon mortal utterance, spoke to the imagination rather than to the ear of His hearers by delivering Himself in parable, so it is by parable and picture that God utters Himself most directly to us to-day. We see God's thoughts expressed in a sunset, in a rainbow, in the small bird beating herself against the hawk to defend her brood, in a love-kiss, in a young mother's first sight of her babe, in a flower in the field, a face in the street, and in the trustful purity of child-eyes; and the sight of these thoughts of God, thus pictured for us, means infinitely more to us than could ever be put into words.

> Canst thou copy in verse one chime
> Of the woodbell's peal and cry,
> Write in a book the morning's prime,
> Or match with words that tender sky?

God's simplest, greatest, and most directly intelligible word of utterance to man was the Incarnation of His Eternal Son. 'In the beginning was the Word, and the Word was with God, and the Word was God.' And even as 'the Word was made flesh and dwelt among us,' so to me every flower that blooms is in a sense a Word of God; for in every

clump of flowers on hillside, in the hedge-bank, or in my garden I seem to see a tiny handspace of heaven visible here upon earth. 'I know there is a heaven because the flowers came from there!' said a little child once, and I am not sure that her child-logic was not a surer guide than all our science.

Yet the secret of the flowers God never lets us make our own. Every year, with the coming of the snowdrops, I say to myself, 'Ah, 'twas but because in other years I was less grateful than I ought to have been for this gift of flowers; because, after the first glad rapture of surprise was over, I too often forgot them in other and meaner gladnesses, too often allowed them to bloom and to die unheeded; 'tis for this reason that the snowdrops have come and gone and left their secret untold.' And every year I take heart of hope, and tell myself that I will search and listen for that secret anew. Yet every year I awake one morning to find that the snowdrops have come and gone—gone as irrevocably as our loved dead—and taken their secret with them. And even as we shed scalding tears at the sight of the still face of the dead, and kneeling beside the bier, entreat them, if only for a few moments, to give ear and listen that we may beg their dear forgiveness for cruel words spoken and loving deeds left undone, even so I cry out to the snowdrops to come back to me that I may speak my love and may hearken for their secrets. And when the wilted flower-heads that once were so glorious in silver and green hang limply on their stalks, or seem to shake their dry and withered bells as if to toll, 'Too late! too late! We would have spoken had you listened, but we cannot tell you now,' I am as sad and as heavy at heart as if some dear friend, whom haply I may never see again, had gone forth to journey in a far and unknown country with my farewell words of love unspoken, and my wishes for his safe return unsaid. And so it is with other flowers. Each year I tell myself that *this* spring, *this* summer, *this* autumn, at least, the lily and the rose, the heart's-ease and the honeysuckle, the sweetbriar and the wood-anemone, shall come assured of such love and welcome, shall creep so close to my heart, and I so close to theirs, that at last they shall bid me bend low while they whisper that secret which the soul of every flower enfolds, and yet withholds from mortals. And each year the flower-pageant and flower-procession come and pass, and the white winter snows hide them away until spring returns, and once more I listen for that whisper in vain. The secret of the flowers God never lets us make our own.

---

# LAURISTONS.

### CHAPTER XXXIV.—HOW ONE ESCAPED AND ONE REMAINED IN THE CAGE.

THAT distinguished free-trader Paul Lebon was fortunately still above water, and still more fortunately in harbour at Honfleur when the travellers arrived there, and within an hour Sir Charles was sleeping like a top in the musty cabin of the *chasse-marée La Mouche* as she plunged up-Channel for Newhaven.

He was awakened by a heavy hand on his shoulder and a hearty voice in his ear, '*V'là, m'sieur!* we have arrived!' And that was all he remembered of the voyage.

'If ever monsieur wishes to return,' said M. Paul, as he stowed away his honestly earned reward, 'I shall be happy to oblige him. A word to the host of the "King George" at Newhaven will suffice. I am frequently in these parts.'

Then into a small boat in the dark, and Sir Charles was set ashore with instructions to strike up to the road and keep straight on to the left. At Newhaven he procured conveyance to Brighton, and was at Grosvenor Place before the household was astir.

'Oh, my dear, how glad I am to see you safe home again!' said Lady Charles as he sat on her bedside. 'I was in great fear for you. Where is Mavie?'

'She is at Mortaigne with Charlotte and the marquis.'

'Not with you? Oh Charles!'

'She will be quite safe, Mary;' and he detailed the circumstances of his own escape across country.

'But for Talleyrand I might be prisoner there myself. He promises to see to Mavie.'

'I would sooner have Mavie's hand in mine than all M. Talleyrand's promises. If there is to be war again he will be too busy to think about a girl. Oh, I wish you had brought her, Charles!' forlornly, in spite of herself, as though foreseeing what might come.

'If it had been at all possible I would have done so, dear. But, you see, we knew nothing out there in the country. And when I reached Rambouillet, and learned what was towards, it was a case of leaving at once for the coast or stopping in France at Bonaparte's pleasure; and that I could not afford to do,' he said, with something of the weariness of his journey still upon him.

Her tense perception caught the undercurrent in his tones. It started all her old fears for him.

'Charles dear,' she asked anxiously, 'is there anything wrong? You are troubled. You are overburdened.'

Would it have done any good to tell her? Would the sharing of his burden have lightened it in any degree? Why lay so grievous a load on a heart that was never meant to bear it?

He could not! He could not! It would crush her to the ground—into it maybe. If it had been only trouble and loss. But the shame of it! No, it was impossible! Often, afterwards, he doubted and regretted, but then it was too late; the path he

had chosen he must travel alone, or at all events with no other companion than John Sax.

And so, following his own lonely road, he said gently, 'Yes, I am burdened, dear. This new outbreak of the war is a bad business. The world is sick of war, and we are all more or less exhausted.'

Her sweet, truthful eyes held him for a moment with a great yearning in them. He was hard put to withstand that most pathetic gaze. The lovely face looked a little thinner, he thought, the great dark eyes a little larger, than when he left her. His troubled soul came near to falling headlong into those wells of truth in full and absolute surrender. But he must not! he must not!

He took grip of himself, and said more lightly, 'But, as to Mavie, I am sure you need have no fears, dear. Talleyrand will keep his promises to me, and meanwhile she is quite safe and happy over there.'

'We will hope for the best all round,' said Lady Charles, sinking back among her pillows with a not very hopeful little sigh. She had done her best to open a closed door in his heart, and knew that she had failed. And thereafter—though she knew there was some hidden thing between them, and though he dimly feared she knew it, and though that knowledge was never absent from them, and raised a tiny shadow between them—she on her part never for one moment doubted that in keeping the matter to himself he was acting for what he believed to be her good, and she gave him her whole heart's love, although she might not share his burden, as she would have liked to do.

---

### CHAPTER XXXV.—HOW JACK LIVED ON GOLDEN MEMORIES AND GREW HIS MUSCLES.

'THANK God!' said John Sax fervently when Sir Charles came into the private room in the bank. 'I was in mortal fear he had got you; and if he had'——

'Talleyrand helped me through. If it hadn't been for him'——

'Monsieur Talleyrand has done better than he knew. Lord Whitworth arrived yesterday; but some of his staff were intercepted at Calais, and there are hundreds of others caught in the net. It is infamous!'

'Just what I said to Talleyrand, and he shrugged his shoulders and said, "Spleen." How have things gone on?'

'All safely, sir; but in another day or two I should have been needing you, and if you had been locked up there'——

'I came at a moment's notice, and left Mavie behind. Talleyrand sent a messenger after me to Mortaigne, simply bidding me come to him, and when I got to him he sped me on to the coast.'

'My lady won't like Miss Mavie being left over there; but she will be safe with the marquis, I should say.'

'She will be all right, and Talleyrand promised to get her across as speedily as possible. Now, let us see how things stand.' And they settled their necks to the yoke.

Young Jack did not get the chance of any conversation with his grandfather till they met at supper that night.

The moment he was free from his high stool he had set off for the river at Westminster, where—on ocular demonstration to his grandfather of his capability of taking care of himself both in and on the water—he was permitted to keep a small boat of his own, in charge of one of the watermen, who unbeknown to him let it out during the day whenever chance offered, but always took good care that it was available when its owner hove into sight of an evening. It had never been a very elegant boat even in its best days, and it had not cost very much in its last; but Jack found mighty satisfaction in it as an outlet for the pent-up activities which found the hours on the office-stool creep so slowly and heavily.

The office-stool and its concomitant drudgeries tended towards ruts and grooves. The grip of his oars in the swirling brown water and the swish of the wind in his ears lifted him into a wider world of freedom and the grace of easy motion. If all day long his mind was set to his work as closely as his body to his stool, the evening found him his own man anywhere between Fulham and Westminster, and on occasion down the other way among the docks and shipping, which gave a foreign flavour to the expedition; and there his head shook free of its tangles, and his chest expanded, and his arms and legs grew mighty muscles, and the sudden little emergencies incidental to this nautical career were not without their effect upon him. The faculty of quiet, calm-eyed views, and quick decision, and prompt action grew in him, and applied themselves to the things that lay beyond the circumscribed rim of his boat. And the thoughts he thought as he pulled steadily up on the flood or drifted lazily back on the ebb! Ah, the thoughts of a boy are long, long thoughts, and happy the boy who has such a sun and centre for them all as young Jack had. Even though the sun be a very long way above us, and unattainable as an actual possession, still its smile may warm our heart; and when it is obscured we think of it as we have known it, and long for another sight of it. The sun is, of course, the sun, and we are but a very insignificant person occupying a stool, whose dignity is in inverse ratio to its height in the sublunary banking-house of our sun's father.

It was, of course, an age that set men to think on the essential slenderness and easy breach of the lines of division between man and man. Robert Burns—whose words were dear to Hepsy MacClootie's heart, though she looked somewhat askance at his character generally—had sung that rank was but the guinea-stamp, and the man was the gowd for a' that; France had worked out the same mighty

sum for herself in figures of blood, and these things had their large and deep effects on the hearts of all.

But as to young Jack Sax, coming down from Parson's Green way with a rush lest he should be late again for supper, all that he, confessedly to himself, permitted himself to hope was that he might be deemed worthy, when the time came, to occupy to his old chum Charlie the position which his grandfather occupied to Sir Charles; and at times he was amazed at himself for thinking such a thing possible, so vast was his grandfather's knowledge of men and things. And then he said to himself, 'All the same, I know more about banking than Charlie does yet, and I suppose the rest will come. I just hope he won't go and get himself killed beforehand.' And as to Mavie, she was chiefly of the nature of a seedling rainbow, and his remembrances and thoughts of her did no one any harm and himself nothing but good.

'Miss Mavie got home all right?' he inquired, as he sat down to his supper with a livelier appetite than bank-stools breed.

'She's in France,' said his grandfather.

'In France!' for he had heard rumours of the closing of the doors.

'They were all away in the country at one of the marquis's houses, and knew nothing. A friend of Sir Charles's sent for him in haste, without telling him why, and then sent him riding night and day for the coast.'

'Leaving Miss Mavie behind!'

'If he hadn't he'd be there yet, and might be kept there for weeks. She'll be all right. She'll get a little longer holiday than she looked for, that's all.'

'Her mamma won't like her being away so long,' said Mrs Sax, with a knowing nod; 'with Master Charlie away all the time too. She'll feel lonesome in yon big house with no one but Mrs MacClootie for company.'

'Yes, it'll feel empty with Miss Mavie and the marquis and madame and Etienne all away.'

'How's Etienne getting on, I wonder? I'd like to have seen him on the boat. I'll wager you he went green,' growled Jack, with just a touch of the feeling that would come over him at times that the turn of the wheel had carried the forlorn and despised one into perpetual sunshine, and left himself but sunny memories to live on.

'He'll go into the army, I should say,' said Mr Sax. 'They seem to be settling down to the new order of things over there, and I doubt if the Bourbons will ever get back, and I'm not at all sure it would be good for the country if they did. From all accounts, General Bonaparte is the right man for them. He is a strong man, and knows what he wants and what they want.'

'Did Sir Charles see him?'

'Only at a distance—and a good thing, too. If Bonaparte had laid hands on *him* there'd have been something to pay. General Lauriston told us that Bonaparte had said to him more than once that the only thing he had against him was his name.'

'Suppose he lays hands on Mavie?'

'Miss Mavie,' said the old man with emphasis, 'is in safe hands. The friend who got Sir Charles out will see to her.'

'And it's to be fighting with Boney again, John?'

'Yes, my dear; we can't let him have everything his own way, you know.'

'He seems a troublesome kind of man—never satisfied, it seems to me.'

'That kind of man never is until he's in his grave. Sir Charles says they all want peace as much as we do.'

'Well, then?'

'Well, they'll get it maybe when he's dead, not before.'

'It would be a queer thing if Charlie and Etienne met on opposite sides!' said Jack.

'Queerer things have happened in war-times. I don't suppose either would wish it, but soldiers must do as they're bid.'

'I know some old Etienne wouldn't mind meeting,' laughed Jack, reminiscent of fagging days at Westminster. 'How will matters go this time, do you think, sir?'

'Austria and Russia will join us, of course,' said Mr Sax, and went on to unfold to Jack his views of the probable course of events abroad, and discoursed thereon with such sagacity as the then but partial understanding of Bonaparte's genius for war permitted.

It was his regular custom to discuss thus with his grandson all matters of moment, public and political, and their bearing on matters financial; a part of the plan and hope of his heart, also, that some time, if by the mercy of God they were permitted to pull through, the boy should take his place in the house, and be to Sir Charles—after he himself had gone, or to the next Sir Charles if they both must go—what he had been so long himself: the second head and trusted right hand, the confidential friend and adviser; if needs be (which God forbid!) the faithful abettor in all that might be necessary for the buttressing of the great house against disaster.

And Jack understood—as far as it was good for him to understand—and had made up his mind that since he had to be in a bank he would be a banker, and not simply a banker's clerk. And so he sought knowledge on every hand and made it his own; and to counteract the effect of too much shoppiness he rowed and read, and spent hours of his winter evenings at Monsieur Billoti's fencing-school in Dacre Street, and at Tom Cribb's academy in Pye Street, where gentlemen were politely instructed in the use of their fists with or without gloves, but generally with.

So were our young comrades of the warpath sifted out and scattered, and of them all young Jack Sax alone within bounds, since he was more or less tied by the leg to his bank-stool; Charlie fitting himself for the defence of his country at his army tutor's at Newbury, where the hunting was good and the

discipline the reverse of severe; Etienne heading for St Cyr and whatever that might lead to; Mavie, unwilling *détenue* in foreign parts, earnestly desirous now to be done with France and to get back home, but forbidden thereto by the caprice of the tyrant whom Liberty, Equality, and Fraternity had seated in the saddle, and whose strong hands gripped the reins with ever-growing purpose.

---

### CHAPTER XXXVI.—HOW THE TIGER TRAPPED MAVIE.

OR it had come to that. Before M. de Talleyrand had been able to fulfil his promise to smuggle Mavie out of the country, Bonaparte had learned all about her and promptly double-locked the doors. Possibly he had learned too late of Sir Charles's visit and narrow escape, and determined to hold on to her for mere purposes of aggravation. The great man was by no means above such littleness as that.

This was how it came about. On receiving Sir Charles's letter to Mavie—which gave them the first news of the rupture and the closing of the ports, and at the same time bade her keep her mind quite easy, as M. de Talleyrand had promised to see that she got safely home—monsieur and madame decided to return to Paris forthwith, since the call from M. de Talleyrand might come at any moment.

A day or two after their return monsieur and madame were bidden to a reception at the Tuileries, and Mavie was filled with a very natural desire to see not only all that was possible, but above all the wonderful First Consul, of whom all the world was talking. And the way was easy, for the invitation was vaguely worded 'and family,' as though the secretary who made it out was in the dark as to the extent of monsieur's family, or was so much in the habit of adding the words that they had slipped in without any express instructions thereto.

So it was decided that both Etienne and Mavie should accompany the marquis and marquise, on the clear understanding that mademoiselle should keep herself discreetly in the background and see all she could without attracting observation.

But there were two elements in this arrangement which made for its upsetting: Mavie's own wild excitement and eagerness to make the very most of so unique an opportunity, and the First Consul's equal desire for knowledge.

They drove through a courtyard resonant and dazzling with magnificent cuirassiers, climbed a long flight of stairs lined with courteous lackeys, and entered a great room already filled to overflowing with gorgeously dressed women and brilliantly uniformed officers, and a murmurous buzz of talk as though all the bees of the Napoleonic hive had come prematurely to life and were giving their opinions on things in general.

Discomfort of great heat and pressure inside, lively music from the bands in the courtyard, then the opening of a distant door, and a sudden hush and a tightening of the pressure as the crowd parted to make room for the First Consul.

He was a long time coming, chatting here and there with one and another. But at last, through the jungle of Aunt Charlotte's drooping plumes, Mavie caught a glimpse of a sallow, oval face and a pair of keen, light-gray eyes—face and eyes alike aglow with self-satisfied good-humour at the moment, and she felt a sudden thrill at finding herself so close to the most wonderful man of his time.

She was staring through the feathery jungle with something of fascination in her blue eyes, and feeling much as a baby-rabbit does when the great snake is considering it, when Bonaparte recognised the marquis and came straight towards him.

'Ah, M. de Montessonne, I am glad to see you here! You suggest something we have somewhat lacked. This is madame?' and Aunt Charlotte swept him a curtsy which left her the envy of all beholders, zealous pupils though they all were of Madame Campan and M. Despréaux, who were doing their very best to teach them how people comported themselves in the days before the deluge.

'And this?' he said, catching Etienne by the top button of his coat.

'My grandson.' And Etienne produced the De Montessonne bow, rather awkwardly under the circumstances, but still sufficiently well.

'You are sending him to St Cyr?'

'That is his wish.'

'That is right. St Cyr is the doorway to glory.'

And suddenly the plump, shapely hand shot through Aunt Charlotte's feathery screen, and the fascinated baby-rabbit behind—the astonished Mavie—found her ear caught firmly and held between a strong thumb and finger.

'And this?' asked Bonaparte, delighted at his capture; while Aunt Charlotte ducked herself away with a movement that was in itself a perfect lesson in deportment, and Mavie stood captive, rosy-cheeked, wide blue eyes, parted lips—a picture of startled maidenly beauty.

'My niece—by marriage,' said the marquis, just a little disturbed at possible consequences, but showing no slightest sign of it.

'Ah, ha! and a very charming acquisition to any man's family.—Your name, mademoiselle?'

'Mary Lauriston, monsieur.'

'Lauriston!' and the smooth olive brows knitted for a moment over it. 'Of course, madame belongs to the great family. I too have a Lauriston, but he is not nearly so good-looking;' and he gave Mavie's rosy ear a pinch and a pull and passed on.

They were inclined as they drove home to make merry over the great man's brusquerie, all except the marquis, who seemed thoughtful. And, indeed, the very next day he received word from M. de Talleyrand that the First Consul had given the most stringent instructions that Mademoiselle Lauriston was upon no account to be permitted to leave Paris. So small can even great men be, to such apparently

trivial matters can great minds give themselves, and to such below-belt blows could the might that was paralysing Europe condescend! But that was Bonaparte. Nothing seemed too great for him to attempt, nothing too small to attend to.

So Mavie became to all intents and purposes a prisoner at large, and found herself just that much better off than the hundreds of her fellow countrymen and women similarly detained in that she was permitted to reside with her kinsfolk in Paris, whereas the others were sent towards the eastern frontier, and interned in Verdun and Sarrelouis and Metz.

---

### CHAPTER XXXVII.—HOW MRS MACCLOOTIE URGED DESPERATE MEASURES.

ALL correspondence between England and France was stopped, but still letters did at times get through by incredibly roundabout methods and by means of the free-traders, who cheerfully went about their business without regard to politics, and were at the disposal, to the extent of their limited powers, of any who chose to employ them. So the weeks dragged heavily into months, and Lady Lauriston's heart was heavy with anxiety on her daughter's account.

The sudden and unexpected rupture of the much-desired peace had paralysed business, and there was a certain stringency in money matters. It was something of a relief to Sir Charles that, no matter how much the marquise might desire to get on with her rehabilitation of the wasted De Montessonne estates, it was quite beyond his power to transmit to her the thirty or forty thousand pounds which she might require for the purpose, and which, at the moment, they could have spared only with difficulty.

Charlie, gazetted to a cornetcy in his father's old regiment, was in the very highest of spirits, with only one fear: that all the fun, as he called it, would be over there, and that England would sit quietly behind her rolling barriers, watching and waiting as before, subsidising her changeful allies to their hearts' content, but leaving the game entirely in their hands.

But the most hopeful of assurances, lacking any slightest fruition of accomplishment, lost their force in time. And hope deferred, if only deferred long enough, may make the stoutest heart sick unto death. It was only strength of will and a most valiant spirit that had kept Lady Lauriston's frail lamp alight. This violent deprivation of one of her greatest joys in life bore terribly upon her. Mavie, with her manifold and joyous activities, her impetuous cheerfulness, and wholesome delight in life, had ministered to her mother's troubled soul in ways she never dreamed of. And to have the child suddenly snatched from her by the ruthless act of a tyrant who spared none; to think of her there in a foreign land at the mercy of such a man! Yes, it was hard to bear, and its effects soon became visible.

In the first twelve months of Mavie's captivity one letter only reached them, many months after it was written, and that—describing in gleeful fashion the amusing side of her first meeting with Bonaparte, and with no slightest idea of all that was to come of it—almost jarred upon them by the contrast of its light-hearted gaiety with the sombre screen of the intervening months of slowly waning hope and growing heart-sickness. Then followed a long, blank silence, a silence full of heart-racking disturbance to the anxious ones at home; for when a single day—or for that matter any single moment of the day—may hold all possibilities of ill to the distant loved one, how shall one estimate the cumulative effect of the passage of the blank days as they dragged slowly on into weeks, and the weeks became months, and the months became a year?

Sir Charles and Hepsy MacClootie, sadly conscious of the havoc wrought by this long-drawn anxiety, did their utmost to comfort the aching mother-heart. But words are poor and empty and of the outside only, and heart-sickness is beyond their healing.

The brave, frail heart bore its new burden heroically for longer than had seemed to them possible, but heroic endurance has its limits. Sir Charles had left no stone unturned to procure his daughter's release. But as matters were between France and England, his efforts were fruitless. One belated despatch he received from Talleyrand to the effect that, in spite of all his attempts and most urgent representations, Bonaparte simply and flatly refused to let her go. 'I have suffered from Lauriston's operations; now it is my turn. Let him suffer!' That, according to Talleyrand, was the great small man's final word on the subject. Meanwhile M. de Talleyrand had pleasure in assuring them that Miss Lauriston was in good health, though visibly *ennuyée* of her stay in Paris.

It was well on in the second year that Mrs MacClootie, with a face full of concern and purpose, came down to Queen Street one night for a confidential talk with Mr and Mrs Sax. Jack was out on the river, and could be counted upon not to put in an appearance before nine o'clock.

'And how is my lady, Mrs MacClootie?' asked Mrs Sax.

'She is dying, Mrs Sax.'

'Dying!' echoed her hearers in dismay.

'Just dying for want of Miss Mavie. And it's that I've come to talk to you about, Mr Sax. We—must—get—Miss—Mavie—home.'

'If wanting to do it could have done it she'd have been home long since, Mrs MacClootie.'

'Well, we've got to get her. And I want you to propose to Sir Charles that we should steal her out of that wicked man's hands. My only surprise is that we haven't thought of it before.'

'We have,' said old John quietly. 'There have been many tried it—not with Miss Mavie, but with others; but they're too sharp over there, and the only results have been a few more in their prisons.'

'Well, try again and again. You might manage it

at last. If you don't my lady will surely die. Why doesn't Master Charlie try to get his sister home? If he knew all that his mother is suffering'——

'Master Charlie can't help himself. But you're not to speak of it to my lady. We only got word to-day.'

'He's ordered abroad?' gasped Hepsy, for she knew how heavy lay the fear of this on her mistress's heart. It might be the last straw.

'No. He's had a nasty fall out hunting, and he's broken his collar-bone and his right leg and three or four ribs.'

'Mercy me! Will he get over it, Mr Sax?'

'Oh, he'll get over it all right, but it means lying stiff and straight for many a day.'

'Very well, then,' said Hepsy, much relieved that things were no worse. 'Then it's your boy must go across there and bring Miss Mavie home.'

'Our John?' It was Mrs Sax's turn to gasp now.

'Just that! And there's not another in the world I would sooner trust her with.'

'Well, well!' said Mr Sax musingly. And after a pause, 'It's not the risks will stop him where Miss Mavie is concerned, though they're not small ones. At the worst it might mean his life; at the best, if he fails, it would mean imprisonment.'

'And if he gets her safely out it means new life to my lady,' said Hepsy earnestly.

'You want me to speak to Sir Charles?' asked Mr Sax after another silence.

'You must. I cannot. He might take it presumptuous in me. But you can tell him what I say, Mr Sax. If Miss Mavie doesna come back my lady will surely slip through our hands.'

'I will speak to him,' said John Sax.

*(To be continued.)*

---

# THE BRENNAN MONO-RAIL CAR.

By Perceval Gibbon.

IT was November 10, 1909—a day that shall surely have its place in history beside that other day, eighty-five years ago, when George Stephenson drove the first railway locomotive between Stockton and Darlington. In the great square of the Brennan torpedo factory at Gillingham, in Kent, where the fighting-tops of battleships in the adjacent dockyard poise above the stone coping of the wall, there was a line of railway laid down in a circle of a quarter of a mile. Switches linked it up with other lengths of line, a straight stretch down to a muddy cape of the Medway estuary and a string of curves and loops coiling among the stone and iron factory sheds. What was strange about it was that it was single—just one line of rails on sleepers tamped into the unstable 'made' ground of the place. And there was Louis Brennan, his face red with the chill wind sweeping in from the Nore, his voice plaintive and Irish, discoursing at slow length of revolutions per minute, of 'precession,' and the like. The journalists from London who had come down at his invitation fidgeted and shivered in the bitter morning air; the affair did not look in the least like an epoch in the history of transportation and civilisation, till—

'Now, gentlemen,' said Brennan, and led the way across the circle of track.

And then, from its home behind the low, powder-magazine-like sheds, there rode forth a strange car the like of which was never seen before. It was painted the business-like slaty-blue gray of the War Office; it was merely a flat platform, ten feet wide by thirty feet long, a steel cab mounted on its forward end, through the windows of which one could see a young engineer in tweeds standing against the blur of moving machine-parts. It ran on the single rail; its four wheels revolved in a line, one behind another, and it travelled with the level, flexible equilibrium of a ship moving across a dock. It swung over the sharp curves without faltering, crossed the switch, and floated—floated is the only word for the serene and equable quality of its movement—round and round the quarter-mile circle. A workman boarded it as it passed him and sat on the edge with his legs swinging, and its level was unaltered. It was wonderful beyond words to see; it seemed to abolish the very principle of gravitation; it contradicted calmly one's most familiar instincts. Every one knows the sense one gains at times while watching an ingenious machine at its work—a sense of being in the presence of a living and conscious thing, with more than the industry, the pertinacity, the dexterity, of a man. There was a moment, while watching Brennan's car, when one had to summon an effort of reason to do away with this sense of life; it answered each movement of the men on board and each inequality in the make-shift track with an adjustment of balance irresistibly suggestive of consciousness. It was an illustration of that troublous theorem which advances that consciousness is no more than the co-relation of the parts of the brain, and that a machine adapted to its work is as conscious in its own sphere as a mind is in *its* sphere.

The car backed round the track, crossed to the straight line, and halted to take us aboard. There were not less than forty of us, and it took up our inequably distributed weight without disturbance. The young engineer threw his lever over and we ran down the line. The movement was as 'sweet' and smooth as the movement of a powerful motor-car running slowly on a smooth road; there was an utter absence of those jars and small lateral shocks which are inseparable from a car running

on a double line of rails. We passed beyond the sheds and slid along a narrow spit of land thrusting out into the mud-flanked estuary; men on lighters and a working-party of bluejackets turned to stare at the incredible machine with its load. Then back again, three times round the circle, and in and out among the curves, always with that unchanging stateliness of gait. As we spun round the circle, she leaned inwards like a cyclist against the centrifugal pull; she needs no banking of the track to keep her on the rail. A line of rails to travel on, and ground that will carry her weight—she asks no more. With these and a clear road ahead, she is to abolish distance and revise the world's schedules of time.

'A hundred and twenty miles an hour,' I hear Brennan saying in that sad voice of his. 'Or maybe two hundred. That's a detail.'

In the back of the cab were broad, unglazed windows, through which one could watch the tangle of machinery. Dynamos are bolted to the floor, purring under their shields like comfortable cats; abaft of them a twenty-horse-power Wolseley petrol engine supplies motive-power for everything. And above the dynamos, cased in studded leather, swinging a little in their ordered precession, are the two gyroscopes, the soul of the machine. To them she owes her equilibrium. Of all machines in the world the gyroscope is the simplest, for in its essential form it is no more than a wheel revolving. But a wheel revolving is the vehicle of many physical principles, and the sum of them is that which is known as gyroscopic action. It is seen in the ordinary spinning-top, which stands erect in its capacity of a gyroscope revolving horizontally; the apparatus which holds Brennan's car upright and promises to revolutionise transportation is a top adapted to a new purpose. It is a gyroscope revolving in a perpendicular plane, a steel wheel weighing three-quarters of a ton and spinning at the rate of three thousand revolutions to the minute. Now, the effect of gyroscopic action is to resist any impulse which tends to move the revolving wheel out of the plane in which it revolves. This resistance can be felt in a top; it can be felt much more strongly in the beautiful little gyroscopes of brass and steel which are sold for the scientific demonstration of the laws governing revolving bodies. Such a one, only a few inches in size, will develop a surprising resistance. This resistance increases with the weight of the wheel and the speed at which it moves, till with Brennan's gyroscopes of three-quarters of a ton each, whirling in a vacuum at three thousand revolutions per minute, it would need a weight which would crush the car into the ground to throw them from their upright plane.

The working of Brennan's gyroscope was described at length in the Press on the occasion of the exhibition of his model mono-rail car before the Royal Society and in the grounds of his residence at Gillingham; for a clear understanding of the first full-sized car, it will be well to recapitulate a few of the characteristics of the gyroscope. When Brennan made his early models, he found that while the little cars would remain upright and run along a straight rail, they left the track at the first curve. The gyroscope governed their direction as well as their equilibrium. It was the first check in the evolution of the perfect machine; it lasted over ten years before he found the answer to the problem, ten years of making experimental machines and scrapping them, of filing useless patents, of doubt and persistence. But the answer was found—in the spinning-top. A top set spinning and put down so that it stands at an angle to the floor will right itself; it will rise till it stands upright on the point of equal friction. Brennan's resource, therefore, was to treat his gyroscope as a top. He enclosed it in a case, through which its axles projected, and at each side of the car he built stout brackets reaching forth a few inches below each end of the axle. The result is not difficult to deduce. When the car came to a curve, the centrifugal action tended to throw it outwards; the side of the car that was on the inside of the curve swung up and the bracket touched the axle of the gyroscope. Forthwith, in the manner of its father, the top, the gyroscope tried to stand upright on the bracket; all the weight of it and all its wonderful force was pressed on that side of the car, holding it down against the tendency to rise and capsize. The thing was done; the spinning-top had come to the rescue of its posterity. It only remained to fit a double gyroscope, with the wheels revolving in opposite directions, and, save for engineering details, the mono-rail car was evolved.

Through the window in the back of the cab I was able to watch them at their work. Not the actual gyroscopes, but their cases, quivering with the unimaginable velocity of the great wheels within, turning and tilting accurately to each shifting weight as the men on board moved here and there. Over them were the glass oil-cups, with the opal-green engine-oil flushing through them to feed the bearings. The lubrication is a vital part of the machine; let that fail, and the axles, grinding and red-hot, would eat through the white metal of the bearings as a knife goes through butter. It is a thing that has been foreseen by the inventor; to the lubricating apparatus is affixed a danger-signal that would instantly warn the engineer.

'But,' says Brennan, 'if one broke down, the other gyroscope would hold her up—till ye could run her to a siding, anyway.'

'But supposing the electric apparatus failed?' suggests a reporter, with visions of headlines perhaps. 'Supposing the motor driving the gyroscopes broke down; what then?'

'They'd run for a couple of days with the momentum they've got,' answers the inventor. 'And for two or three hours that 'ud keep her upright by itself.'

On the short track at Gillingham there are no

gradients to show what the car can do in the way of climbing, but here again the inventor is positive. She will run up a slope as steep as one in six, he says. There is no reason to doubt him; the five-foot model which he used to exhibit could climb much steeper inclines, run along a rope stretched six feet above the ground, or remain at rest upon it while the rope was swung to and fro. It would do all these things while carrying a man; and, for my part, I am willing to take Brennan's word.

He, Louis Brennan, was by no means the least interesting feature of the demonstration. He has none of the look of a visionary, this man who has gone to war with time and space; neither had George Stephenson. He is short and thick-set, with a full face and a heavy moustache hiding his mouth, and heavy eyebrows. He is troubled a little with asthma, which makes him somewhat staccato and breathless in speech, and perhaps also accentuates the peculiar plaintive quality of his Irish voice. There is nothing in his appearance to indicate whether he is thirty-five or fifty-five. As a matter of fact, he is two years over the latter age, but a man ripe in life, with that persistence and belief in his work which is to engineers what passion is to a poet. The technicalities of steel and iron come easily off his tongue; they are his native speech, in which he expresses himself most intimately. All his life he has been concerned with machines. He is the inventor of the Brennan steerable torpedo, whose adoption by the Admiralty made him rich and rendered possible the long years of study and experiment which went to the making of the mono-rail car. He has a touch of the rich man's complacency; it does not go ill with his kindly good-humour and his single-hearted pride in his life-work.

It is characteristic, I think, of his honesty of purpose and of the genius which is his driving force that hitherto he has concerned himself with scientific invention somewhat to the exclusion of the commercial aspects of his contrivance. He has had help in money and men from the Government, which likewise placed the torpedo factory at his disposal; and the Governments of India and, of all places, Kashmir have granted him subsidies. Railroad men from all parts of the world have seen his model; but he has not been ardent in the hunt for customers. Perhaps that will not be necessary; the mono-rail car should be its own salesman; but in the meantime it is not amiss that a great inventor should stand aloof from commerce.

But for all the cheerful matter-of-factness of the man, he too has seen visions. There are times when he talks of the future as he hopes it will be, as he means it to be, when 'transportation is civilisation.' Men are to travel then on a single rail in great cars like public halls, two hundred feet long, thirty to forty feet wide, whirling across continents at two hundred miles an hour—from New York to San Francisco between dawn and dawn. Travel is to be no longer uncomfortable; these cars will sweep along with the motion of an ice-yacht, and be equipped like an hotel. They will not jolt over points or strain to mount the track at curves; in each one the weariless gyroscopes will govern an unchanging equilibrium. Trustful Kashmir will advance from its remoteness to a place accessible from anywhere. Tramway lines will no longer be a perplexity to paving authorities and anathema to other traffic; a single rail will be flush with the ground, out of the way of hoofs and tires. Motor-cars will run on two wheels like a bicycle; it is to be a mono-rail world, soothed and assured by the drone of gyroscopes. By that time the patient ingenuity of inventors and engineers will have found the means to run the gyroscopes at a greater speed than is now possible, thus rendering it feasible to use a smaller wheel. It is a dream based on good, solid reasoning, backed by a great inventor's careful calculations. H. G. Wells has given a picture of it in the last of his stories of the future.

Practical railroad men have given to the mono-rail car a sufficiently warm welcome. They have been impressed chiefly by its suitability to the conditions of transportation in the great new countries, as, for instance, on that line of railway which is creeping north from the Zambesi to open up the copper deposits of North-Western Rhodesia, and on through Central Africa to the terminus at Cairo. Just such land as this helped to inspire Brennan. He was a boy when he first saw the endless plains of Australia, and out of that experience grew his first speculations about the future of railway travel. Such lands make positive and clear demands, if ever they are to be exploited for their full value to humanity; they need railways quickly laid and cheaply constructed, lines not too exacting in point of curves and gradients, and, finally, fast travel. It is not difficult to see how valuable the mono-rail would have been in such an emergency as the last Soudan war, when the army dragged a line of railway with it down towards Omdurman. Petrol-driven cars to replace the expensive steam-locomotives, easy rapid transit instead of the laborious crawl through the stifling desert heat—a complete railway installation, swiftly and cheaply called into being, instead of a costly and cumbersome make-shift.

The car went back to her garage, or engine-shed, or stable, or whatever the railway man of the future shall decide to call it. Struts were pulled into position to hold her up, the motors were switched off, and the gyroscopes left to run themselves down in forty-eight hours or so. When the mono-rail comes into general use, explained Brennan, there will be docks for the cars, with low brick walls built to slide under the platforms and take their weight. And while his guests assembled in a store-shed to drink champagne and eat sandwiches, he produced a big, flat book, sumptuously bound, and told us how his patents were being infringed in Germany. On that same day there was an exhibition

of a mono-rail car on the Brennan principle taking place at the Zoological Gardens in Berlin; the book was its catalogue. It was full of imaginative pictures of trains fifty years hence, and thereto was appended sanguine letterpress. While there sounded in our ears the hum of the gyroscopes from the car housed in the rear, I translated one paragraph for him. It was to the effect that one Brennan, an Englishman, had conducted experiments with gyroscopes ten years ago, but the matter had gone no further.

'There, now,' said Brennan.

---

# ONE GENERAL ASSEMBLY—AND AFTER.

## CHAMBERS'S II.

FOUR days of the precious week had gone by—days of bewildering enjoyment to Helen Campbell—each a miniature lifetime in its rich store of experiences.

She had watched from her aunt's carriage the historic procession of the Lord High Commissioner passing through the crowded streets of the gray old town to the Palace of Holyrood, and if her interest had been more concentrated upon one gallant figure on horseback curvetting up and down the line of kilted troops than on the representatives of royalty there was some excuse for her.

Archibald Napier was the hero of every moment of those days. Even when she was sitting on the packed benches of the sombre Assembly Hall, between her father and mother, listening to the weighty logic and profound theological disputations of the most eminent divines of the Scots Church, her traitorous thoughts were with him, speculating as to his whereabouts, recalling words and glances, past intercourse, anticipating future meetings, with always that black moment of annihilation at the end, when the week should be over and her connection with this magic life severed.

But to-day the climax of her enjoyment was to be reached, and she had resolutely put away all thought of the impending doom.

In the afternoon a drive with Archibald round the breezy uplands of Arthur's Seat, and in the evening the High Commissioner's reception at Holyrood Palace. There had been a little demur on the part of the Misses Drummond when the young man suggested the *tête-à-tête* excursion; but he was so frank and natural in his request for Helen's society, pleading that the pony had to be exercised, and it would do them both good to escape for an afternoon from the strenuous events of the week, that they had considered it more politic to yield. He arrived directly after luncheon in his smart little cart, and the pair set off together with a delightful sense of freedom and intimacy in both their hearts that strangely enough kept them silent for the first part of the way.

'This is better than that dull old Assembly Hall,' Archibald said at last, turning to look down at his companion with smiling eyes as they left the narrow streets of the Old Town behind and spun out into the wide expanse of the Queen's Drive.

Helen smiled back at him comprehensively. The fresh breeze had brought a lovely colour into her face, and the simple woollen tam o' shanter pulled down on her fair hair lent a quaint, boyish touch to her beauty that appealed to him strangely.

'I ought not to think so,' she returned; 'but then I don't understand theology,' in a more serious tone.

He laughed aloud.

'You foolish child! What does a woman want with theology? There are other lessons much more important for you to learn,' glancing quickly at her to note the effect of his words.

Her gray eyes had a veiled look as she gazed straight ahead of her, unconscious of the beauty of the profile she turned to him.

'I am a minister's daughter; I must never forget that,' she persisted.

'You are a little Puritan,' he laughed, flicking the pony into a canter.

A troubled look crossed her face at his words. She turned to him.

'You don't think I am a hypocrite, Cousin Archie?' she pleaded.

But he continued to smile tantalisingly, without looking round.

'I am sure you do,' she went on, her distress deepening. 'If you only knew how—how I dread going home,' with a fine impulse of confession. 'It is wicked of me, I know. When we first thought of accepting Aunt Charlotte's invitation they were afraid I might be discontented with Muirton afterwards, and I laughed at them. Now'—— She broke off, glancing fearfully at him to note the effect of her words.

But there was only chivalrous commiseration in his blue eyes as he turned to her.

'Poor child, is it so very dull there?' he asked in a tender voice.

'I used not to think so,' she said, half-shamefacedly. 'I dare say it will be all right again after a time, when—when'—— Again she broke off.

'When you have forgotten us,' he finished for her. 'But I am not going to allow you to do that, Cousin Helen. I am coming up to Muirton in the autumn, and'——

But a little gasp of delight from the girl interrupted him.

'Oh, will you really?' she cried. 'Will you promise?'

'Of course,' he asseverated boldly, then paused,

conscience-struck. A list of his autumn invitations had risen up in his mind to shame him, and according to present arrangements there was not so much as a week-end to spare for Muirton. Besides, was there not every prospect that by that time he might be an engaged man with an autocratic fiancée to account to for his movements? But for to-day, what mattered it? To have brought that radiant look into the beautiful child-face beside him was a temptation few could have resisted. And Helen believed him as if his word were the gospel.

The whole outlook was changed for her now; the dreaded eclipse that had threatened her life had passed harmlessly away. There was to be a continuation, a second chapter, after all. She was much too naïve and unsophisticated to disguise her delight, and for a time her talk was all of Muirton and his promised visit.

They had reached the brow of a steep, upward climb by this time, and as they were proceeding along the higher level of the road that winds round the southern side of Arthur's Seat a motor that had been following silently in their rear flashed by them and disappeared in a cloud of dust. There was an instant's pause while the pony, startled by the apparition, reared up in the shafts, backing the cart towards the narrow parapet that protected the road from the steep of the hillside. Then, with a desperate plunge, the animal started forward in the wake of the motor.

Archie, who had flung his arm across Helen in that instant of peril to keep her in her place, recovered his position. But the words that had escaped his lips unknowingly to himself in the crisis sang in her ears triumphantly through all the mad progress that followed. 'Sweetheart! little sweetheart, sit still!'

The cart, rocking and swaying, dashed onwards from turn to turn of the narrow, winding road. Once or twice the girl cast a side-glance at her companion. The fierce contest between his own will and the terrified brute-strength of the runaway animal had driven the colour from his face; but he was smiling, though with set teeth, and there was a hard, metallic brilliance in the blue eyes such as she had often pictured there in the hour of battle.

Was it not glory enough for her to share this danger with him—her hero? Whatever happened afterwards, nothing could rob her of this triumph. And now there was another uphill gradient before them, and gradually the masterful control on the reins was telling on the frightened animal, and the mad gallop passed to a canter, and then slowed still more, till at the summit of the hill the last effort was made, and the runaway came to a full stop, with heaving chest and spumy flanks.

'Whew! that was a stiff pull!' said Archibald, with the little, half-savage laugh of the conqueror. Then, turning to his companion, 'You weren't frightened?'

Helen met his gaze, a reflection of her late triumph still in her eyes.

'No,' she said, and laughed.

'Plucky child!' he retorted, taking out his handkerchief and passing it carelessly over his heated brow. 'We'll give the pony a moment's breathing-space, and then get home. By the way, I wouldn't say anything about it to the aunts, if I were you. They might be frightened.'

'We needn't tell anybody,' said Helen quietly. Her brain was still dancing with the intoxication of those muttered words; it was all she could do to control herself to speak. Another stage in her development had been reached; the first love-words had been spoken.

'Sweetheart,' he had said.

That was a very different epithet from cousin. It had been surprised from him prematurely, she believed. But she had no experience of the world to tell her how generic even that sacred term can become on a man's lips.

For the remainder of the homeward way little was said by either of them. Only when they reached the door of the great house in Moray Place, and he was helping her to alight, he held her hand in a firm, steady clasp.

'Till to-night then, little cousin,' he said, and, mounting the driving-seat again, drove quickly off without another glance round.

It is said that realisation seldom fulfils anticipation. Helen Campbell would have given the aphorism a flat denial at the end of the first half of that day's programme. The drive with Archie had done far more than fulfil her expectations; it had created a whole new universe of possibilities that were already taking the more definite shape of hopes within her. Unconsciously she looked to the events of the evening to further the transformation.

But so far its happenings had had the reverse effect. The first chill of disillusionment had made itself felt when she entered the great, sombre hall at Holyrood Palace, and saw among the heterogeneous crowd assembled there a scattering of those representatives of the fashionable life of the capital with which her mother had once been familiar. Some essential difference between herself and them struck her at once. There were plenty of those around her bearing the unmistakable stamp of the country cousin had she wished for countenance. But the idea of such a parallel did not present itself to her. They were not there as the favoured friend and cousin of Archibald Napier, to be recognised presently by him before the whole assemblage, and made welcome with his brave, gallant smile. She held her head higher at the thought. The scent of a spray of roses at her breast seemed to rise up and encourage her. They were a present from her cousin, sent at the last moment as she was dressing, and their arrival had put the finishing touch to her excitement.

'It's a sin and a shame that her aunts should let her go in such a dress to her first party,' had been the mental comment of Miss Drummond's maid,

who had helped to fasten the flowers into their place.

But at that time Helen had been happily oblivious of the deficiencies in her attire. Her faith in her cousin was too implicit to allow any doubt as to the nature of his regard for her. He knew all about her circumstances: the simple manse, the unsophisticated life, the lack of this world's goods, yet the knowledge had had no deterring effect upon him.

'Archibald will be too busy to attend to us to-night,' Mary Campbell had ventured to say by way of warning before they started, her maternal fears awakened. 'He is to be on duty, you know.'

'Yes, he told me,' Helen retorted quietly; but she had smiled to herself as she spoke. How could her mother know of those last fervently uttered words, 'Till to-night then, little cousin'?

And now the evening had come, and so far she had only caught one glimpse of her hero. He had been standing among the brilliant suite gathered around the Lord High Commissioner in the Throne Room when her turn came to be presented, looking to her eyes far the most gallant figure of them all in the glory of his Highland dress. But apparently he had not seen her; his blue eyes, smiling and indifferent, had been gazing over her head. There was a set expression on his face.

'He is on duty,' Helen had told herself, as she joined the little group waiting for her in the farther room.

'Did you see Archie?' were her aunt's first words. 'He was standing next Lady Jean Dalrymple, and very pretty she looked!'

'Yes, I saw him,' said the girl. 'I did not notice who was next him.'

She had hardly recognised her own voice as she spoke. It seemed so strange and far away.

'The child is quite pale with excitement,' laughed Miss Drummond, turning to Mary Campbell; but there was only a faint answering smile on the mother's face. The fears and apprehensions that had been growing steadily within her during these days in Edinburgh had taken definite shape at last, and she was woeful for the consequences she foresaw to her daughter's happiness.

'We must wander about for another hour, I am afraid,' went on Miss Drummond in a tone of scarcely veiled resignation. 'I did not order the carriage till ten-thirty.'

She was finding the evening a very tedious affair herself, though she strove to conceal her boredom. Certainly Effie had the best of it at home.

'Till to-night then, little cousin.' Had he really spoken the words, or had she dreamt them? Helen was beginning to wonder.

Somewhere in the distance a band was playing, and the impetuous bursts of music wafted every now and then to her ears above the babel of tongues seemed to stir up a sort of panic within her which her loyalty strove to combat.

No, she would not lose faith. The evening was not over yet; sooner or later he would escape, if only for a moment, and seek her out. She glanced down, as if for encouragement, to the roses at her breast; but already they were fading. Had Jean Dalrymple such beautiful flowers? she wondered, startled the next moment by the sharp stab of jealousy the thought occasioned her.

Their wanderings had brought them to a long picture gallery, with seats placed at intervals on either side, once perhaps the rendezvous of royal lovers. What secrets could its walls not unfold! But Helen's mind was too centred on her own affairs to be conscious of the historic atmosphere; only her mother had a quaint connotation of the hapless queen, induced perhaps by a realisation of her daughter's plight.

'Let us sit down somewhere,' she said in her quiet voice.

Miss Drummond had drifted away with a passing acquaintance, leaving the three alone.

They ensconced themselves in a windowed recess overlooking the wide pleasance in front of the Palace. Down below, through the darkness, was an ever-shifting procession of lights as the rows of cabs and carriages moved silently this way and that. Higher still were the lamps of the Old Town, rising in slow gradation to the dark terminus of the Castle rock.

Helen, gazing out, could hardly believe that they were the same streets she had passed through with Archie that very afternoon so full of joy and excitement; or, rather, was she the same person?

A stir of commotion at the other end of the gallery at this moment drew her attention away from the window. A brilliant little official group was advancing towards them down the long corridor.

'It is the Lord High Commissioner and Lady Dalrymple,' whispered the minister.

On each side the people rose as they passed, and either bowed or curtsied.

The marchioness was smiling graciously; the Commissioner, soldierly and erect beside her, his breast ablaze with orders. Behind them came a slim brunette, whose vivacious face was turned laughingly to her companion, Archibald Napier. The swish of her silken skirts as she passed seemed to express her utter indifference to the people around her. She had no official obligation in recognising them as had her parents, and was therefore free to enjoy herself in her own way.

Archibald's whole air gave the same impression of irresponsible enjoyment. He was no longer on duty; that was evident in a flash. Yet as he turned for an instant and met the gaze of a pair of luminous eyes gleaming out of a girl's pale face in the window he glanced quickly away again.

'Let us go home,' said Helen Campbell in a queer, lifeless voice to her mother.

'Yes, let us go,' echoed the minister grimly.

A few minutes later they were overtaken by Miss Drummond.

'They are dancing in the big hall,' she said. 'Helen, would you care to watch them for a little? Archie was waltzing gaily with Jean Dalrymple when I left.'

But Helen shook her head. 'I would rather go home,' she said.

*(To be continued.)*

# A MEMORY OF ST ANDREWS.

By Henry H. Brown.

IN an exhibition of the Royal Scottish Academy towards the end of the 'seventies there was a picture which greatly interested me, and of which thirty years later I retain a clear recollection. A tall, majestic man, clad as a prince of the Roman Church, was standing in a dimly lighted room. His face and parts of his scarlet vesture were illuminated by flames which were darting beneath the door. The artist, with much skill, had allowed the observer's imagination to fill in the details; but it was obvious that the cardinal was at bay, that only a wooden door intervened between him and some deadly peril, and that the door was being slowly destroyed. His feelings in these appalling circumstances had left their impress on his features. One recognised stern resolve, hatred and scorn towards his enemies, pride, something of the bitterness of death, but no trace of fear. The picture, of course, represented the penultimate stage of the assassination of Cardinal Beaton at St Andrews on 29th May 1546, a crime which is correctly characterised in lines attributed to Sir David Lyndsay:

> As for this cardinal, I grant
> He was a man we might well want,
> God will forgive it soon;
> But of a truth, the sooth to say,
> Altho' the loon be well away,
> The fact was foully done.

As the circumstances of the assassination are recalled, the ease and simplicity with which it was accompliahed add to its horror. No obstacle was placed in the way of the perpetrators; no hand was raised to help the victim. In the early hours of a bright summer morning less than a score of armed men assembled by twos and threes in the precincts of the cathedral. The leaders were well-known Fife gentlemen—Norman Leslie of Rothes; his uncle, John Leslie; William Kirkaldy, younger, of Grange; James Melvin or Melville of Carnbee; and Peter Carmichael of Balmaddie. So soon as the drowsy porter lowered the drawbridge of the neighbouring castle to admit workmen and materials, the conspirators, by a few at a time, made their way into the inner court. The porter was quickly overpowered—some say he was slain and his body thrown into the ditch—and the keys were secured. With the utmost coolness the workmen and domestics were expelled, the portcullis was dropped, and all exits were guarded. It was some time before Cardinal Beaton became aware that his residence was in the hands of his enemies; but when he discovered this he retreated with a single attendant to his chamber and barred the door. John Leslie began to parley with him, and tried to induce him to open to them, making a half-promise that if he did so they might spare his life. The cardinal declined to be tricked, and as the solid oak door was too strong to be forced, fire was brought to consume it.

This is the stage which the artist chose to depict. It was grimly tragic: a determined man within, his implacable foes without, and between them a burning door. It will never be known what were the thoughts and feelings of Cardinal Beaton during this awful pause. His memory might well recall a day, only two months past, when George Wishart was burned before the walls of the castle, and when he had gazed with triumph on the sufferings of the martyr. He might remember that on that day the flames of the faggots lit up his chamber just as the flames of the burning door were now glancing on the polished furniture. He could not have forgotten the words in which the martyr foretold for the prelate an early and miserable death, nor could he doubt that the prophecy was about to be fulfilled; yet his reflections seem only to have dispelled fear, and to have nerved him to meet death with the same firmness as Wishart. Inspired with this resolution, he ordered his attendant to open the door and freely admit his assailants. Like Becket on a similar occasion, he reminded them of his sacred office and of the sacrilege involved in killing a priest; but, like the four Norman knights at Canterbury, Leslie and his companions cared for none of these things. Two rushed at him in violent passion, striking at him with their weapons. Melvin, however, rebuked their haste, pushed them aside, and addressed the cardinal. This address, as preserved by Knox, is probably as authentic as the long speeches in Livy; but it is interesting as showing what was then deemed the proper form of words for use on such an occasion: 'Repent thee of thy former wicked life,' he said, 'but especially of the shedding of the blood of that notable instrument of God, Master George Wishart, which, albeit the flame of fire consumed before men, yet cries it a vengeance upon thee, and we from God are sent to revenge it. For here before my God I protest that neither hatred of thy person, the love of thy riches, nor the fear of any trouble thou

could have done to me in particular, moved nor moves me to strike thee, but only because thou hast been and remainest an obstinate enemy against Christ Jesus and His holy evangel.' With these words he ran his sword two or three times through the cardinal's body and killed him. Such were, according to Knox, 'the godly fact and words of James Melvin.' We are reminded of the inscription on the tombstone which, in the fresh remembrance of the scene on Magus Muir, declared that Hackston of Rathillet died for adhering to the Word of God.

By this time a clamorous mob had gathered before the castle demanding to see Cardinal Beaton. The assassins in derision hung out the mangled body in a sheet from the window, exclaiming, 'There is your god; now that you are satisfied, get home to your houses.' It is not necessary to defile this page with an account of the shameful and disgusting indignities afterwards heaped upon the inanimate clay.

It is often said that the assassination of Cardinal Beaton was designed to avenge the martyrdom of Wishart. This is not quite true. With the possible exception of Melvin, who was a personal friend of the martyr, all the leaders were at enmity with the cardinal, and the crime was in the main an act of private vengeance. It is more than likely that the recollection of this circumstance induced Hackston of Rathillet, more than a century later, to stand aside at the murder of Archbishop Sharp, lest his known quarrel with the victim might 'mar the glory of the action, and cause it to be imputed to private revenge.'

The prime mover in the assassination was Norman Leslie, commonly called the Master of Rothes, who was neither a bad man nor a coward, as his conduct in this affair might suggest. He was, in fact, a brave soldier who distinguished himself in the service of his country, and then, like a later Quentin Durward, offered his sword to Henry II. of France. He was one of the most famous Scots who have gained for themselves a name on foreign battlefields. What led him into this crime was a transaction entered into with Cardinal Beaton regarding certain lands at East Wemyss, in which the latter had undertaken obligations which he was by no means willing to fulfil. Leslie demanded implement; the cardinal refused. A quarrel thus arose; and since in striving with a man of the cardinal's temper, as in fighting with a lion, it is better to strike the first blow, and to make sure that the stroke is fatal, Leslie devised the plot for his assassination, which was so ruthlessly executed.

Of the character of the victim there may be more than one opinion. He was a man of dignified appearance, with aristocratic features marred by an expression of cynicism and insincerity. He had little learning and less morality. He was haughty, intolerant, and ambitious. But, again, he had great talents, was a profound politician, had a thorough knowledge of the leading men of the time, and was not lacking in strong patriotic feeling. If it is true that it was at his suggestion that James V. instituted the Court of Session, there is one act at least for which he merits the thanks of Scotsmen. He possessed unyielding determination and unflinching courage, but his firmness and boldness merely hastened the downfall of the Church he revered. The time was past when the spread of the reformed doctrines could be checked by burnings and tortures. Instead of carrying on a furious persecution he might have made for the Church friends of the mammon of unrighteousness by a judicious distribution of lands amongst the great barons, retaining the tithes for the support of the clergy. This course at least held out a hope of success. The burning of heretics was hopeless.

There may thus be differences of opinion as to the character and policy of the victim; there is none as to the nature of the crime. It was a foul deed, and a useless one. It is an example of the truth repeatedly illustrated in history that the removal by violence of an opponent of a cause never benefits that cause. The argument that the taking away of an obstacle by any means is bound to facilitate progress is a specious one, but it is as false in expediency as it is wrong in ethics. A political or religious assassination always produces revulsion of feeling and reaction. It alienates many who are wavering, and whose leaning towards the opinions of the doers is overcome by abhorrence of their deed. The murder of Archbishop Sharp did great harm to the cause of the Covenanters; the assassination of Cardinal Beaton retarded the Scottish Reformation. The effects are equally disastrous to those implicated in the crime. They may feel no remorse at first, and may neither repent of their act nor regret it, yet it leaves a burden upon them which grows heavier as the years pass by. When the Master of Rothes lay dying on the field of Cambray the piteous cry of Cardinal Beaton may have again echoed in his ears, 'I must have Norman Leslie; *he is my friend!*' and he may have at last realised that the doings of that fatal May morning had blotted the record of his distinguished career and placed upon his forehead the brand of Cain.

## NATURE'S CALMING INFLUENCE.

Tossing on pillows thro' the weary night,
I could not sleep; I could not even lie:
Miserable! 'twould seem relief to die,
And so defeat *Insomnia's* cruel might.
I rose, and went abroad into the light.
Around my temples played the freshening air;
The east was all afire, and everywhere
Nature, like happy maiden, laughed outright.
Flowers exhaled their scents upon my way;
Birds woke the echoes with their songs of love,
Thrilled with the freedom of the fields and grove.
Glory of dewy green and white of May
Gladdening my inner eye, morn's witch'ries wound
Their spells about me, and sweet rest I found.

# THE HEART OF THINGS.

By Henry Leach.

'London, *Yesterday*.

HAVE not the smallest molecule of faith in aerial navigation other than ballooning, or of expectation of good results from any of the trials we hear of. So you will understand that I would not care to be a member of the Aeronautical Society.' One of the greatest scientists of the time, the late Lord Kelvin, wrote a letter embracing these sentences to Colonel Baden Powell in 1896; and such a pronounced disbelief in the scientific possibilities of aviation, as we have come to call it, expressed by a man who was qualified in some considerable way to be an authority upon the future, serves to impress upon us once again the magnitude of the work and the achievement which has been accomplished in this field in recent times, marking a rate of advance that has never been approached in any department before. In these days we proceed from the apparently impossible through a series of rapid changes to the complete realisation in the space of a few months or even weeks. We compress an old-time decade into a modern fortnight. In the summer-time last year the present writer was crossing the English Channel on his way to France the day before Blériot crossed it in the opposite direction on his aeroplane. People even then said that crossing the Channel as a daring and most uncertain feat was one thing, but that what might be called practical flying was quite another. But a few weeks since he who writes saw a man (Rougier) and his machine flying round and round about the bay at Monte Carlo in the most perfect and complete command of all his movements in the air, though he was only doing what probably a score of others could have done at the same time. Yet, with all our knowledge of what had been accomplished, and the advantage of the full descriptions of the flying performances that now appear in the papers daily, it is nevertheless a magnificent, a deeply thrilling sight to see for the first time a human being manœuvring his aeroplane in the air. It makes one feel that there is a change in the world, that the evolution of man has gone a long way forward all at once, and that he has become such a despot in the whole scheme of creation as we had never imagined he would be. And then one falls to uneasy and fruitless speculations as to where it all will end. Even in 1904, when the problems of the air were being tackled in a manner more serious and determined than ever before, Lord Kelvin declared that 'the day is a long way off when we shall see human beings soaring around like birds.' But if he had only lived for a year and a half longer than he did he might have seen it for himself, for in less than that time Blériot crossed from France to England on his aerial machine. There was every excuse for Lord Kelvin; but he was one of the most conservative of scientists, and he was often out of touch with the scientific inspirations of his time. That much may be said without the slightest disrespect to his magnificent achievements, which need no monument; and it may be added that many of the limitations which he imposed on his beliefs and ideas were such as would gain for him the sympathy of those who have the best interests of the human kind at heart. It does not frequently happen in these days that the deeply penetrating scientist is at the same time a strongly religious man; but Lord Kelvin was that, and he scouted the idea that science gave any countenance to Atheism, while at the same time he disliked Ritualism as much as Spiritualism, and observed that the 'High' Church was high only in the sense that game was said to be 'high'—meaning that it was decomposing. Such things as these are very well brought out in the biography of Lord Kelvin by Professor Silvanus P. Thompson, which has recently been published in two volumes that are most entertaining. These are the days of biographies of everybody who ever was anybody, and generally speaking they are a form of literature that is as valuable as it is interesting to the average reader who can give a thought to anything else than the abounding

[*All Rights Reserved.*]

fiction. Yet such a one as this was not an easy one to make at the same time both interesting and adequate; and Professor Thompson—who of course had exceptional qualifications for the task—is to be congratulated on the fact that he has succeeded where almost all others would have failed, and has produced a work which stands out from the majority of its class as one of very special and enduring value.

* * *

Lord Kelvin's scientific objects, ambitions, studies, were of an exceptionally practical character. Of course, in a sense, all scientific ambitions are practical; but those of this great man were specially so, and for the reason that for the most part he only strained forward to that which intuitively or by reason he felt to be within his reach. That is one chief reason why he has so much solid, valuable achievement to the credit of his name, why so much of the real progress that was made in his time is accounted to him exclusively. However, what may be called the practical side of this biography, the record of what he did and how he did it, may be overlooked in the present instance in favour of the lighter side, the relation of anecdote and of views upon him and by him. It happens most frequently, or so we are led to believe by the stories that are handed down to us, that the real genius shows little sign of his future greatness in his early youth, but bursts upon the world more or less suddenly and to its great surprise in after-years. But William Thomson—which was, of course, his name to begin with—was from the first remarkable. By going to college when he was only ten and a quarter years old he improved upon the famous record of Cardinal Wolsey; and after winning all the prizes that were to be won he went to Cambridge at sixteen, and a few days after his arrival there he was already spoken of as a likely Senior Wrangler. In the end he was only second; but that was admittedly because the man who gained the first place was less of an enthusiastic mathematician and more of a sober mechanical adept in tackling examination-papers, one who was less interested in the questions set him for what the problems implied than for the number of marks they would gain for him by their satisfactory solution. Thomson himself explained rather ruefully that in the problem-paper he spent his time and energies on one problem in which he was interested, having reference to the movement of a gyrating top on an inclined plane, and had not sufficient time left in which to deal with a paper which, to use his own words, he 'could have walked through.' But one of the examiners who set the papers remarked to Blackall, his colleague, 'You and I are just about fit to mend his pens!' In the course of his after-career it was all science with him and hardly anything but science, and it was often remarked that he saw mathematics in all things and all things in mathematics. Of course he had his special tastes in the matter of relaxation, but he did not permit them to occupy any considerable share of his time. He was a great lover of music, with strong preferences in regard to it, being very fond of Beethoven and a hater of Wagner, while he seemed to regard the case of Strauss as so very bad that he looked upon him more in sorrow than in anger. But on the point of the mathematics being always in his mind, of his almost seeming to consider how the natural laws were affecting his getting of the change for a shilling, some curious tales are told. Thus in the Memoirs of Sir George Stokes it is written: 'Lord Kelvin's visits were occasions of enjoyment to him, and great were the discussions between them, which anything served to begin. For instance, the eggs were always boiled in an egg-boiler on the table, and Lord Kelvin would wish to boil them by mathematical rule and economy of fuel, with preliminary measurement by the millimetre scale, and so on.' And we are told by Professor Thompson that in announcing a welcome piece of intelligence at the close of the dinner to Virchow in 1893 Lord Kelvin said, 'Gentlemen, the reduction of cellular tissue to free chemical molecules may now commence—in other words, you may now smoke.' Again, when proposing the health of Admiral Colomb on one occasion, he said, 'Admiral Colomb has done duty all over what the mathematicians would call the "great equipotential," or, in plain language, the *ingens æquor*.' Plain language! Thus it is seen that for all his 'seeing mathematics in everything' there was nothing that was dull in this scientist, but that he had a keen sense of humour; and all those who had the privilege of his friendship or acquaintance found in him the most lovable of companions. He was only a young man when Thackeray first met him. The two were introduced to each other by Dr John Brown, who afterwards wrote to Mrs Thomson's youngest sister, Miss Jessie Crum: 'Thackeray was delighted with your William Thomson; he said he was an angel, and better, and must have wings under his flannel waistcoat. I said he had, for I had seen them!' And after one of the great controversies between him and Huxley, the latter wrote: 'I may be permitted to say of him as the old poet says of Lancelot:

> Gentler knight
> There never broke a lance.'

This book is a record of the work of one of the greatest minds of the last century, and the story of a career of indomitable energy and resolution. It is very well worth the reading.

* * *

A curious and interesting question, and one which may be said to be of some importance concerning the habits of business men in the City of London, has lately been put forward: Do they drink too much during business hours? There are strange tales told of the way in which City men 'carried on' in the olden time, of the more than a bottle or even two bottles of wine that they would consume

at their midday meal, and of their complete incapacity thereafter for attending to the smallest details of their affairs until the following morning. These habits, we may be well sure, have long since passed away; but it happened the other day that when an inquest had to be held on a City man who had come by a sudden death, it was said he belonged to a certain Exchange—which was shown afterwards to be untrue; and it was also declared at the inquest that the drinking of a certain amount of whisky was a necessary part of the carrying out of transactions on this and some other Exchanges. There is a very great difference between such drinking and the ways of those ancestors of the City men who have been referred to; but still even this suggested necessary refreshing was also indignantly denied. The City, on defence for its habits, urged through the lips of many good authorities, and with some warmth, that it was never a soberer City than it is at the present time, and that its tendency is to become soberer and soberer all the time. It is declared, indeed, that in this respect most remarkable progress has been made in a very short period recently, for that, in so far as the Stock Exchange is concerned, while, when large sums were made by many members almost every day during the Kaffir boom of 1895, some thousands of bottles of champagne were consumed by way of celebrating the various *coups* that were effected during the hours of business, the state of affairs during the rubber boom which has been in progress lately, and in the course of which some excellent business has been done, has been that there has been no extra drinking, and so we are solemnly assured, and are glad for the assurance, that 'the habits of City men have changed, and changed for the better.' In the same way the managers of some of the leading restaurants in the City to which these men of business do most resort during the luncheon-hour declare—perhaps not without a tinge of regret—that a constantly increasing number of their customers drink only mineral water with their meals. The unyielding critics of these City people might quite likely put forward the suggestion that for several recent years times have not been at all good on 'Change, and that when at last the rubber boom came to help them the profits that accrued were needed for other purposes than the purchase of wines and liquors. It will need more than one boom to bring about any considerable superfluity in the pockets of many of these people who have had such rich times in the past, for the public do not deal on the Stock Exchange by way of speculation in the way that they used to do. They have been taught many severe lessons, and not all the wiles of the House will attract them back again. However, no matter. Let the City have full credit for its reformation, from which it no doubt feels that it derives a considerable physical and pecuniary benefit. Nevertheless it might be difficult to persuade some of those who walk about the City occasionally, and look into the places that are frequented by leading men of business, that it is by any means so completely lacking in self-indulgence as some of its advocates will hint; and those who do thus pry, and are perhaps inclined too hastily to connect cause with effect, might suggest that there is no ground for complaint of decreasing business and the difficulty of meeting foreign competition while so much time is laid to waste by partners in concerns, during which the management of their affairs is left to deputies.

* * *

There is a certain class of large restaurant which exists almost solely for these leading men of business, and is kept open only for four or five hours during the day. It is generally approached down an alley, or has some other means of entrance which makes no advertisement of itself. It is a class of house that has to be found out and known, where the customers are regular and of long standing, and almost as if they were the members of a club together; and in such places the stranger feels a little uncomfortable, and is oftentimes treated with some specially hopeful sympathy by the waiters, who know the faces and the names of the regular patrons almost as well as they know those of their own family. Here on every day but Saturday and Sunday you may see the business men of means and position lunching in a manner that indicates that everything in the world is very well indeed so far as they are concerned, as in most cases it probably is. They take no small quantity of wine for their lunch, and then the coffee and the liqueurs and cigars are wheeled along, and some time later more liqueurs and cigars, and so the time is spent until three o'clock or after, and then just a short visit is paid to the office to sign letters and see that 'everything is going on all right,' and so home. This is not a matter of hearsay, but the result of personal observation on scores of occasions; nor does it concern but a few groups of people, but thousands of them. It may be said, then, that surely those who are doing well have the right to do as they please; that some allowances must be made for human nature; that life was never meant to be all work and no play; that the City is the City after all, and has its own ways which are not to be compared to those of a provincial town, where there is less money and less habit and tradition, and so on—arguments which are quite unanswerable in a way, especially in the matter of tradition. But whenever it is added that it is just the same in other large capitals, that has to be denied. It is not the same in New York, for instance. The average prosperous man of business in New York cuts far less time to waste than the average man in the City of London. Probably he works more hours; but if he does not do that, he certainly gets through far more work during the period that he is supposed to be attending to his affairs. He has an afternoon session, which in a large proportion of cases the Londoner has not. The man of business

in our great Metropolis who is so situated that he is in command of his own time, and goes home at five or six o'clock, pretending that he is weary with his efforts of the day in the direction of commerce, is, in a large proportion of cases, a very considerable humbug, and again he is so when he takes but a very modest dinner, and desires some credit to be given to him for his abstemiousness. The men who lunch from one o'clock to three in the manner aforesaid do not generally need much more sustenance during the remainder of the day. Of course one is not so foolish as to suggest that there is anything approaching to universality in this sort of thing; but we point to a type, and to a type that is very common indeed. There are as hard workers in the City as elsewhere; but any one who made close observation upon it for a long period would have great difficulty in coming to the conclusion that it overworked itself, or in believing that the methods of this very numerous type are those which built up the commercial greatness of London and the country. Rather would such an observer put it to himself that the men of the type were having their good time, as they may think it, because of the industry of their grandfathers long departed.

* * *

The really bad feature of the thing is that it is not a good example, and its bad effects are clear. The young man of the City who is in a subordinate position is more inclined to laziness than he has ever been. Watch him in many places all through the working day, and it is impossible to imagine that one in a hundred of him is even a most dimly possible Lord Mayor. He often enough looks forward to his day chiefly for the enjoyment that it will give him in the companionship of those like himself in underground meeting-places, where they drink tea and coffee, smoke cigarettes, and play dominoes. There is this domino-playing to the very last minute of the luncheon interval, and in the middle of the afternoon there is a concerted rush again into these subterranean, smoke-filled chambers for some further participation in the game. No casual visitor to London City can fail to be impressed with this feature of the life that is lived there; and in this case the type is a far larger proportion of the whole than in the other case, and it is fast on the increase. And those who will make excuses for everything will say that after all there is not much harm in tea and dominoes, and young men may have very much worse habits. Very well. But there are more idle apprentices in the City of London now than ever there were, and, be it said with confidence, there is more dominoes played between 3.45 and 4.30 in this place than anywhere else in two days or even perhaps a week. As a whole, the City is no doubt an intensely busy place. Men work there at feverish heat; great projects are carried through in a rush; there is a fierce strain of competition and fight; and the outsider gets the impression of all this from the hurrying crowds, from the noise and bustle of traffic, from the appearance of all men being in great haste and having an intense desire to do the best for themselves. But appearances are to some extent deceptive, and the City is not nearly so busy as it looks—not anywhere nearly so busy. Man for man, the Londoner of the one square mile does not work at all so hard as he of Glasgow or Manchester or Liverpool. But, of course, it is a very great and wonderful City, and its people are wonderful too.

# LAURISTONS.

### CHAPTER XXXVIII.—HOW JACK BECAME KNIGHT-ERRANT.

AND so it came about that next day Jack Sax, deep in his books and figures, was surprised by a sudden summons to Sir Charles's private room. He slipped off his stool with a perfectly easy conscience and small thought of all that lay between him and it before their acquaintance should be renewed.

In the private office he found Sir Charles and his grandfather awaiting him with burdened faces.

'Jack,' said Sir Charles when the door was closed, 'your father gave his life for mine on Dunkirk sands. Is his son prepared to risk his life for a Lauriston again?'

The only Lauriston Jack considered likely to be in any serious trouble was Charlie. He could not imagine what it could be, but he was ready to do anything he could to get him out of it.

'I'm ready, sir. Is it Charlie?'

'No, my boy. It's Mavie.'

'Miss Mavie!' jerked Jack in amazement.

'Mavie and her mother. We fear that if Mavie is not got home we may lose her mother. The anxiety is wearing her out. I want you to get into France and bring Mavie home, by hook or by crook; only—bring her.'

'I'm ready, sir;' and a very fine specimen of straight, clean-made, healthy-inside-and-out young British bulldog he looked, as he stood there with a deep glow in his eyes and a fine colour in his face.

'It is a great charge I entrust you with, my boy,' said Sir Charles gravely, as he laid one hand on Jack's shoulder, which was about on a level with his own now. 'I do not know any other in whom I could place so much confidence. I doubt even if Charlie could carry such a matter through as well as I hope you may succeed in doing. He is too impetuous, and, besides, he is all in pieces at present.'

Jack jerked up his brows in surprise. He had not heard.

'He's had a nasty fall with the hounds, and won't be able to move for weeks. I will only ask of you, Jack, to do your very utmost to bring her home. I fear her mother's life depends on it.' And he looked into the boy's clear eyes.

And Jack looked back into the deeps of trouble in his, and said simply, 'I will do it, sir, if it can be done. When can I start?'

'The sooner the better. Take as little as possible. If you get safely across you must rig out as a Frenchman. You understand you will have to steal her away. Bonaparte is said to be in Austria, so the strings may be somewhat loosed in Paris. You can have all the money you can carry. Better buy a body-belt and wear it next your skin. We will line it with French bank-notes—they will be the lightest; and you will take some French gold for your immediate needs. Go straight home now and get together what you require. Book a seat on the Brighton coach for to-morrow morning as you pass the "Golden Cross." As to your business, say nothing to anybody. I will call at Queen Street this evening and give you my ideas as to getting across and back again. I trust you, my boy, to do your best.'

'I will, sir.' And he turned and went.

Not a boy of many words, you perceive; quicker of thought than when he suffered reproof at Mavie's hands for lack of imagination in the matter of Red Indians on Brent-side, but just as matter-of-fact and common-sensed as then, and given now to fairly speedy conclusions and prompt action thereupon. But, above all, a lad whose frank face and honest eyes inclined you to most perfect confidence, not only in his good faith, but in his ability also. Many of his contemporaries in the bank could beat him at figures in point of speed, but those above him came in time to appreciate this outstanding fact, that whereas the others made mistakes now and again, what Jack Sax did he did, and there was never any need to check it. In two words, he was straight and he was thorough.

And so he was speeding along to the Golden Cross Hotel as the first stage towards the rescue of Mavie Lauriston. And if his head was in somewhat of a whirl and his heart somewhere up in the clouds—well, where would yours have been in like case, my friend, supposing you were nineteen, and had not seen your dream-lady for two years, and she in dire distress, and you ordered off to the rescue?

'From Brighton,' said Sir Charles when they got to discussion of detailed plans that night, 'you will make your way to Newhaven, and inquire at the "King George" for a smuggler named Paul Lebon. If he is there he will take you across to Honfleur. If he is expected shortly, you will have to decide yourself whether you will wait or try elsewhere. But above all things, my boy, keep clear of the press-gangs. They have no mercy. If you fall into their clutches you will never get Mavie home. You have got a belt? Here are twenty French notes of five hundred francs each, and here are one hundred louis. Stow all these in the belt, and take these twenty guineas in your purse for use on this side. And God grant us a successful issue!'

'I will do my very best, sir.'

'I know you will, Jack, for all our sakes. I trust you completely.'

---

## CHAPTER XXXIX.

### HOW JACK FELL INTO GOOD HANDS.

THERE was no difficulty in finding the 'King George' at Newhaven. But when Jack whispered into the landlord's ear an inquiry after Paul Lebon, that worthy, from a somewhat knowing man of the world, well informed and quite ready for a chat, became of a sudden as dense and simple as any yokel of the country-side, and suspicious beyond even the capacities of his new character. He had never heard the name, and could not even pronounce it correctly.

'I only want his help,' said Jack.

But the rubicund one smelt Excise, and had never heard of any such person in those parts.

So Jack took a stroll among the fishermen, and laid out a judicious sum by way of tongue-looser among them at another house, and learned several things of moment—among others, that trade was bad, and that very few French boats were coming that way at present, because the Channel was full of warships and the risks were too great. The only people doing any business at present were the Guernsey men, and they went farther west, Poole and Weymouth way, where the waters were wider and less patrolled. And how could he get to Poole or Weymouth? It was a cross-country journey, beset with difficulties if the coast towns and their dangers were to be avoided. What about running one round the Isle of Wight in a smack? Well, that could be done for a consideration. There was always the risk of running across a king's ship and being hauled aboard and trapped. They took little account of 'protections' when men were wanted. Still, it might be done in the night. How much? Ten guineas—after much discussion—to be paid beforehand and left with the wives in case of accident. And five o'clock that afternoon found him running down-Channel with a brisk wind aboard the smack *Mary*, Tom Bone master.

They kept a good offing and a sharp lookout as long as daylight lasted, saw the lights of Portsmouth —'Wouldn't go in there to fetch a thousand pounds,' said Bone tersely—stole with their hearts in their mouths past a great man-o'-war beating up from Portland way, and crept into Poole harbour about six o'clock the next morning.

'Keep your eyes skinned for the gangs, mate,' was Master Bone's parting word of advice, as Jack

leaped out on to the sand; and they put off, to lie hidden on Brownsea Island till sundown.

Here he found himself in luck. Inquiring cautiously at the first water-side inn he came to as to the prospect of getting across to the islands, he was introduced to a stalwart Guernseyman, Daniel Martin of St Peter Port, in high good humour at the accomplishment of a successful run, and returning to Guernsey that very night.

When Jack spoke understandable French to him he fell upon his neck and was completely at his service. He took him aboard his *chasse-marée* at once, and cleared out a bunk for him, and Jack stretched himself in it with great content, and only woke up, with still greater content and a mighty appetite, when the motion of the boat told him that the next stage of his journey towards Mavie was fairly in progress.

Martin found him food, and he sat eating it alongside the jovial steersman as they ran past bosky Brownsea and cut through what Martin called the *goulet* to the open sea, just as the setting sun set the long stretch of sandy cliffs aflame.

He questioned the jovial one as to means of getting across to France, and Martin in turn did his best to get out of him what he wanted in France, where, *ma foi!* they had less liberty than ever, it was said, since Bonaparte had made himself Emperor.

'It's we in the islands that have the liberty,' he said. 'And I'd like to see the king's ship that would dare come into Peter Port and rake it over for sailors as they do in this poor England of yours. Why, no man is safe nowadays across there,' with a backward jerk of the shoulder.

But all he could get out of his passenger was that he had business over there, and hoped soon to be coming back this same way; and if M. Martin was coming across he would ask no better than to come with him. A sentiment of which M. Martin was pleased to express his hearty approval.

And where might he be wanting to go to in France?

To Paris. Ah, then he would recommend getting to the coast of Normandy, say by Surtainville. Roscoff in Brittany would not be difficult. They were doing a big free-trade business down there, but it would be out of the way.

And how could he get across to Normandy?

Easy enough. If none of their Peter Port boats were going, some of the Sark men would put him over—George Hamon or some of them. A good man, George Hamon, gone out of the free-trading since he got married, indeed, but always open to a passenger-job either to or from France or England.

It was past midnight when Jack's straining eyes caught a twinkle of light in the eastern darkness.

'Casquets,' said Martin briefly, and then, having weathered that danger-point, he surrendered the helm to another and went below to sleep.

But after his all-day nap Jack felt no desire for sleep. The novelty of his surroundings and the wonder of the quest he was upon kept his brain far too busy. If his quest were not to be an everlasting reproach and the missed opportunity of his life he must ensure it a successful issue.

He tried his best to follow out the possible lines of his journey, but for a boy who had never been outside England in his life that was no easy matter. He saw the uselessness of planning on so insufficient a basis, and gave it up at last, determined to get through somehow on his knowledge of the French language and his plain English common-sense.

What was that bold lump of an island over there? 'Why, Herm,' growled the steersman, who was beginning to feel sleepy. And that behind it? 'Sercq.' And this right ahead? 'Guernsey.' And they slipped down Little Russel and into Peter Port harbour just as the rising sun was setting the window-panes aflame.

*(To be continued.)*

---

# THE LAND OF A THOUSAND DAYS.

## THE FAYUM DISTRICT OF EGYPT.

By Douglas Sladen.

EW visitors to Egypt except sportsmen go to the Fayum, though the railway takes you direct to its ancient capital, Medinet Fayum, in about three hours from Cairo, and it is one of the most beautiful, most purely native, and most mysterious parts of Egypt.

In the Fayum you meet no Europeans except a stray Greek; there are only Egyptians (very Arab Egyptians) and Syrians. The return of the Hadji here is not robbed of its antique pageantry; the pavilions for their reception, the processions of chanting torch-bearers, belong to the age of the Caliphs; the streets are full of basket-weavers whose toes are as useful as their fingers; a donkey-ride will take you to a Bedâwin encampment.

The Fayum is not reckoned among the oases; but it is a true oasis—resulting from a depression below the Nile level into which the Nile waters infiltrate—and looks it more than any so-called oasis in Egypt; for it is a land flowing with sparkling waters, which is surrounded by the desert on every side. Here you see the rich palm-groves which the teachings of your childhood have associated with the idea of an oasis. Except that its waters are not still, but

blessed with the swift natural current which turns the frequent water-wheels automatically and sweeps away the dreaded malaria, the beginning of the Twenty-third Psalm—'He maketh me to lie down in green pastures: He leadeth me beside the still waters'—might have been written of the Fayum, the land of many waters, whose pastures are so green in the midst of the desert.

In Egypt the Fayum is known as 'the Land of Roses;' it is the only place in Egypt blessed with corn and wine and oil. For nowhere else, except in an orchard or two round Alexandria, do you see the olive flourishing by the side of the vine. Here the orange, the peach, the fig, the pomegranate, and the prickly pear rival each other in their luxuriance, and rice, sugar-cane, cotton, and flax pour forth their abundance. Very refreshing to the eye are this riot of greenness and fertility, and the mighty lake of fresh-water beyond, in a land where every acre which is not irrigated from the waters of river or lake is absolute desert.

It is a land, in Arab legend, of ancient traditions too, for its name, 'the Land of a Thousand Days,' comes into the story of the patriarch Joseph. And all the ancient historians from Herodotus onwards wrote of its marvels and its monuments. They were probably very extraordinary, and the Fayum is sown with their remains, but too mutilated to give any idea of the grandeur of the Colossi which rose from the lake at Biahmu by King Amenemhat's great barrage, or the splendours of the Labyrinth, that thousand-chambered palace of snow-white limestone fine as marble, full of sculptured figures, of which Herodotus wrote: 'If any one should add together the buildings and the public works of the Greeks they would be found to have cost less labour and expense than this Labyrinth, though the Temple in Ephesus is deserving of mention, and also that in Samos. The Pyramids, likewise, are beyond description, and each of them comparable to many of the great Greek structures, yet the Labyrinth surpasses even the Pyramids.' Herodotus may not have said too much. We know that it covered a space almost as long and twice as wide as the Vatican, and that though its twelve courts contained but fifteen hundred rooms above ground against the thirteen thousand of the Vatican, every nome in Egypt had chambers for its government and temples for its gods in this one Imperial Palace.

The whole extent of the cultivable part of the Fayum was never more than forty miles each way, and is now not much over twenty; but it was the favourite residence, small blame to them, of the great kings of the twelfth dynasty, the Usertsens and Amenemhats, one of whom, Amenemhat III. (3200 B.C.), may prove, if tradition is borne out by the discovery of fresh inscriptions, the most interesting monarch of remote antiquity. It was he who had the first Nilometer marked on the rocks of the cataract above Wady Halfa; it was he who drained part of the Fayum, and turned the rest into the first Nile reservoir by the twenty-seven-mile-long barrage with which he banked in Lake Moeris, and of which traces still remain. That we know. It was he who built the Labyrinth, he who built the Hawara Pyramid to be his tomb. And if the Arab tradition which associates the patriarch Joseph with the cutting of the Bahr Yusuf and the draining of the Fayum relates a fact, since the King Raiyan of the legend is undoubtedly Amenemhat III., we have a flood of new light thrown upon Joseph and his Pharaoh. But even if the Fayum had had no traditions, no antiquities, no scenic glories, no opportunities for sport, it merits a visit; for, with the exception of a portion of the Delta, it is the richest and most highly cultivated part of Egypt.

In one respect only was I disappointed. There are hardly any up-to-date photographs or post-cards to be bought in Cairo; and from Major Hanbury Brown's volume I had imagined its capital to be a medieval Arab city, as picturesque in its decay as Rosetta or Damietta, as full of old mosques and tumble-down palaces. But instead of this I found a thriving modern town, with an old bit here and there, it is true, but depending for its picturesqueness on the Bahr Yusuf and the oriental aspect of its noble mansions, which look like pashas' villas, but mostly belong to rich Coptic or Arab landowners, who live in them and superintend the cultivation of their land. Some of them live there altogether; others, as their wealth increases, have houses in Cairo also, and use their Medinet Fayum mansions when they want to visit their property, and as country-houses for passing the summer months.

Medinet is saved from ugliness and vulgarity solely because there are no Europeans living in it. Its palaces are purely Arab, and as they are spreading and lofty, and have overhanging meshrebiya-latticed windows and gay Arab decorations, the effect is oriental and pleasing. But the old mill which once spanned the Bahr Yusuf in the main street has been improved away, as have the picturesque and tumble-down adjuncts of the mosques, and the bazaar is of the uninteresting sort you find in a prosperous native town which does not expect visits from foreigners.

Everything in Medinet depends upon the famous Bahr Yusuf. It is the Bahr which gives this ancient capital its beauty. It is a river-like canal, which flows through the centre of the city in Venetian style, spanned by many bridges, and with palaces overhanging it. To this day it is not finally settled whether it is river or canal. The latest scientists contend that it is a naturally formed branch of the Nile; that at some date before the dawn of history the Nile in flood burst through the bank separating it from a chain of depressions, and struck out a fresh channel for itself, by which its waters found their way into the Fayum reservoir, to flow back again at low Nile. The swift current supports this idea; but the tradition of its being an artificially cut canal is of high antiquity, and traditions generally have some kind of foundation.

The Arab tradition quoted by Major Hanbury

Brown states that Joseph, who was still prime minister of Egypt and high in favour with the king when he was more than a hundred years old, incurred the envy of the Court. The courtiers insinuated that age had robbed him of his judgment and sagacity. The king told them to set him a task which should be a test. At that time the Fayum was called El-Hun, or 'the Marsh.' It was a mere waste basin for the Nile floods. The courtiers suggested that Joseph should drain it, and give the king a new province. The king sent for Joseph and said he wished to give his daughter a separate establishment, but that he had no territory available except the submerged land of El-Hun. Joseph inquired, 'When would you wish it done? For accomplished it shall be, by the aid of Allah the All-Powerful.'

'Then Allah inspired Joseph with a plan. He directed him to make three canals: one from Upper Egypt, a canal on the east, and a canal on the west. Joseph collected workmen and dug the canal of Menhi from Ashmunin to El-Lahun. Then he excavated the canal of El-Fayum, and the eastern canal, with another canal from El-Hun. Then he set an army of labourers at work; they cut down the tamarisks and the bushes which grew there, and carried them away. At the season when the Nile begins to rise the marsh had been converted into good, cultivable land. The Nile rose, the water entered the mouth of the Menhi canal and flowed down the Nile Valley to El-Lahun, thence it turned towards El-Fayum, and entered that canal in such volume that it filled it, and converted the land into a region irrigated by the Nile. King Raiyan thereupon came to see his new province, with the courtiers who had advised him to set Joseph this task. When they saw the result they greatly marvelled at the skill and inventive genius of Joseph, and exclaimed, "We do not know which most to admire—the draining of the marsh and the destruction of the noxious plants or the conversion of its surface into fertile land and well-watered fields." Then the king said to Joseph, "How long did it take you to bring this district into the excellent state in which I find it?" "Seventy days," responded Joseph. Then Pharaoh turned to his courtiers and said, "Apparently one could not have done it in a thousand days." Thus the name was changed from El-Hun, or "the Marsh," to El-Fayum, "the Land of a Thousand Days."'

Certain it is that the Bahr Yusuf has all the effect of a river. The riverscape both up and down the stream is delicious; even the far-famed Mahmudiya at Alexandria does not yield such dream-pictures of palms. The inhabitants of the Fayum, so the Khedive himself informed me, are the worst people to be found anywhere in Egypt, except in one small patch of the Delta. He accounted for this partly by their having more Bedâwin blood in them than any other settled population in Egypt, partly because they were rich. 'It is a noticeable thing in Egypt,' he said, 'that when people grow rich they begin to intrigue.' I asked the Governor of Damietta why people should intrigue because they were beginning to be better off. He replied that 'an Egyptian likes to intrigue when he has enough brain, but that when he is poor he has not the proper opportunity.'

One can spend a week very profitably in the Fayum, though those who are particular about their creature comforts would not spend two nights at Medinet, for the best hotel and its food are on the primitive side, if the bedrooms are free from vermin. The dual system practised at this hotel is also a little trying. It has a branch establishment out on Lake Kurun; and when the waiter, who is the only person that speaks any civilised language, is out at the lake it is not easy to express your wants to the Greek proprietor. This was our lot. Fortunately the cook could speak Italian, so he used to wait on us and answer our bedroom-bells, while the proprietor took his place in the kitchen. As the food was just possible, and the rooms were clean, we could be quite philosophical in such a focus of interest and beauty.

Out at Lake Kurun everything was very well done, but of that anon.

We spent three or four days at Medinet because there were three things which we wanted to see well: (1) the ruins of Arsinöe, the city of the crocodiles, and of the famous buildings on Lake Moeris, if Lake Moeris ever came near them; (2) the Hawara and Illahun Pyramids, and the Labyrinth, about which classical anthors wrote such marvels; (3) the high cultivation of the Fayum.

Lake Kurun or Karun, the Moeris of the ancients, is still much the largest body of fresh-water in Egypt. Even now it covers seventy thousand acres. Once, if we may believe tradition, it was one hundred and fifty miles round, or if we can believe Herodotus four hundred and fifty. Its surface is one hundred and forty feet below the level of the Nile, and two hundred below the level of the sea, and tradition favours the idea that its waters flowed right up to the walls of Arsinöe—in other words, to the Bahr Yusuf and Medinet Fayum. Engineer officers, using their levels in the unaccommodating way they affect, have found difficulties. They do not believe that the two stone bases at Biahmu were ever surrounded by the lake; they have still less faith in the two Pyramids six hundred feet high (half as high again as the Great Pyramid) which Herodotus says rose, with Colossi on their summits, from the middle of the lake. On their showing the lake in which the sacred crocodiles that gave Arsinöe its name of Crocodilopolis disported themselves, with their hides gilt and bracelets on their paws set with precious stones, could hardly have been the great lake itself; it must have been a smaller lake devoted to the purpose. One could almost weep tears over these poor crocodiles, who were fed like human beings, instead of being allowed to cater for themselves

with festering corpses, which are snipe to the crocodile.*

The expedition to Lake Kurun, the existing portion of the magnificent Moeris created by Amenemhat III., is full of interest from the moment the train deposits you at Ebshawai to take carriage for the hotel on its shores. The whole way along you meet a procession of the half-Bedâwin inhabitants who live on the lake shores, very elegant people, of a very distinct type. Sometimes you meet a woman on an ass, with a babe in front of her, and her husband walking beside them, in the traditional attitude of the Holy Family; much more often you meet the husband riding the ass, with his wife walking meekly beside him, carrying on her head an enormous iron cauldron containing the produce she means to sell in the market. I have even seen half-a-dozen geese in one of these cauldrons. The faces of the women are often very pretty, in spite of the blue tribe-mark tattooed round their mouths and their eyes, and they have beautiful figures. They dress like the Bedâwin, and, like the Bedâwin, are unveiled. Their jewellery is unique and resplendent, especially in the matter of nose-rings and necklaces.

All the Britons who go to Lake Kurun come away pleased; the sportsmen find its tamarisk marshes excellent cover for water-fowl, and its fish running much larger than fish of the same species in the Nile. Under the Pharaohs every year, when the flood-water of the Nile was ebbing out of it, the king's fishermen used to take a talent's worth of fish each day. Plenty of people who do not care for sport are delighted with the Central African aspect of the hotel, as it stands on a patch of lawn surrounded by tall clumps of reeds, from which every minute you expect a hippopotamus to emerge. The bedrooms are reed-thatched Kaffir huts. The dining-room and drawing-room are in a canvas pavilion, lined with gay Arab tapestries, erected on the platform which serves as a place of refuge in time of flood. Weird African birds haunt the reeds. Fishing-boats, very large, very clumsy, delightfully barbaric, which look as if they had been left behind by the Pharaohs, glide up the waterways between the reeds.

But these waterways are deceptive. If you wish for a sail on the open lake among the pelicans, or to cross over to Dimé, the Egyptian Pompeii, the boatmen have to get out of their grand boats and walk breast-deep in the muddy water, pushing them over the shallows in the tamarisk swamps.

No one could call the ruins of Crocodilopolis beautiful or interesting. There is nothing left of them but the mud walls, and, as a large Mohammedan cemetery is perishing on the site, it is often hard to tell whether the walls before you belong to an Arab's grave or an ancient Egyptian's palace. Added to this, the keen agriculturists of the Fayum regard the dual site as a valuable bed of manure, which they cart away as they require it. But since the manure-hunters find many interesting objects of Ptolemaic art, from little gods to clay toys, they are perhaps blessers in disguise.

The drive out to the two Pyramids and the Labyrinth, on the other hand, is one of great interest and beauty, and with it is combined the best opportunity for studying the high cultivation of the Fayum. When you first leave Medinet your way lies between deep groves and orchards and crops which seem to spring up spontaneously, so rich and well watered is the land. Then you cross a plateau with the ruins of an ancient Greek village on it, undistinguished, after the manner of domestic ruins in Egypt. Immediately beyond this is a sight almost unique in Egypt, a broad, green valley with a river running along its bottom, and waving trees.

Hawara itself, when we saw it out of irrigation-time, was pure Egypt, relieved by the smiling village with its broad lagoon, its groves of shady lebbeks, and wonderfully picturesque pigeon-towers. For it consisted of broad fields of sandy soil as bare as the desert, intersected by deep canals, and rising gradually to the base of a Pyramid which, when it had its fair, white limestone casing, was as large as the Great Pyramid is to-day. At the proper season these arid stretches of soil bear one of the richest cotton crops of Egypt. Twelve thousand cantars of cotton, fetching forty-eight thousand pounds, were raised from Mr Haddad's Fayum estates the year before. The land was very highly farmed, a couple of steam-engines were ploughing, and another was working an earth-scoop to change a level. Mr Haddad, who was riding a blood-horse and was dressed in immaculate English riding-kit, though he was a Syrian looked like an Englishman fresh from Oxford. He was as modern in his methods as a Lothian farmer.

We left our carriage and mounted three of the strong Egyptian asses for a ride round this famous field of antiquities. First we determined to ascend the Hawara Pyramid, leaving our asses, when we had ridden across a vast Egyptian cemetery, denuded by the winds until the whole slope was strewn with skulls and bones, and linens which had been wrapped round mummies two thousand years ago.

*There has been a city on the site of Medinet Fayum for four or five thousand years. The Pharaohs called it Shodit, 'the Reclaimed,' from the draining of the great marsh. The crocodile god Sobku, the chief of the aqueous gods, was naturally most in favour. Maspero speaks of 'the unique character of the religious rites which took place there daily. The sacred lake contained a family of tame crocodiles, the image and incarnation of the god, whom the faithful fed with their offerings—cakes, fried fish, and drinks sweetened with honey. Advantage was taken of the moment when one of these creatures, wallowing on the bank, basked contentedly in the sun. Two priests opened his jaws, and a third threw in the cakes, the fried morsels, and finally the liquid. The crocodile bore all this without even winking; he swallowed down his provender, plunged into the lake, and lazily reached the opposite bank, hoping to escape for a few minutes from the oppressive liberality of his devotees. As soon, however, as another of these approached he was again beset at his new post, and stuffed in a similar manner.'

Here were laid bare the famous Roman portraits of the British Museum and our National Gallery. There was a tradition that this Pyramid was built by the Israelites. If it was, they made its bricks before they were deprived of straw. I took a photograph which brings out plainly the straw in the bricks, which are very large, as much as half a yard long.

As we climbed up the Pyramid I was consumed with remorse, because the bricks which had defied the elements for forty centuries crumbled under my shooting-boots at every step. We had a fine view from the summit of the other Pyramid, and the desert which encompasses the Fayum oasis. But my eyes soon wandered back to the mêlée of mud foundations and shattered cornices and columns which lay at our feet in the sharp angle of the deep, swift canal. For this was the famous Labyrinth, where Joseph's Pharaoh was a god on earth.

Of Herodotus's fifteen hundred underground chambers, filled with the mummies of crocodiles and kings, remains may yet come to light; but there is more left of Carthage itself than of the Labyrinth above, which was one of the wonders of the world.

From mud-brick cellars my attention soon wandered to a covey of young sand-grouse a little paler than the colour of the sand (which I could have killed with my stick if I had not been trying to kodak them, as I kodaked the monster porcupine in the berseem an hour before), and a curious transparent lizard, which seemed to be almost white naturally. This I took at first for a cerastes, the little, horned viper of Egypt, the asp which made Cleopatra cease from troubling. There was not much to see; there was absolutely nothing to be made out. More interesting really was the clump of bulrushes growing at the edge of the canal below, for they are supposed to have died out of Egypt since Moses's time.

---

# ONE GENERAL ASSEMBLY—AND AFTER.

## CHAPTER III.

MUIRTON again—the home-port. But for one of the voyagers who had left it so full of joy and hope a short week ago it was a changed place. Formerly it had represented to Helen Campbell the whole of life; all she had ever known or felt had been experienced at Muirton. Now it had become a sanctuary wherein she might hide the hurts and disfigurements that a week's contact with the world had inflicted on her.

Her life seemed to be divided into those two strangely unequal parts, eighteen years and one week, yet in the latter division the sweet, gradual development of the whole earlier period had been ruthlessly undone, burnt out as it were, in one intense experience. The last day in Edinburgh was like a separate, detached fragment of her history; it belonged neither to the unrealising part nor to the delusive security of her first acquaintanceship with Archibald Napier.

But the very bitterness of the disillusionment she had suffered had carried her through it. Even the minister and his wife were momentarily deceived by the exuberance of her spirits on the morning following the reception at Holyrood; while her aunts, whose knowledge of psychology was limited, took no pains to conceal their mystification.

Helen's one hope had been that she would be spared another meeting with her cousin, but even this boon had been denied her. He had arrived while they were still at luncheon, moody and taciturn, and altogether unlike the gay, insouciant Archie of old; and after refusing his aunts' offers of hospitality, he had abruptly invited Helen to go out driving with him.

Something in the girl's manner as she declined the invitation brought a sting of colour into his face. There was no mistaking the disillusionment in the gray eyes as they met his. All the hero-worship, the faith of the previous days that had ministered so to his vanity, while at the same time it appealed to his better nature, had vanished, and for the first time in his life perhaps Archibald Napier felt ashamed of himself.

The fact of her refusal, too, increased his desire for her society. If he could but have her alone again, he felt confident of his power to reinstate himself in her regard. There were so many excuses he could offer for his neglect the previous evening, arguments that he knew must appeal to her—he had been busy preparing them all morning.

But a further request on his part only drew forth a more unflattering negative.

'No, thanks. I don't want to risk my life a second time,' she had retorted laughingly.

The surprise occasioned by her words told Archibald that she had respected his wishes in the matter of keeping silence as to their adventure on Arthur's Seat. Her disclosure of it now was but another proof that his desires were no longer of consequence in her eyes, and added a further sting to his humiliation.

A little later he had abruptly risen to depart.

There was no suggestion of a continuance of their intimacy in Helen's eyes as she held out her hand, but a sort of finality that he was bound to respect.

'Good-bye,' he said, and turned away.

And that was the end of her romance.

Now there was no need for any further acting or dissembling. By a sort of tacit intuition she knew that her parents realised her plight and sympathised with all the silent strength of their affection for her. It was herself she had to face in those gray

days after her return: the rehabilitating of her shattered forces, the building up of something new out of the ruins, something new and different, so different from the Helen Campbell of old.

But instead of becoming easier as time went on, the task she had set herself increased in difficulty. The hurt to her pride gradually faded, being only a temporal affair; but her love remained. The disillusionment had altered its quality, but left its strength undiminished.

Archibald Napier was no longer the hero she had apotheosised, but he was still the man to whom she had given her love. She had flung his flowers from her in the first access of her bitterness, but she had returned to pick out one rose from the faded spray that she kept now as the sole relic of her romance.

Occasional news of him reached the quiet manse in her aunts' letters. They had conscientiously set themselves to carry out the reconciliation with their misguided niece, effected by their invitation to Edinburgh, and the result was an intermittent correspondence that Mary Campbell would have willingly dispensed with. Much more had been lost than gained by the experience, as far as the happiness of her family was concerned, and she dreaded further trouble for Helen in the announcement that might any day arrive of Archibald's engagement to Jean Dalrymple. The Misses Drummond had judiciously hinted at the possibility before they parted, perhaps from a kindly motive of destroying any latent hopes in the girl's heart, perhaps for more worldly reasons.

But both their ambitions and Mary Campbell's fears were destined to an unlooked-for conclusion. The news of Lady Jean's engagement did appear shortly after this, but the name of the bridegroom was not Archibald Napier. One of his brother-officers had carried off the prize upon which the worldly heart of Miss Effie Drummond had been so eagerly set.

A few days later came an agitated letter from Edinburgh to the manse at Muirton. Archibald had exchanged into the other battalion of his regiment at present engaged in a small punitive expedition on the Indian frontier, and had sailed that very day.

The corollary was unmistakable, but on Helen the news acted like a challenge. What matter his motive? The fact remained that he had volunteered for active service. The heroic side of him was uppermost again, and the little lapse in chivalry, the momentary concession to externals, was forgotten, wiped out as if it had never been.

Her whole mind and thought were concentrated on that spot on the map where among the narrow mountain passes and treacherous rocks her hero was to exploit his valour. The fact that he had left without a word of reconciliation or explanation for her afforded her no pain. She had accepted the reality of her defeat too literally to expect any greater consideration. Yet with womanly perversity she nourished a strong resentment against her rival for having, as she believed, disdained his love and so driven him to this step.

The suffering she had herself been through gave her an insight into what he must be enduring, and the longing to comfort him eclipsed even the sense of her own loss.

The minister and his wife anxiously watched this new phase of her development. Could she go on indefinitely at this high tension? Her beauty had bloomed again miraculously under the impulse of the new emotions, but there was a strange spiritual quality about it that betrayed the unnatural exaltation of her mood. What would be the effect of any disastrous news from the front upon her now?

The list of casualties was slight; but at any moment the name they had been dreading might appear, and that would be a still more terrible awakening for her. One officer and three men wounded in a scrimmage; then the death of a subaltern, victim of sniping among the treacherous rocks. And so on, week by week.

At last the climax arrived, though in a fashion unlooked for by any of them. Archibald Napier was recommended for the V.C.

A letter from Miss Drummond was the medium by which the glorious news reached Muirton. The wife of the brother-officer whose life the hero had saved by a splendidly reckless act of daring had written full of gratitude and thankfulness to tell her. No mention of the little incident or its consequences in Archibald's own letters.

That was the end of Helen's endurance. Her tears came then, and washed away the last memory of all she had suffered and the wrong that had been done her.

Miss Effie died that autumn, passing delicately out of life, as she had always lived, in a luxurious chamber, surrounded by every luxury and refinement that money could buy, and with as little struggle as it had cost her to exist.

Miss Drummond endured her loneliness for a few months, and then wrote to Muirton, summoning Helen to bear her company. So, in a little while, the girl found herself once again an inmate of the great house in Moray Place, though under very altered conditions. Now that Miss Effie's influence was removed there was no one to deter her aunt from following her own bent in the matter of her niece's adornment, and for the first time in her life Helen was equipped with all the necessary paraphernalia of a girl of wealth and position.

Miss Drummond took a frank satisfaction in watching her beauty develop under the process, and of hearing on all sides the admiring comments of her circle. But for Helen herself the exuberant delight she would have experienced six months ago over her own metamorphosis was tempered to a great extent by the sorrow she had passed through. There was the feeling that as far as her happiness was concerned it had all come too late, though she

was true woman enough to appreciate the pleasurable sensations of being well dressed and exciting admiration.

If only she had had the same advantages on her first acquaintanceship with Archibald Napier her romance might not have been so ruthlessly cut short. Already her short contact with the world had revealed to her the tragic episode at Holyrood in its true proportions. The shock to the fastidious, conventional side of her cousin's nature at the contrast she must have presented that evening to the other women of his set, his masculine incapacity to assign the true cause of the difference, his chagrin at her failure to come up to his standard—it was all so simple, so excusable, seen in the light of a wider experience; she could almost laugh at the little episode now that had cost her such infinite bitterness a few months previously.

No reference to the incident had been made by her aunt since her coming to Edinburgh, and Helen herself avoided any allusion to the subject. Their talk of Archibald was always of an impersonal nature. He was the object round which both their interests centred, but it was almost exclusively in his public capacity that they discussed him. Helen's sympathy for Miss Drummond's anxiety as to his welfare did a great deal to help and sustain the elder woman during this time, but of her own feelings she said no word. It was enough for her to be at the headquarters of intelligence about him, to see his handwriting on her aunt's letters, and listen to the scraps of news they contained read aloud for her edification.

The little campaign was nearly over, any day they might hear of the withdrawal of the troops, and so far he was safe. He had achieved distinction besides. The story of the escapade that had earned for him the Victoria Cross had been made public in the newspapers, and congratulations had poured in on Miss Drummond. But on one subject she still preserved an unbroken silence: the motive that had driven him to volunteer for the front. Perhaps her disappointment in the matter of his marriage was too keenly felt to allow of any allusion to it; perhaps her resentment against Jean Dalrymple made any reference to the subject difficult.

These, at all events, were the reasons Helen assigned for her aunt's reserve. But events were to prove how mistaken her beliefs were.

The revelation of the truth came unexpectedly one evening. They were going out to a quiet dinner, the first definite invitation Miss Drummond had accepted since her sister's death, and she had insisted on Helen's putting off her customary black and appearing in a white satin dress she had herself ordered for her with great care.

As Helen entered the drawing-room, fully attired, her aunt, who was seated by the fire, turned expectantly, uttering a little gasp of amazement as she did so. It was as if the full revelation of the girl's beauty had come to her for the first time.

'Do you like it, Aunt Charlotte?' said Helen, laughing a little with pleasure as she came forward to the fire.

Miss Drummond had risen and was gazing at her with a curious mingling of admiration and regretful sadness in her eyes.

'My dear, there's a story attached to that dress,' she said. 'You should have had it last year for the reception at Holyrood; but Effie, for certain reasons of her own, would not let me order it for you.'

A shadow had crossed Helen's face at her aunt's words. Her eyes, turned to the fire, seemed to be seeing strange things. Again in imagination she was living through the steps of that evening's disillusionment. Again there seemed to come to her the faint scent of roses dying at her breast. Then all at once the desire to know more recalled her to the present. Such an opportunity for learning the truth might never occur again.

'Why did Aunt Effie not allow you to order the dress?' she demanded, raising her gray eyes suddenly from the fire and fixing them full on her aunt's face.

The Miss Drummond of six months ago would have returned some evasive answer. But the uncompromising directness of the question was infectious, and seemed to call for an equally candid response. Besides, she realised in a sudden flash how dear this slender girl had become to her, next to Archie in her affections, and she could not resist the importunity in the gray eyes.

'It was because she was afraid of your attractions for Archie,' she acknowledged quietly.

Helen's face paled at her words, then she laughed a little bitterly.

'She need have had no fear,' she said. 'Cousin Archie cared only for Lady Jean Dalrymple.'

'Did he?' queried Miss Drummond sharply. 'You're mistaken there. He never even asked her to marry him. I suppose you believed, like other people, that she had refused him?' she added bitterly.

But Helen was staring at her with bewildered eyes. She seemed not to have heard the words.

'Then why did he volunteer for the front?' she said at last in a slow, deliberate voice.

Miss Drummond shrugged her shoulders.

'That's another question,' she said, 'one that I can't answer. It certainly had nothing to do with Jean Dalrymple. It was just a whim; he was always impulsive, and I suppose the do-nothing life at home had tired him. It was a great blow to poor Effie; her heart was set on that marriage. I think it helped to kill her. But there's the carriage; we must go,' stooping to pick up her cloak from the chair.

Helen looked round vaguely for her own wrap, and her thoughts were whirling strangely. Could he have cared—could he have cared after all?

The drawing-room door had opened. But as they turned, instead of the servant they had expected to announce the arrival of the carriage, their

eyes were met by a stalwart, sun-browned figure enveloped in a long, dark coat.

'Archie!' screamed Miss Drummond, staggering against the mantelpiece.

Helen caught her, placing an arm protectingly around her. She too, for an instant, believed that the apparition was a wraith. But the next instant his voice reassured her.

'Don't be frightened. I'm not a ghost,' cried Archibald Napier, coming quickly forward and taking his aunt out of the girl's arms. But his eyes were on Helen's face all the time. 'White satin without diamonds!' he said in a queer, low voice. 'How often I have seen you like that in the camp-fire, and dreamt of you too, Cousin Helen.'

He broke off, turning away. Helen was white as death, but her eyes were luminous.

'I—I can't think of anything but the V.C., Archie,' she said.

'It was won for your forgiveness,' he said huskily.

THE END.

# THE MONTH: SCIENCE AND ARTS.

### THE ELECTRIC 'MARY ANN.'

NUMEROUS efforts have been made to popularise the utilisation of electric power in the house; and although small, serviceable, and reliable motors have been devised for the driving of the knife-cleaner, the mincer, coffee-mill, and what not, the main drawback has been that each machine required its own motor, which became a fixed attachment. It is apparent that under such circumstances the cost of fitting electric motors to the various domestic machines in an average household would be somewhat prohibitive. This disadvantage, however, has been ingeniously and successfully overcome by the production of the electric 'Mary Ann,' which is the invention of a well-known consulting electrical engineer, Mr R. Borlase Matthews, A.M.Inst.C.E. This machine comprises an electric motor which can be attached and detached from any appliance in the house within a few seconds, and, weighing only seventeen pounds complete, while it is no more bulky than a typewriter, can be easily carried from room to room as required. The motor is small, strongly built to withstand rough wear, and so designed as to prevent breakdown. The motor is fitted with a counterweighted projecting arm which carries a large pulley. On the inner side of the shaft of this latter is mounted a small drum, and a belt passes over the large pulley and a small one mounted direct on the motor-shaft. In addition there is a large, light rim-wheel which is attached to the particular machine to be operated. For instance, say a knife-cleaner is to be electrically driven. The wing-nut on its shaft is released, the detachable rim-wheel placed on the shaft, and the nut replaced. The knife-cleaner is clamped firmly in position in such a way that the rim-wheel comes into contact with the drum on the shaft of the outer motor-pulley. When the motor is set in motion the rotary action of the pulley is transmitted to the wheel on the knife-cleaner by friction-drive. If a coffee-mill or mincer is to be used the rim-wheel is similarly set in position. The attachment and detachment take only a few seconds, and by electric power what is generally regarded as an arduous, protracted task is achieved with ease and no physical effort in a few seconds. The motor is fitted with a switch, a short length of flexible wire, and a plug. All that is necessary is to withdraw an electric lamp from its holder and insert the plug, switching on and off as required. The motor will drive any machine in the house that is ordinarily turned by hand, and the list of such appliances runs well into fifty. It can be adapted to the cleaning of grates, boots, and silver-plate. For this work there is provided a short flexible shaft, coupled to the shaft of the motor and fitted with a polishing-bob on the outer end. In cleaning, it is only necessary to pass the bob over the surface to be cleaned, and the high speed at which the bob revolves accomplishes the cleaning operation in a few seconds. Rotary washing-tubs, wringers, sewing-machines, vacuum cleaners, &c. can all be driven in turn by this electric servant, and at the minimum of expense. The cost of electric energy is a farthing per hour actual working-time; and when it is finished with, the motor is packed in a box and stowed away. Householders already using electric light will find this little apparatus of great value, and it will be found to be a successful solution of the problem of accomplishing distasteful work in a highly satisfactory manner in the minimum of time.

### A SIMPLE POWER-DRIVE FOR CHURCH ORGANS.

The manual blowing of a church organ by the oscillating movement of the bellows-handle is a particularly arduous occupation, especially with 'full organ,' when the tell-tale appears to resist any inclination to descend far below the 'empty bellows' reading. Conversion to mechanical blowing is, however, generally a somewhat expensive matter; but recently a new idea has been elaborated which is the acme of simplicity, highly efficient, and inexpensive both to install and maintain. This is the 'rotasphere.' It comprises a baseboard upon which is mounted a small electric motor fitted with a hemisphere of polished aluminium, which transmits the power of the motor through friction-drive to the pneumatic tire of an ordinary bicycle-wheel. The latter is fitted with the usual chain and

sprocket gear, the final transmission of power to the bellows being secured through a crank connected to the bellows-handle. The motor, of one horse-power, is mounted on a swivelling carriage, turning at right angles to the axis of the bicycle-wheel; and as the hemisphere turns with it, though always keeping in contact with the tire, the varying speed ratio is obtained. There is a chain connecting the swivelling carriage with the bellows, and the position of the hemisphere to the tire is varied according to the demands on the wind. When 'full organ' is being used and the heaviest call on the wind is made, the hemisphere is swung round so that the bicycle-wheel is driven at the maximum speed, and as the wind demand slackens the swivelling carriage returns to its normal position under the action of a powerful spring. The blowing is thus entirely automatic. The motor runs at a constant speed, and it is only the varying ratio of the hemisphere surface to the tire that brings about changes in the oscillating speed of the bellows-handle according to the demands upon the organ. The system is about one of the simplest and easiest that has yet been devised, for it entails no structural alterations. Should a breakdown through any unforeseen circumstance occur, the coupling-crank can readily be released and the bellows actuated by hand in the usual manner. The cost of running is about one penny per hour. The rotasphere occupies but small space, and as the vital part of its mechanism is built up of ordinary bicycle parts any replacements can be easily effected. Owing to the surface of the hemisphere being always in contact with the inflated tire there is no wear, so that maintenance expenses are reduced to the minimum. A simple, cheap type of mechanical drive for organs has long been desired, and the rotasphere certainly fills the gap. By means of a switch near the keyboard the organist can cut the motor in and out as desired.

### NOVEL COMBINATION SCISSORS.

The combination knife fulfilling a variety of functions has become well established in popular favour, and now the combination scissors have been introduced. They can be carried about in the pocket or used at home in the usual manner. They comprise the usual two legs; but these are so designed and fitted as to enable the tool to be used, in addition to ordinary cutting operations, as a cigar and flower cutter, pliers, a three-inch measure by graduating one side of the closed tool, paper-knife by making the outer edge of one leg comply with this requirement, screw-driver, railway-carriage key by the fashioning of the thick leg-end, wire-cutter, coin-tester by a notch in the side near the rivet, piercer, and nail-file. Such are only a few of the useful purposes to which these scissors can be adapted. In general appearance they resemble the conventional instrument, are just as compact, and as light. Practicability and serviceability are assured by the use of the finest steel, and they will be found a most useful acquisition to the pocket, while the housewife will find many of the combinations of distinct value in the course of her domestic tasks.

### A LAKE OF SODA.

During the past few months Uganda has come very much to the fore. But its claims to attention have been rather in the interests of sport. Lately, however, attention has been centred in a discovery, or rather a rediscovery, of valuable commercial resources in the form of vast deposits of soda stretching over an area of some fifty square miles. This find was first made some eight years ago by Major Burnham, but at that time the absence of transportation facilities prevented the chemical wealth being exploited. The soda is really the bed of a huge depression similar to the great Salt Lake desert of Utah. The area was formerly covered by a sheet of water, and was known as Lake Magadi; but the water has long since disappeared, so that now the lake exists in name only. At the same time, however, numerous springs bubbling forth over the district are continually contributing to the soda encrustation. The chemical has been analysed and found to be of great purity and of very high grade. The railway authorities are now preparing to remove the transportation disability by the surveying of a short spur from the Uganda railway to the depression. That the deposits will pay to exploit there is not the slightest doubt, as there is an enormous demand for the commodity, especially in the form of common or washing soda, while the demands of the soap manufacturing industries run into thousands of tons per annum. One great disadvantage militating against the working of the deposits is the inaccessibility of the region and the absence of water in the district separating it from the main line; but nowadays these drawbacks are not so serious as they were, say, eight years ago. There are over thirty million tons of the chemical in sight, and once the railway taps the region there is no doubt but that the industry will be taken seriously in hand. The demands for this article in various branches of commerce, the insufficient supplies from existing sources of production, and the cheapness with which the raw material could be obtained should certainly result in the creation of a great industry and the establishment of a lucrative enterprise in what has hitherto been regarded more as a natural zoo than anything else.

### DISINFECTANT TELEPHONE MOUTHPIECE.

On all sides the dangers lurking in the telephone mouthpiece have been emphasised, and a call has been made for some means of combating the dissemination of disease by this medium. An enterprising inventor has recently evolved an ingenious idea for avoiding the contraction of the germs of diphtheria, influenza, and consumption from this source of contamination. It comprises a solid metal mouthpiece fitted with a thick lining of solid disinfectant, and conforming to the lines and shape of the ordinary mouthpiece, only a trifle

smaller, so that it can slip into and fit tightly the latter. There are two metal clips which serve to hold it securely in the transmitter. The disinfectant is always clean and dry, the surface constantly changes under evaporation, and it retains its disinfecting properties until the whole of the disinfectant has evaporated, a period of several months. Another advantage is that owing to the shape of the mouthpiece the sound is increased, so that one can speak at a greater distance from the instrument than is at present possible. The attachment is cheap, and the potency of the disinfectant employed successfully prevents the multiplication of the germs which medical men insist continually takes place on the surface of the ebonite transmitter.

#### SAFETY POISON-BOTTLE COVER.

That accidents will happen in the best-regulated families is an old saw that cannot be disputed, and when these accidents assume the form of inadvertently taking virulent poisons from bottles the results are disastrous. To guard against this possibility various coloured and peculiarly shaped bottles have been devised; but when one is preoccupied it is very easy to make a mistake, as the poison-bottle is only closed by a cork, like hundreds of other bottles. As a protection against such a calamity, an inventor has evolved a special type of cover for bottles containing poison. It consists of a large disc of buff-coloured paper with the word 'Poison' printed in large letters in red round the edges and in the centre. A double tape is also provided to tie the covering round the neck of the bottle and over the cork. A space is left in the centre for affixing a gummed label specifying the nature of the contents—whether a lotion, virulent acid, or what not. In opening a bottle containing dangerous contents protected with this device the person would perform a definite and peculiar operation quite dissimilar from the withdrawal of a cork, and this would warn him of the fact that he was not opening an ordinary bottle. It would also guard against the opening of a wrong bottle in the dark, as the existence of the protective covering would instantly betray the fact that a particular bottle with a protective and distinguishing seal was being handled. Certainly the invention is a commendable preventive against the accidental use of the dangerous contents of a particular vessel.

#### A HOUSEHOLD WATER-SOFTENER.

The demand for soft water in every household at one time or another is one that cannot always be easily satisfied, especially in those districts where the supply is notoriously heavily charged with lime-salts. To meet this requirement a simple and inexpensive apparatus has been devised which should appeal to the householder, and which ensures a supply of soft water whenever necessary. It comprises a receptacle of five gallons capacity, fitted with a specially constructed filter. In this receptacle is placed a certain proportion of anti-calcaire powder, the quantity of which varies according to the hardness of the water. The tank is filled and the powder added. The contents are then thoroughly stirred and allowed to stand for at least six hours. The ingredients of the water responsible for producing the hardness are precipitated and are withdrawn in the form of a sediment. The chemical powder which brings about the softening of the water is perfectly innocuous, so that the person who drinks the water need not apprehend any ill effects. Although the powder removes the injurious lime-salts from the hard water, the sulphate of soda content, which is so valuable, and which constitutes the principal ingredient of the famous Carlsbad water, is left. When introduced into the system, water softened by this means gradually dissolves all the chalky deposits therein, and if the partaker indulges in plenty of exercise the amount of urea will be increased, with a coincident diminution of the proportion of uric acid, which is the poison that is responsible for rheumatism, gout, and other similar disorders.

#### EGG DEPÔTS.

Sir Horace Plunkett, Lady Salisbury, Mr Edward Brown, honorary secretary of the National Poultry Organisation Society, and others have been thinking out systems of agricultural organisation which will certainly tend to make farms and small holdings more profitable, and benefit the consumer. We can produce the best bacon, cheese, butter, and eggs in the world, yet we are only too much beholden to the foreigner for our supply. Over two thousand one hundred and eighty-five millions of eggs were imported from abroad in 1906, a large proportion of which might have been produced at home. The National Poultry Organisation Society is doing its utmost to remedy this by encouraging the establishment of egg depôts up and down the country, where farmers, small-holders, and cottagers may place their eggs to be tested, graded, and then sent quickly to market. By this system a higher price will be secured, and the consumer receive fresher eggs. The breed of hens is also being improved from poor layers to those which lay from one hundred to one hundred and fifty eggs a season. The work of certain Dutch merchants was described in 'Egg-Gathering in Russia' in last year's issue, and shows the value of co-operative effort. What *Punch* calls 'eggspresses' or 'missionary egg-trains' are to be run on certain lines. Two or three cars will be provided, fitted with models of appliances and diagrams, and experts will give addresses and demonstrations at various points. This should rouse the interest of farmers. Leaflets and literature and all information may be had from the National Poultry Organisation Society, Regent House, Regent Street, London. The Scottish and Irish Agricultural Organisations are in their own way working in the same direction. What can be done by private effort is seen in the success of Kinnedder poultry-farm, Fife, conducted by Mrs Dalziel. Last

December five thousand eggs were produced by four hundred laying hens. In the drawing-room at Kinnedder, where it has stood for a hundred years, there is a writing-table which belonged to Sir Walter Scott.

### AEROTHERAPY.

Professor Richet of Paris has invented an air-filter, which consists of a small ventilator worked by electricity, and beneath the fans of the ventilator is a reservoir of glycerine. The rotation of the fans scatters the glycerine in very fine drops along the walls of the cylinder containing the ventilator, and the two thousand cubic metres of air which pass through the cylinder are purified, since they constantly come into contact with a little cyclone of liquid particles, which carry with them as they fall the germs, dust, microbes, and spores always in the air. The mechanical sterilisation of the air by this method is a kind of laboratory imitation of the vast purification of the atmosphere caused by a heavy rainfall. Professor Richet thinks that the general use of his apparatus would materially diminish the risks of contagion by the germs of scarlatina, smallpox, and consumption. The 'Influence of Motoring on Health' was commented on here in 1908 (page 335). Dr R. W. Philip has pointed out that the chief factor in the causation of tuberculosis is the exclusion or insufficient supply of fresh air. The air of the United Kingdom he thinks remarkably well suited for the open-air treatment. The experienced cyclist and motorist is aware of the exhilaration which comes after a ride, as well as the risk of catching cold and depression which come from attendance at a gathering where the fresh air is exhausted. Madame Fanny Moody says that motoring improves her voice. The air is driven into the lungs in a way that neither walking nor golfing will do it. Only we have no analysis of the evil influences caused by inhaling miniature dust-storms caused by motor-cars. Dr Fremantle, County Medical Officer of Health for Hertfordshire, says dust on the roads must have a definite injurious effect on the lungs.

### BETTER FARMING.

Sir Horace Plunkett has set down some of the results of his thirty years of experience of agricultural affairs in a series of five articles in the New York *Outlook* upon 'Better Farming, Better Business, and Better Living.' He pleads for more co-operative action amongst American farmers, and suggests the formation of a Country Life Institute, which would be a bureau of research in rural social economy, gather existing information, examine and co-ordinate it, and lay down the lines of future investigation. Useful subjects to consider are the influence of co-operative methods on rural communities, and social life, rural education, changes in cost of living, and the action taken by different Governments to assist rural development. What Sir Horace managed to do when connected with the Irish Department of Agriculture is an object-lesson in this direction, as are also the facts in a paper by F. C. Howe in the March *Outlook*, 'A Commonwealth Ruled by Farmers.' The writer points out that though Denmark is far from rich, the climate not of the best, and the winter long, yet Danish butter, eggs, and bacon have captured the British and other markets. He points out that Denmark is a country of peasant-proprietors; the Danish peasant owns the land, as in France, Holland and Switzerland, and the co-operative system is well-nigh universal. This, along with intensive cultivation, is given as the secret of the Danish farmer's success; the land is a great dairy-farm and market-garden, the chief products of which are butter, eggs, bacon, poultry, and fine stock. The co-operative dairy system, egg export society, and bacon companies have meant commercial success to the whole country. In a valuable article in the *Field* on 'Agricultural Co-operators,' it is noted that from Russia in the east to France in the west, from Finland in the north to Hungary, Switzerland, and Italy in the south, agricultural Europe is full of co-operative societies. The Irish Agricultural Organisation Society has now a turnover of about two millions sterling a year. In England and Scotland the movement is younger, but is making steady headway.

*To Correspondents* who wish fuller information regarding new inventions mentioned here, addresses will be furnished, when possible, provided a stamped and addressed envelope or post-card be sent to the Editor, 339 High Street, Edinburgh.

## NEWNESS.

A SONG.

White clouds, light clouds, in the skies above;
Blue flowers, new flowers, like the light of love;
Gorse blooms 'mid the glooms, yellow as the sun;
Sunny ways, lengthen'd days all for youth to run!

Leaf-time, brief time, once again is near;
Bird-lays, full of praise, fall upon the ear;
Windows ope; on the slope, southern airs ablow
Banish all winter's thrall and the thought of snow!

Soon will vale and hill blossom free and far;
Sloethorn, reborn, every spike a star,
Throwing out, round about, scents that woo the bard.
Oh how bright the present light! Waiting time how hard!

Roll away, clouds at play, like to sheep that roam!
Little lambs seek their dams in the fields of home;
All the world recreate hails the time of cheer—
Spring-time, wing-time, chiefest of the year!

William J. Gallagher.

### *** TO CONTRIBUTORS.

1*st*. All communications should be addressed 'To the Editor, 339 High Street, Edinburgh.'

2*nd*. For its return in case of ineligibility postage-stamps should accompany every manuscript.

3*rd*. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, *should have the writer's Name and Address written upon them* IN FULL.

4*th*. Poetical contributions should invariably be accompanied by a stamped and directed envelope.

# THE SIGNET-RING.

By RICCARDO STEPHENS, Author of *The Cruciform Mark*, &c.

PART I.

I FEAR that, to begin with, I must bore you with a little bit of family history, or very likely family legend, to explain the ring—in part.

Family gossip says that in 1509, when Julius the Second was Pope, the head of a Venetian family named the Cavalli fled hastily from Venice to Rome, for what reason is not known, and he found it to his profit or his pleasure to stay there.

In Rome the family remained until 1663, the year that *Paradise Lost* was finished. A certain Riccardo Cavallo, Pope Alexander VII.'s messenger according to family tradition, was first in Ireland and then in London, often about the Court of the Merry Monarch, and evidently well known there. He married a lady-in-waiting to Henrietta Maria, and immediately afterwards bought a small estate in Cornwall, and took her there. Apparently they never saw anything of Court life again.

This, as I have said, was Riccardo Cavallo; but his son's son was known to the men of Cornwall as Richard Carvel, probably because Carvel was a name already known to them; and the eldest son has always been Richard Carvel since that time. The ring belonged, according to tradition, to that Riccardo Cavallo who buried himself, and his wife and any ambitions he may have had, in Cornwall.

The gold setting is thin with wear, and indeed must have been heavy at the start to have lasted so long. The cameo is rather large for modern taste, and the crest or device on it is a winged horse. That, say the family wiseacres, is reminiscent of Venice. The motto is the one word '*Amore*'—'Love' or 'By Love,' according as you take it for Italian or Latin.

One might romantically wish to trace some association between that word and Riccardo Cavallo's (and his wife's) retreat from London and the Court. Cornwall must have seemed sleepy after Whitehall. But the family wiseacres intervene again, and point out that if you reverse '*Amore*' you get *è Roma* ('from Rome'), qualifying the winged horse of Venice. We will venture no opinion about that, although such fantastic ingenuities were rather characteristic of some Carvels, as you shall see. We can only say that, while some three generations ago the small estate and any money there was in Cornwall took wings, no one knew precisely how, the winged horse did not fly, but remained, a considerable incongruity, to be occasionally unfortunately conspicuous upon the left hand of Richard Carvel, a most ordinary young general medical practitioner.

There was more on the ring than the winged horse and the motto we have mentioned; but young Carvel, who now takes up the tale, did not know it for some time. If you choose to read you shall see what he and others found on it, how they found it, and what it told them.

## THE ECCENTRIC MISS RAIMES.

She was a tall, very handsome woman, aged about fifty-five, with a dark, weather-bronzed complexion, in fine contrast to her absolutely white hair. I already knew that Dr Sime, whose practice at Ashford was in my hands while he went through a course of foreign baths, looked upon her as one of his most important patients. He had mentioned her to me before he went away as 'eccentric, but enormously wealthy;' and so, when I got my first message from her, I knew that I should be expected to appear promptly.

I was prepared to find a woman with more money than manners, difficult to please with anything short of obsequiousness, but I was quite mistaken. Miss Raimes charmed me from the first by her distinguished manner and her simple directness. I know it was pure kindliness for a lonely stranger which made her insist, at my first visit, upon ordering tea for me after my professional errand was accomplished. That, by the way, was

[*All Rights Reserved.*]

to advise her concerning her arm, which was rheumatic. She had broken that and a leg some five years previously when hunting. The broken leg caused her to limp ever so slightly; and she called her arm her barometer, it was so sensitive to weather-changes.

The Grey Moat, as her old place is called, has an uncanny reputation now, and I have heard people say that the very sight of it is suggestive. That may be, but nothing unpleasant suggested itself to me when I first rode up to the wide hall-door, and looked at the trim terrace, the old yew-trees and thick box-hedges, and the long, low, gray building, with its mullioned windows.

I suggested daily massage for the painful arm, and, getting in Miss Raimes's maid Parrett, I demonstrated the movements. To do this I slipped off my ring and laid it on the table beside me. Miss Raimes presently asked if she might look at it more closely, and she examined it while I gave Parrett, the elderly maid, her lesson.

Later, while I enjoyed some very delicious China tea, Miss Raimes referred to the ring again, touched upon the crests and armorial bearings of one or two families, mentioned incidentally that her own family was of Spanish descent, and showed an acquaintance with some curious jewel-lore.

'I have some interesting odds and ends of that sort,' she said, 'interesting at least to those who care for curios. I'll pick out a few and show them to you when you give Parrett another lesson. Come up on Sunday about tea-time, if you happen not to be busy.'

I suggested that if Parrett rubbed the arm according to my directions, and if the weather improved, Miss Raimes might not want to see me.

'Oh, come up! come up!' she said. 'An elderly spinster is better than no company at all on a Sunday afternoon down in Ashford. There's no society here, you know. Besides, I warn you that Dr Sime will feel defrauded when he comes back if he doesn't see at least two visits a week down against me.'

I think I tried to look scandalised; but I evidently didn't impress Miss Raimes, who merely laughed. After all, I suspected that she had measured Sime pretty accurately.

So it became a rule that I should go up to Grey Moat twice a week, as a matter of routine. It was not long before I had one invitation a week to dinner there; and whenever I could I accepted with the greatest possible pleasure. For a stranger like myself there was little to do in Ashford, once the day's work was finished. More than one of the big houses in the place were shut up, two or three families being in town. Naturally, too, those who were still in the country saw no reason, unless they were unwell, for bothering about a vagrant medical who would be gone in a couple of months. So I was often at Grey Moat, felt a greater liking for Miss Raimes every time I left her, and had fair reason to suppose that she liked me. Don't imagine that conceit misled me in the matter. Her liking was quite frank, a trifle patronising if anything, but not enough to offend. After all, she was thoroughly *grande dame*, with more accomplishments, more refinement, and better manners than I could flatter myself I possessed.

As for liking her, why, in that I merely agreed with everybody else. Poor Parrett adored her, and I do not believe that any of her servants ever ventured to criticise, even amongst themselves, any one of her many little eccentricities. Indeed, they were shown in such a matter-of-fact way that often you did not think of them until you had left her—even if then.

After all, on consideration, perhaps I am wrong in supposing that this whimsical lady liked me. She was interested in my ring, as you will see; perhaps without that as a talisman I should have known little of the eccentric Miss Raimes. I must hark back a little.

I went up to Grey Moat on the Sunday afternoon following my first visit, supervised Parrett's not very skilful efforts, had tea in a wonderful white boudoir, and saw some of Miss Raimes's curios.

I have since heard that her collection of jewels is unique, and that she could easily put fifty thousand pounds' worth of her rings on one hand without overloading it. But that afternoon she only showed me curios, mostly valuable no doubt, and many beautiful, but shown to me for their antiquity or historical interest only.

I remember a little hashish-box made out of two emeralds, which she said was of course valuable, but of no particular interest, and not to be compared with a quaint green armlet lying near it, which she had herself taken from the tomb of a Ptolemy. She showed me with one hand a jewelled fifteenth-century crucifix from Rome, and with the other a needle-pointed glass dagger from Florence of the same period. She had faintly scented gloves which she told me a blood-relation had carried to the guillotine; and by the gloves she laid an amber-tipped ebony wand which had belonged to an ancestor burnt for black magic in 1540; and by the rod, again, she laid a little, plain reed-pipe, which she said she had bought from an Indian snake-charmer, after having seen him use it.

'I practised with it on adders at one time,' she said calmly, 'and got on rather well. But servants are so foolish! The maids protested that they were afraid, after finding one among the sofa-cushions. I gave it up.'

I very well remember the first night I dined there.

I had never been able to live luxuriously, and would dine happily enough any night if I had something to eat, clean surroundings, and a book. That, I may say, is still very much to my taste. But Sime's servants were taking their holidays, and I had been catered for and served by the groom's wife, who gave me burnt chops, smoked milk-puddings, and generally left a finger-print on my

plate. So I fairly revelled in Miss Raimes's dinner-table, with its flowers, fine glass, old silver, and beautiful napery, and I enjoyed the Grey Moat claret very frankly.

'Claret has gone out of fashion, I believe,' Miss Raimes said regretfully, 'and whiskies-and-sodas have come in. I'm glad you drink claret, for I'm no judge of whisky.'

'A whisky-and-soda is quite good enough for me,' I remember saying with some amusement; 'but who wouldn't drink claret like this if he could get it?'

I remember this trifle because, for one thing, the claret was wonderful, and, besides, it seemed more in harmony than did whisky-and-soda with the old, panelled dining-room, the wood-fire, the quiet, skilful service, and above all with Miss Raimes herself, very erect at the head of her table, her great piles of elaborately arranged white hair conspicuous above a black dinner-dress, and her diamonds and emeralds flashing back the firelight from her long, fine hands.

I remember that at the end of dinner the liqueur she recommended was extraordinarily fragrant, and came, she told me, direct to her from Damascus, where a certain Jewish family had the secret of it.

While I drank some very excellent coffee (and what a rare thing that is!) and smoked a couple of cigarettes, Miss Raimes used a narghile, explaining that she always smoked for company's sake if she had men-guests.

I barely noticed her pipe, for she began to talk of various places and people of her acquaintance, and twice at least she had to remind me that my coffee was growing cold and my cigarette was burnt out.

That night she asked to see my ring again, and gave it an amount of attention that rather flattered and, at the same time, amused me. She questioned me further about its history, or legend, and I gave her—without vouching for their accuracy—little bits of gossip about it, which are not worth repeating just now, though I may speak of them later. But she shook her head at me, half-smiling, when I said that I had come to the end of my information—or gossip.

'You have no use for it?' she asked.

'None,' I said, 'except, of course, perhaps as a reminder that money takes unto itself wings. As I've practically no money, and no prospect of any worth mentioning, the reminder seems superfluous.'

She continued to consider the ring. She even got a small lens and peered at the thing through that.

'Did you know there were scratches on the inner surface?' she said at last.

'I can't say that I've noticed them.'

'If you have no use for it, perhaps you wouldn't mind selling it?'

'Oh, pardon me, Miss Raimes,' I said, 'I've no use, but some fondness for it. I might sell more useful things more readily.' Whereupon she dropped the matter for the time, and presently offered to show me over the house.

It seemed impossible to move in any part of it without being confronted by evidence of a long purse and a most cultured and artistic owner. Pictures, marbles, bronzes, tapestries, were all around, always in the right place, never crowded. Nor had any of the rooms the appearance of show-places. They seemed all more or less in use, and use was never subordinated to ornament. Every room's purpose was plain, till at the end of a long upper corridor Miss Raimes took a key from her chatelaine, and, unlocking a door, went before me into a room different from the rest.

This room was not so large as some we had looked into. Perhaps it was twenty-four feet by eighteen. It was remarkable for two things, which I could not help noticing immediately. The whole room was panelled to the ceiling with some dark wood of great smoothness and polish, and the floor too was polished and rather slippery, without any rug or carpet. Indeed, in the whole room there was nothing, except a curiously carved, low, four-legged wooden seat. There was not even a fireplace; and the window, rather high in the wall, was closed. That was the first evident peculiarity, but I had hardly observed the bareness of the place before I was conscious that I had quite involuntarily sniffed.

'What's the matter?' Miss Raimes demanded rather sharply.

'Oh, nothing,' I said. 'I—I suppose I was trying to identify your perfume.'

'Perfume' seemed a nice, polite word to use, but as a matter of fact the odour, whatever it might be, was not to my liking.

'Perfume!' Miss Raimes echoed. 'You don't mean to say that you smell anything? What is it?'

I sniffed again more openly, but couldn't tell her. It wasn't exactly drains; it wasn't incense.

'Is it musk?' I asked.

'Never use it,' said Miss Raimes with decision and some evident amusement.

'Perhaps it's just the odour of an unused room,' I suggested, 'and some polish the servants have used. You should have the room aired, Miss Raimes.'

'I must see to it,' she said gravely. 'Does your ring suggest nothing?'

'My ring!' I stared at it and at her. 'No,' I said, sniffing again; 'not that I am aware of. But my nose does.'

Of course I know that such blunt statements seem very rude; but really Miss Raimes dealt in blunt statements herself, and liked them in others—a rather unusual combination, I have noticed.

'Now, that is very interesting,' she said. 'I haven't found that other folk said anything.'

'I expect other folk aren't as rude as I,' I admitted. 'It's not strong, but it's here.'

'And you can't suggest a cause?' said Miss Raimes, herself sniffing delicately.

'I've no idea, but you should try open windows,' I said. 'And unless the air gets fresher you should have some of this panelling moved. There seems a good deal of space behind it;' and I rapped here and there upon the wood.

'Oh, any amount of space,' said Miss Raimes; and, leading the way out, she locked the door behind her.

As we went down the stair I said casually that I wondered such a good room was unoccupied.

'Pardon me,' Miss Raimes said at once, 'I use it constantly. I do a lot of thinking there.' Whereupon it occurred to me that perhaps she used the room for meditation or ritual of some sort, and that, after all, the smell might be that of stale incense or some burnt drug. I thought that I had perhaps pressed the matter too far, and had seemed curious. I said no more.

It was perhaps a fortnight later that the departure of Parrett took place. She was very much attached to Miss Raimes, but also, unless I was quite mistaken, very much in awe of her. I have, for example, seen her turn pale on dropping some unimportant article in Miss Raimes's boudoir, although her mistress did nothing more than shake her head at Parrett, as one might at a child.

I think it was Parrett's great anxiety to please, together with her nervousness, that made her so poor a masseuse. Middle and old age must be as anxious a time for the average domestic servant as for any one—which is saying a good deal. In my occasional fits of consideration for others I thought of Parrett with some sympathy, though I was too young then to guess what the anxieties of improvident or unprovided-for middle age are.

Miss Raimes made no complaint, but showed me a small bruise or two, in Parrett's presence, with a shrug.

Parrett began to quake and to lament, and Miss Raimes told her quite gently that she needed a rest, and must go and lie down for a while. Parrett went without another word, and Miss Raimes shrugged her shoulders again.

'Poor Parrett!' she said; 'a most well-intentioned creature, but old—too old and clumsy. Not of pleasing appearance either.'

'Not very old surely?' I said, for I confess I was sorry for Parrett, though why I didn't exactly know.

'Oh, no older than I, in point of years,' Miss Raimes admitted calmly, putting my actual thought into words, 'but a very great deal older in all that makes life cease to be worth living. I must provide for poor Parrett soon, I 'm afraid.'

And Parrett went sooner than I expected.

*(To be continued.)*

## THE ROMANCE OF COBALT, A MODERN EL DORADO.

SINCE the days of the Klondike gold-rush, no more remarkable mining discovery has been before the public than the rise of silver-mining in Canada. Only three years ago Canada was an unimportant silver-producing country compared with Mexico, and yet the returns for 1908 showed that it now ranks third in the silver-producing countries of the world. The most astounding fact of all is that the producing area occupies the small district, seventy miles long by forty wide, lying about three hundred miles north of Toronto, in the heart of the Canadian Highlands. In 1908 this district produced eighteen million ounces of silver, or more than 9 per cent. of the world's total production.

The discovery of Cobalt, as the district is named, was, like many other discoveries, entirely accidental, and occurred in the spring of 1903. In that year the Government of Ontario was building a railway through northern Ontario for the purpose of opening up the country. The news of the discovery was generally discredited at first, and Cobalt struggled through the summer of 1904 without any 'rush.' With the spring of 1905, however, things took on a different appearance, and prospecting started in earnest. In that year more prospecting was done than had previously been done at any one time in North America. Ground was torn up, cliff-faces were tapped, fissures were gutted, and phenomenal quantities of rich ore were obtained. In many places veins of solid silver were found on the surface, and often these self-same veins were polished to exceeding brilliancy by lumber, &c., which had been drawn over them by pioneers of northern Ontario.

The first discovery is credited to Fred La Rose, a working blacksmith attached to the railway construction-gang. It is said he threw a hammer at a rabbit scampering past, and when picking up his hammer had his attention attracted by a white streak on the rock-surface. Two other men, M'Kinlay and Darragh, also discovered mineral about the same time, and proceeded to stake out claims. La Rose, being an uneducated man and speaking little English, took Mr Martin, the railroad contractor, into his confidence. The latter helped him to stake out his claim, and received in return a half-interest in the property. Shortly afterwards La Rose sold his share to the Timmins Brothers of Ottawa for the paltry sum of twenty-five thousand dollars. The Timminses and Mr Martin worked the property together for some time, but eventually converted it into a company and named it La Rose. After the Nipissing Mine, the La Rose is the richest in Cobalt. It excites one's sympathy to learn that although La Rose does not work any more, he has not found wealth an unmitigated blessing. He can neither

read nor write, and whiles away his time gazing at illustrations in magazines and the like.

It was in the year 1905 that Cobalt promised to become a live mining-camp. Men prospected with redoubled energy, companies came into the field, and their labours were so successful that in that year alone no less than a million and a half dollars' worth of silver was produced. In 1907 the production was four times as great, while 1908 showed a return of over nine million dollars. The average price of silver in the New York market is fifty-two cents an ounce, and the Cobalt mines can produce the silver at a price varying from eight to ten cents an ounce. Compared with the cost of production in Mexico, where it is thirty-five cents an ounce, it is at once evident how Cobalt silver can dominate the market. In addition to this, the mines in Cobalt possess far readier means of disposal than the Mexican mines, having the railway to their door, so to speak. Thus, even if the price of silver went down to thirty-five cents an ounce, Cobalt mines could still pay handsome dividends, while the Mexican mines would of necessity have to close down.

Cobalt has not been without its giant nuggets. Only last May what seemed to be nothing but a boulder on one of the properties attracted the attention of a miner. Out of sheer curiosity he struck it with his pick. What was his surprise on hearing it give a metallic ring! He stripped off the moss and earth, and the sight that met his eyes gave him a shock. There at his feet, smiling in its lustrous beauty, was a glistening mass of apparently pure silver, a fortune in itself. It was over five feet in length, and weighed over a ton. It was a nine days' wonder in the camp, and the people of Cobalt became delirious that night when it was driven into the camp for exhibition.

Exploration shows that northern Ontario promises great wealth, and Cobalt would simply seem to be a key to the most wonderful mineral belt in the world. The silver-field is already about a hundred miles long, and so far the limit has not been reached. During the past year a considerable amount of attention has been directed to the Montreal River (the upper part of the Ottawa River), and silver deposits almost equal to the first discoveries in Cobalt have been found, especially on Lake Gow Ganda and Lake Miller. These lakes are situated about eighty miles north-west of Cobalt, and the first discoveries in Gow Ganda were only made last August. Claims there have been selling for as much as three hundred thousand dollars, and in consequence a stampede has raged, creating a record and almost on a par with the rush to the Yukon. Men, youths, and even boys left their work and rushed there, with no experience of the woods, but stricken with the desire for sudden wealth. Not a few who took part in that frantic scramble will never return. Unprepared for the rigorous climate, entirely ignorant of what they were undertaking, and thinking nothing of how they would survive the freezing nights, these mad specimens of humanity raced onwards like moths to the light. In winter, in that inhospitable wilderness, the mercury often freezes, and the temperature is frequently forty degrees below zero, or seventy degrees of frost. Temporary shelters were erected at intervals on the route, but the accommodation was hopelessly inadequate; and, with the cosmopolitan crew who frequented them, they were overrun with vermin. Provisions and other necessaries of life had to be hurriedly brought, too, during the winter, for after the break-up of the ice on the lakes and rivers transportation is almost impossible. The only method is by canoe, and even then the number of portages renders the journey dishearteningly difficult. Under these circumstances one can imagine the feverish speed with which men and horses sleighed over the snow. The sight of the winter trail was a never-to-be-forgotten one. Endless streams of sleighs and prospectors plodded along through the snow, and at places where the ice had been kept broken for the purpose of watering the horses the temporary halt stopped all the teams behind for a great distance, so close did they follow upon one another.

Nearly every producing mine in Cobalt has some little romance connected with its discovery. There is one which is typical of many. In the early days of the history of the district a young student forsook his books and journeyed from one of the southern universities to seek his fortune in northern Ontario. His father, although he raged at first, decided to allow the boy fifty dollars a month until he 'made good.' The son prospected patiently all that season, but unsuccessfully; and his father came to the conclusion that he was simply idling his time, and stopped his allowance. Nothing daunted, however, the young fellow pluckily worked in a hardware store during the following winter, and succeeded in saving sufficient to enable him to prove his claim when the season reopened. Summer was again over, and autumn tints were colouring the trees, but still he plodded on. The silence on the boy's part made his father anxious, and he paid a visit to his son in the mining-camp. His visit could not have been more opportune. On reaching the claim he saw two prospectors excitedly tapping and examining what was apparently only a piece of rock. He came up unnoticed, and was on the point of addressing his son, when the second man suddenly gave a yell: 'Hurrah! it's the bloom at last!' (bloom—cobalt bloom—a mineralogical test applied to cobalt and silver ores). The boy and his companion leaped up and danced, and in so doing the son recognised his father. The property was eventually sold for one hundred and thirty thousand dollars.

Another case, but of the opposite extreme, was that of a young Englishman who possessed three claims, but eventually confined his energies to one, relinquishing the other two. Not long afterwards two prospectors came along and restaked the derelict claims. The Englishman's property turned out to be worthless, and by some strange irony of

fate the two which he had discarded proved to be extremely valuable, and the lucky finders netted the handsome sum of three hundred thousand dollars.

Mining is not without its tragedies. If some men were offered a fortune for a good claim they would gladly accept it; but one poor prospector wanted more than was offered him. He had a fine showing of native silver in his claim, and in the early summer was offered the sum of one hundred thousand dollars for it. This he declined, naturally imagining it might be worth much more. With a view to developing his showing to better advantage, he put in a shot or two, and instead was overtaken by disaster. The whole thing was blown out, and his claim became worthless as it stood. The silver had only been a patch. What a disillusionment for one who thought he had a fortune in his grasp! We can picture the castles in the air he had built in anticipation of his good fortune, the joy with which he would notify the dear ones at home; and now the whole magnificence was in the dust! Fortune does play scurvy tricks at times!

Canada's experience of the 'rush' to the Yukon caused the Ontario Government to adopt stringent measures when the 'boom' in Cobalt commenced. They determined to make Cobalt a model mining-town so far as the observance of law and order was concerned, and the attempt has been a remarkable success. Drinking-saloons and gambling and other dens of vice were strictly forbidden. The gambling propensity of the miner is a byword. His life is a gamble from start to finish. He sells a claim, realises a fortune, and throws discretion to the winds. The sudden possession of wealth paralyses his mental faculties, and all the animal in him rises to the surface. What a life would be led if Cobalt were an American mining-camp with drinking-saloons! The scum of the earth would be there, murder and robbery would be rife, and in place of the orderly little town we should have a repetition of the wild scenes of early mining-towns elsewhere. Not a murder has taken place since it was founded, and this alone shows that great success may attend a mining-camp without the aid of the usual Wild West 'bad man.'

The town is now assuming quite a modern appearance. It is lighted throughout by electricity, and a water-supply has been installed. The old cabins and dwellings of the prospectors have given place to more substantial and commodious houses, to which the miners can now bring their families with some degree of comfort. All denominations of Churches are well represented, and there is a fine school and a new town-hall. The population to-day is about ten thousand, and the Mayor and aldermen deserve great credit for the high state of respectability to which they have brought the town.

Mining, of course, can never be a permanent industry in any one place. Sooner or later the district becomes worked out; but so long as silver can be mined in Cobalt, so long will the locality continue to flourish. At first geologists and mining experts predicted that Cobalt could only be a surface-camp, and as such only temporary. Their predictions, however, have been completely upset, for the values increase and the veins of silver widen out as they go down. The conclusion that has been come to is that the silver has been forced up from below by volcanic action. The formation of the silver and cobalt deposits is unlike anything occurring elsewhere, and the geological characteristics of the whole district are most peculiar. The veins are in most cases narrow, averaging from a few inches to about a couple of feet, but their richness is the wonder of the world. Some veins are absolutely virgin metal. Nowhere else has silver in the native state been found in such quantities, and it is on account of the richness of the ore that the cost of production is so low. Ore which produces two or three hundred ounces of silver to the ton is thrown on the 'dump,' and this ore is usually the wall-rock of the vein. The rock on either side of a vein is impregnated with silver for two or three feet, so that practically everything taken out of a Cobalt mine is of value. The higher-grade ore is shipped at present, and when it is exhausted the mines will have enough low-grade ore—which, it may be added, would be considered 'Bonanza' ore in Mexico or the States—to keep their mills going for some years. As only about 25 per cent. of the various properties have been prospected, some idea of the magnitude of their resources may be obtained. It is predicted that by the time 'stope' working is commenced in the Cobalt silver-mines Canada will have first place among the silver-producing countries of the world.

As has been already mentioned, great fortunes have been made during the past five years in Cobalt. In individual cases it was merely a question of skilful prospecting or good luck. With the advent, however, of business men and the most approved and skilful methods of mining, fortunes became possible in other ways. We refer to shares in mining companies. In this connection one or two cases may be quoted. A number of gentlemen principally connected with lumbering and farming formed a company in the early days of Cobalt, and capitalised it at twenty-five thousand dollars. A single carload of silver ore would have more than returned every cent invested. They were unfortunate at first, and the stock went down to a few cents in a short time. At last, however, they struck a rich deposit, and the stock went up. It is now two hundred dollars a share, and the company pays 300 per cent. per quarter. It has brought fortunes in dividends to the lucky shareholders, and chagrin to those who sold out at fifteen and twenty cents. Another mine, the Crown Deep, had quite as exciting an experience. At first the stock sold at about twenty cents for a dollar share, but as development-work proceeded it gradually rose till it stood at seventy-five cents a share. When the stock reached that point many holders sold out and netted quite a handsome profit. Soon, however, it began to rise

again, and many who had sold out at seventy-five cents bought in again at a hundred, or par. That stock is now three dollars twelve cents a share, and the company pays 80 per cent. per annum. The manager of a branch of the Bank of Commerce at Cobalt made fifty thousand pounds sterling in a single summer. Every one out there has shares in some mine or other; bank-clerks, journalists, artisans, and even servant-girls speculate. Everybody is money-mad.

Of late we have observed notices in British papers offering investments in Cobalt mines. Our advice is to have nothing to do with them. In many cases the mines are mythical, and exist only on paper or in the imagination of the promoters. The fact that little or no Cobalt stock is offered in any Exchange in this country tells its own tale. It is too eagerly pounced on by those on the spot for any good things to come this length. With that word of warning we close.

By JOHN OXENHAM,

*Author of Barbe of Grand Bayou, Giant Circumstance, John of Gerisau, Great-Heart Gillian, &c.*

## CHAPTER XI.

JACK felt a new sense of freedom as he set foot on Peter Port quay, and great elevation of spirits. The place was alive with many activities. Greetings in harsh-sounding *patois* rattled round Martin as he came up the steps, and jovial congratulations when the success of his run was made known.

He was taking Jack along the front to a café, where he promised to join him at breakfast in a few minutes, when he stopped suddenly in front of a tall, gray-headed man in fisherman's garb who was striding along towards the boats.

'The very man for you,' he said to Jack; and to the other, 'How goes it, Philip? Are you open for a passenger-job—all fair and above-board?'

'We might manage it among us. Where is it to? Is this the passenger?' and his quiet gray eyes took in Jack comprehensively.

'That's him. He wants across to France.'

'It's mostly the other way. The Englishmen in France want across into England. What does an Englishman want into France for?'

'Private business of importance, sir,' said Jack modestly. 'I want to go in and come out again. If you can help me I shall be grateful, and I can pay you well.'

He was a tall, upstanding man, gray-haired and gray-bearded, with a grave, kindly face, and he walked with a slight limp. Jack liked the looks of him. Like draws to like.

'Will you take him to the café there, Philip? And I'll be with you in two minutes. We were going to have some breakfast.' And the patriarchal one turned and walked back along the quay by Jack's side.

'Ever been in France before?' he asked quietly.

'No; and I'm doubtful how I'll get on. But I've got to do what I've come for.'

'You speak good French, however.'

And Jack explained how that came about.

'Is it political matters you're on?'

'No; private entirely. A matter of very great moment—of life and death in fact—to some very dear friends.'

His new acquaintance had breakfasted already, but consented to another cup of coffee while Jack stowed away eggs and bacon as if he had not eaten for a week. By the time Martin came in, after a very long two minutes, they were on quite a friendly footing.

'*Bien!*' said Martin. 'You have come to terms, you two? That is good. You couldn't be in better hands than Philip Carré's if you tried for a month.'

'He will come over to Sercq with me,' said old Philip thoughtfully. 'George Hamon will be able to advise him.'

'No one better. George used to know his way into and out of France as well as most. Since he got married he's dropped out of things.'

'Some things,' said the other with a smile. 'He's become an honest man, you see.'

'Ah, come now, Philip! you wouldn't tell me I'm not an honest man?'

'The honestest free-trader I know. All the same, as you know, I don't hold with the free-trading.'

'You'd have been a richer man if you had, Philip.'

'Depends what you mean by rich. I've got all I want.—When you're ready, Monsieur Sax, we will get on;' and five minutes later they were running out of Peter Port for the blue, whale-backed island which lay basking in the sun across the tumbling shimmer of the racing tides.

They drew in at last to a steep cliff, down which ran wooden ladders to the water, and the old man bade Jack climb carefully, and then turned and busied himself with ropes by means of which he anchored his boat beyond reach of the rocks. Then he joined Jack, who was sitting precariously on the top rung of the ladder, not seeing where to go next.

'This way.' And they passed along a ledge of rock, and caught a rope and hauled themselves up, till they stood on a rough path which led through cushions of gorse to the top of the cliff.

'I must call in here,' said his guide, as they came

abreast of a substantial farmhouse. 'Come in. Jeanne Falla would never forgive me if I took a stranger past her door without a word.' And they stepped into a large room in which were a very wide fireplace, out of which came a pleasant smell, and what looked to Jack like a very large, square bin filled with dry bracken, with dark, oaken sides nearly a foot thick and about two feet high.

A little, old lady, in a large, black-silk sun-bonnet, inside which was a pleasant, sharp face, wrinkled and coloured like a winter apple, was seated on the side of this green bed, busily knitting a very small stocking.

'Well, I should say so,' she said as they entered. 'Whom have you got there, Philip, *mon beau?*'

'It is an Englishman who wants into France, Jeanne Falla.' And Jack made his politest bow.

'*Ma fé*, he must be mad, then! It is out of France the Englishmen want nowadays;' and her bright eyes twinkled on him like a robin's.

'He wants both in and out. Where is Phil, and have you seen George Hamon go past?'

'They are down in Jument hauling *vraic*. They 'll be up for sure when their stomachs tell them it 's dinner-time.'

'And Carette?'

'She 's taken the children to see their other granny. You 'll find her there, unless they 've tumbled into the Saute.'

'And how would you get to Paris and back if you wanted to go, Aunt Jeanne?' he asked gravely.

'*Ma fé!*—Paris!—me! Well, I'd ask George Hamon. He 's the only one hereabouts that knows his way about those parts, and George can see as far into a stone wall as most.'

'We 'll ask him.'

And as they went on across the gorsy headland, with the vast, blue plain of the sea on their left, studded with bristling rocks and distant islands, Jack said to himself that this was a very wonderful change from his high stool in London. But it seemed to him that he had fallen into safe hands, and he felt ready to trust himself to them implicitly.

They came to a smaller farmhouse nestling in the landward hollow of the cliff, and walking in through the open door, came upon a charming family picture.

Leaning upon the solid side of a green bed similar to the one in Jeanne Falla's house, but smaller, were two women, looking down into the enclosure and laughing merrily. Inside were two children — a tiny girl lying on her back on the soft, faded bracken, kicking vigorously with a pair of plump, creasy legs, and bubbling with enjoyment, and a sturdy youngster who was trying to scale the wooden wall and make his escape.

As they entered, the two black silk sun-bonnets turned and disclosed two very sweet faces, one with the rounded contours of maidenhood still in it; the other older, but still very comely and full of quiet happiness.

'*Holá, bisaïeul!*' cried the young mother. 'Come and see the little pigs in their pen.'

'*Mé noh! mé noh!*' jerked the small boy, as he wriggled over the top and came down in a heap on the other side and started for the door, and was swooped upon by his mother and dropped, kicking, into the bed again, with a laughing, '*Ah méchant*, would you?'

Like draws to like, and Jack felt instinctively that here was good company, though how very good he did not then know.

'My daughter, Madame Hamon,' said the old man, with a gesture towards the elder of the two. 'My granddaughter, Madame Carré, and these in the pen are my great-grandchildren. The boy is Phil Carré the Third, and the kicking one is Carette, after her mother.—Monsieur is English,' he explained to the others, as Jack produced his best bows, and the small boy stayed his expostulations to gaze at him. 'He wants to go into France. I thought George would know more about it than any one.'

'They are all down vraicing. They will be up in half-an-hour,' said Madame Hamon, and turned to give an admonitory stir to a big black pot over the fire.

'If not before,' laughed Madame Carré, whom some of us have known as Carette le Marchant before she married Phil Carré. 'Hard work makes hungry men, as Aunt Jeanne would say, and here they come, and as ravenous as congers, I 'll warrant.'

There was a sound of heavy feet outside, and three men came in, all clad alike in rough, blue guernseys and great sea-boots, and all very wet and weary.

'Hello, grandfather!' said the youngest of the three; 'you 've got back? And how 's Peter Port?' and he picked up the small boy, who had set up a shout at sight of him, and gave the little one a ride on his wet knee as he sat on the side of the green bed. He had a strong, pleasant, sunburnt face, and steady, blue eyes, and crisp, light hair. The next was an older man, strong and brown and weather-beaten. The last was the most curious man Jack had ever seen. He was short-built and very powerful-looking. His face was covered with hair, out of which looked two gentle brown eyes like a dog's, and his arms seemed as long as a monkey's.

'Peter Port is all right, Phil—that is, as right as usual.—George, this gentleman wants across into France—to Paris—and out again. How should he go?' And they all stared at Jack. 'What do you advise?'

'Dinner first,' said George Hamon. 'We 're about dead-beat, but we 've got all the *vraic* we want for this year.'

'It 's thick, is it?'

'Piles of it. Good stuff, too.'

The two wives had been quickly spreading the table.

'You will eat with us, monsieur?' asked Madame Hamon, and they all sat down to the meal, Baby Carette jumping and goo-gooing in her mother's arms, and little Phil reluctantly on his grand-

mother's knee, since his father had other matters to attend to at the moment. It did not seem surprising to Jack that the old man said a short grace, though he could not understand a word of it, for he was more conscious every moment that he had fallen among uncommon people.

'The best way,' said George Hamon suddenly, as soon as the edge was off his hunger, 'would be to work across Cotentin,' which he indicated by a nod, 'and Calvados to Honfleur, and then up Seine. That's how we used to get our goods in.—You see,' he said, turning to Jack, 'travelling on water is always freer than it is on land. And they're not as strict in Normandy as they are in some parts. The folk there liked the old way of things better than the new.'

'And how do I get across to Cotentin?'

'We can manage that part all right.—By Surtainville, Phil?'

And young Phil Carré nodded thoughtfully, as though the name held memories for him.

'All the same,' said George Hamon, 'you'll have your own risks. Better rig out as a fisherman, and dirty your hands a bit. Your French will pass muster — in Normandy at all events. What are you going for?'

There is a time to speak and a time to keep silence. It seemed to Jack that this was a time to speak if he wanted the fullest help these good people could give him.

'I'll tell you,' he said, 'on condition that it goes no farther;' and he looked round.

'You may trust us, monsieur,' said old Philip.

'I am sure of it. I am sent to bring home a young lady to her mother, who will die, they say, if she cannot have her back. Bonaparte has refused to let her go since the war broke out.'

'There are many others in the same hole,' said Hamon. 'We have had more than one this way. You'll find it no easy job.'

'I'm afraid not, but I've got to get her home.'

'You'll get her,' said young Madame Phil, with glowing face and sparkling eyes. 'Are you in love with her?'

'Oh madame!' stammered Jack, and strove so hard after equanimity that he went red to the roots of his hair. 'She is very much above me. Her father is rich. I am nobody.'

'All the same!' said Madame Phil with a knowing nod. 'And will she come for your telling? Does she know you?'

'Oh yes. We used to play together, and she will trust me.'

'*C'est ça!*' and Madame Phil nodded her pretty head very many times, as if she had been there herself, and knew quite all about it. 'Let us think now,' she said presently, knitting her smooth brows over the problem. 'You find her. You tell her. How do you get her away? You cannot walk off with her under your arm. She is in Paris.' She may be watched. Anyway, a young fisherman and a fine young lady arm-in-arm would easily be followed.—Phil! Uncle George! Can't you think of any way? *C'est la coue qui est la pière à écorchier*, as Aunt Jeanne says' ('It is the tail that is hardest to flay'—that is, the end of a job is more difficult than the beginning).—'All right, *ma mie*,' to her tiny namesake, who was nuzzling into her neck as if she would bite bits out. 'It is not I who am going off with a young fisherman. We've got all we want, haven't we, my beauty? On your head if you wish, my girl, but don't bite it like that,' as the small one clawed her father's blue stocking-cap off the window-sill behind, and began to make a meal off it at once.

'*C'est ça!*' cried Carette, with sudden illumination. Then, clasping the baby between her knees, she twitched off her black sun-bonnet, and for a moment the room seemed the brighter for the glory of her hair; and then, with a deft twist, she had the stocking-cap on, covering it all to the nape of her neck, and transforming her into an unusually handsome sailor-boy.

'*C'est ça! C'est ça!*' she laughed delightedly. 'You will take with you the clothes of a sailor-boy, and there you are! Mademoiselle disappears, and two nice-looking sailor-boys walk away to the coast.' And her merry brown eyes danced excitedly along theirs.

'That head of yours is as good inside as outside, my little one,' said her young husband, full of admiration.

'That's the way to do it,' said George Hamon. 'If you could get on one of the boats going up to Paris, and come back same way, we may hope to see you again. The water for me, if it's only a river. The land is full of pitfalls.'

And truly it seemed to Jack that this was the way, and that it was opening before him in marvellous fashion.
